Overall Intersection		-	0.43	16.6	B	-	0.79	23.2	C	-	0.84	25.1	C	-	0.80	21.4	C

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Notes

- (1): Control delay is measured in seconds per vehicle.
(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.
(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".
(4): This table has been revised for the Final SEIS.

Notes

- (1): Control delay is measured in seconds per vehicle.
(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.
(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".
(4): This table has been revised for the Final SEIS.

A. INTRODUCTION

This chapter discusses the potential for air quality impacts associated with the proposed project and the Reasonable Worst Case Development Scenario (RWCDS). The analyses presented account for changes to the proposed project and background conditions since the 2008 Final Generic Environmental Impact Statement (FGEIS) for the Willets Point Development Plan and assesses whether any changed background conditions or differences in elements between the proposed project and the development program analyzed in the 2008 FGEIS and subsequent technical memoranda would result in any significant adverse impacts on air quality that were not addressed previously.

The proposed project would create new sources of air pollutant emissions, both mobile (emissions from vehicle trips generated by the proposed project) and stationary (such as exhaust from fossil fuel-fired heating and hot water systems). The maximum hourly traffic generated by the proposed project would exceed the 2012 *City Environmental Quality Review (CEQR) Technical Manual* carbon monoxide (CO) screening threshold of 170 peak hour vehicle trips at an intersection in the study area. In addition, the particulate matter emission screening threshold discussed in Chapter 17, Sections 210 and 311 of the *CEQR Technical Manual* would be exceeded. Therefore, a quantified assessment of the potential impacts on air quality from traffic generated by the proposed project was conducted.

A quantified analysis was also conducted to evaluate potential future CO concentrations in the vicinity of the proposed parking lots, naturally ventilated parking facilities, and ventilation outlets for the proposed parking garages.

The potential for impact on air quality from the heat and hot water systems for the proposed development was analyzed, following the *CEQR Technical Manual* guidance. The proposed project would also introduce new sensitive uses (such as residences and open spaces) near existing sources of emissions. Existing emission sources include existing businesses within the District that emit pollutants of concern. Therefore, the potential for air quality impacts from those existing uses on the proposed uses was evaluated.

PRINCIPAL CONCLUSIONS

Concentrations of carbon monoxide (CO) and fine particulate matter less than 10 microns in diameter (PM₁₀) due to project-generated traffic at intersections near the project site would not result in any violations of National Ambient Air Quality Standards (NAAQS). It was also determined that CO impacts from mobile sources associated with the proposed project would not exceed CEQR *de minimis* criteria. ~~While a Concentration incremental increases in of fine particulate matter less than 2.5 microns in diameter (PM_{2.5}) from mobile sources would be between 2 µg/m³ and 5 µg/m³, were reported in the DSEIS, based on the frequency and magnitude of the concentrations above 2 µg/m³, which will be subject to Since DSEIS certification, further refined analysis was conducted between DSEIS and FSEIS in consultation~~

with DEP. The analysis confirmed that the predicted PM_{2.5} increments from mobile sources associated with the proposed project would not indicate a significant air quality impact. In addition, impacts due to the proposed project's parking facilities were found to result in no significant adverse air quality impacts.

Based on a refined analyses, using conservative assumptions regarding floor area served by a single heating and hot water system stack, there would be no potential for significant adverse air quality impacts from the proposed project's heating and hot water systems (considering buildings proposed for construction in all phases), provided that certain restrictions on the fuel type, placement of heating and hot water system stacks, and use of low-nitrogen oxide (low-NO_x) burners described in Section H, "Probable Impacts of the Proposed Project," are imposed. These restrictions would supersede those identified in the 2008 FGEIS and Technical Memorandum #4. The restrictions reflect the changes to the proposed project since the 2008 FGEIS and subsequent technical memoranda, as well as the promulgation of the 1-hour nitrogen dioxide (NO₂) standard, in 2010. A screening level analysis was conducted to assess whether existing auto, manufacturing, and industrial uses that may remain in the area proposed for development in Phase 2, would have the potential to significantly impact the air quality in the area proposed for development in Phase 1A and Phase 1B, which would be occupied by recreational, residential, hotel, open space, and commercial uses. The results of that analysis show that there would be no potential for significant adverse impact on air quality from these sources on the proposed project. Therefore, there would be no potential for a significant adverse impact from stationary sources.

B. SUMMARY OF FINDINGS—2008 FGEIS AND SUBSEQUENT TECHNICAL MEMORANDA

The 2008 FGEIS considered mobile and stationary sources of air pollutant emissions, including emissions from vehicle trips generated by the Willets Point Development Plan for the District, emissions from vehicles using proposed parking facilities, emissions from fossil fuel use in heating, ventilation, and air conditioning (HVAC) systems, and emissions from existing industrial sources. No potential for air quality impacts was identified, provided that restrictions on HVAC fuel type and stack placement would be implemented. The 2010 update to the *CEQR Technical Manual* included revisions to the HVAC (heating and hot water system) screening analysis procedures. Accordingly, Technical Memorandum #4, included an update to the stack restrictions that resulted in "E-Designations" on the affected properties. In Technical Memorandum #4 the development within the Special Willets Point District was assumed to occur in phases, with the western portion of the District developed first. Technical Memorandum #4 also assumed a "buffer area" between the portion of the District that was to be redeveloped in the initial phase and the rest of the District. This buffer would not be included in the proposed project, and the absence of the buffer would not have the potential to result in significant adverse air quality impacts as described in this chapter.

C. POLLUTANTS FOR ANALYSIS

Ambient air quality is affected by air pollutants produced by both motor vehicles and stationary sources. Emissions from motor vehicles are referred to as mobile source emissions, while emissions from fixed facilities are referred to as stationary source emissions. Ambient concentrations of carbon monoxide (CO) are predominantly influenced by mobile source emissions. Particulate matter (PM), volatile organic compounds (VOCs), and nitrogen oxides (NO and NO₂, collectively referred to as NO_x) are emitted from both mobile and stationary sources. Fine PM is also formed when emissions of

NO_x, sulfur oxides (SO_x), ammonia, organic compounds, and other gases react or condense in the atmosphere. Emissions of sulfur dioxide (SO₂) are associated mainly with stationary sources, and some sources utilizing non-road diesel, such as large international marine vessels. On-road diesel vehicles currently contribute very little to SO₂ emissions since the sulfur content of on-road diesel fuel, which is federally regulated, is extremely low. Ozone is formed in the atmosphere by complex photochemical processes that include NO_x and VOCs. Ambient concentrations of CO, PM, NO₂, SO₂, and lead are regulated by the U.S. Environmental Protection Agency (USEPA) under the Clean Air Act, and are referred to as “criteria pollutants,” emissions of VOCs, NO_x, and other precursors to criteria pollutants are also regulated by USEPA.

CARBON MONOXIDE

CO, a colorless and odorless gas, is produced in the urban environment primarily by the incomplete combustion of gasoline and other fossil fuels. In urban areas, approximately 80 to 90 percent of CO emissions are from motor vehicles. Since CO is a reactive gas which does not persist in the atmosphere, CO concentrations can vary greatly over relatively short distances; elevated concentrations are usually limited to locations near crowded intersections, heavily traveled and congested roadways, parking lots, and garages. Consequently, CO concentrations must be predicted on a local, or microscale, basis.

The proposed project would result in changes in traffic patterns and an increase in traffic volumes. Therefore, a mobile source analysis was conducted at critical intersections to evaluate future CO concentrations with and without the proposed project. An analysis was also conducted to evaluate future CO concentrations with the operation of proposed parking facilities.

NITROGEN OXIDES, VOCs, AND OZONE

NO_x are of principal concern because of their role, together with VOCs, as precursors in the formation of ozone. Ozone is formed through a series of reactions that take place in the atmosphere in the presence of sunlight. Because the reactions are slow, and occur as the pollutants are advected downwind, elevated ozone levels are often found many miles from sources of the precursor pollutants. The effects of NO_x and VOC emissions from all sources are therefore generally examined on a regional basis. The contribution of any project to regional emissions of these pollutants would include any added stationary or mobile source emissions. The proposed project would not have a significant effect on the overall volume of vehicular travel in the metropolitan area; therefore, no measurable impact on regional NO_x emissions or on ozone levels is predicted. A regional analysis of emissions of these pollutants from mobile sources associated with the proposed project was therefore not warranted.

In addition to being a precursor to the formation of ozone, NO₂ (one component of NO_x) is also a regulated criteria pollutant. Since NO₂ is mostly formed from the transformation of NO in the atmosphere, it has mostly been of concern further downwind from large stationary point sources, and not a local concern from mobile sources. (NO_x emissions from fuel combustion consist of approximately 90 percent NO and 10 percent NO₂ at the source.) However, with the promulgation of the 2010 1-hour average standard for NO₂, local sources such as vehicular emissions may become of greater concern for this pollutant.

An assessment of NO_x emissions from stationary sources was conducted, following the *CEQR Technical Manual* and USEPA guidance. In order to evaluate the effect of mobile source emissions due to the proposed actions, predicted mobile source pollutant concentrations at affected roadways and intersections must be added to background concentrations. Community-scale monitors currently in operation can be used to represent background NO₂ conditions away

from roadways, but there is substantial uncertainty regarding background concentrations at or near ground-level locations in close proximity to roadways. USEPA estimates that concentrations near roadways may be anywhere from 30 to 100 percent higher than those measured at community-scale monitors. Furthermore, the existing USEPA mobile source models are not capable of assessing the chemical transformation of emitted NO to NO₂ over relatively short distances (e.g., sidewalks, low-floor windows). In addition, existing USEPA mobile source models are designed to provide only peak concentrations, which are not consistent with the statistical format of the 1-hour average NO₂ standard.

Given the current uncertainty regarding background concentrations at specific locations near roadways, and the lack of approved modeling protocols for the prediction of total maximum 1-hour daily 98th percentile NO₂ concentrations, as well as the lack of a benchmark for evaluating the significance of these incremental concentrations, no methodology exists that could provide reasonable predictions about concentrations from mobile sources due to the proposed project on the receptors at or near ground-level locations. The traffic associated with the proposed project is not expected to change NO₂ concentrations appreciably, since the vehicular traffic associated with the proposed project would be a very small percentage of the total number of vehicles in the area. The amount of NO emitted that would rapidly transform to NO₂ in the immediate vicinity of roadways and intersections with project-generated traffic would be very small. It is not known whether conditions in the future condition without the proposed project will be within or in excess of the NAAQS in these near-road areas. Background concentrations are in fact expected to decrease over time and local sources would contribute an incremental amount of NO₂ to those background concentrations. The analysis limitations described above preclude the performance of an accurate quantitative assessment of the significance of the 1-hour NO₂ increments from the increase in traffic resulting from the proposed project.

LEAD

Currently, airborne lead emissions are principally associated with industrial sources. Lead in gasoline has been banned under the Clean Air Act, and is not a pollutant of concern for the proposed project.

RESPIRABLE PARTICULATE MATTER—PM₁₀ AND PM_{2.5}

PM is a broad class of air pollutants that includes discrete particles of a wide range of sizes and chemical compositions, as either liquid droplets (aerosols) or solids suspended in the atmosphere. The constituents of PM are both numerous and varied, and they are emitted from a wide variety of sources (both natural and anthropogenic). Natural sources include the condensed and reacted forms of naturally occurring VOCs; salt particles resulting from the evaporation of sea spray; wind-borne pollen, fungi, molds, algae, yeasts, rusts, bacteria, and material from live and decaying plant and animal life; particles eroded from beaches, soil, and rock; and particles emitted from volcanic and geothermal eruptions and from forest fires. Naturally occurring PM is generally greater than 2.5 micrometers in diameter. Major anthropogenic sources include the combustion of fossil fuels (e.g., vehicular exhaust, power generation, boilers, engines, and home heating), chemical and manufacturing processes, all types of construction, agricultural activities, as well as wood-burning stoves and fireplaces. PM also acts as a substrate for the adsorption of other pollutants, often toxic and some likely carcinogenic compounds.

As described below, PM is regulated in two size categories: particles with an aerodynamic diameter of less than or equal to 2.5 micrometers, or PM_{2.5}, and particles with an aerodynamic diameter of less than or equal to 10 micrometers, or PM₁₀, which includes the smaller PM_{2.5}. PM_{2.5} has the ability to reach the lower regions of the respiratory tract, delivering with it other

compounds that adsorb to the surfaces of the particles, and is also extremely persistent in the atmosphere. PM_{2.5} is mainly derived from combustion material that has volatilized and then condensed to form primary PM (often soon after the release from an exhaust pipe or stack) or from precursor gases reacting in the atmosphere to form secondary PM.

Diesel-powered vehicles, especially heavy duty trucks and buses, are a significant source of respirable PM, most of which is PM_{2.5}; PM concentrations may, consequently, be locally elevated near roadways with high volumes of heavy diesel powered vehicles. The proposed project would result in traffic exceeding the PM_{2.5} vehicle emission screening analysis thresholds as defined in Chapter 17, Sections 210 and 311 of the *CEQR Technical Manual*. The proposed project's heating and hot water systems would use natural gas, if operating on fossil fuel. Following the guidance of the *CEQR Technical Manual*, NO₂ is the critical pollutant of concern with the use of natural gas. Therefore, an analysis of PM₁₀ and PM_{2.5} emissions from the heating and hot water systems was not warranted.

SULFUR DIOXIDE

SO₂ emissions are primarily associated with the combustion of sulfur-containing fuels (oil and coal). Monitored SO₂ concentrations in New York City do not exceed national standards. SO₂ is also of concern as a precursor to PM_{2.5} and is regulated as a PM_{2.5} precursor under the New Source Review permitting program for large sources. Due to the federal restrictions on the sulfur content in diesel fuel for on-road and non-road vehicles, no significant quantities are emitted from vehicular sources. Vehicular sources of SO₂ are not significant and therefore, analysis of SO₂ from mobile and non-road sources was not warranted. As part of the proposed project, the only fossil fuel permitted for use in the heating and hot water systems would be natural gas. The sulfur content of natural gas is negligible; therefore, an analysis of future levels of SO₂ from the proposed heating and hot water systems was not warranted.

NONCRITERIA POLLUTANTS

In addition to the criteria pollutants discussed above, noncriteria pollutants may be of concern. Noncriteria pollutants are emitted by a wide range of man-made and naturally occurring sources. These pollutants are sometimes referred to as hazardous air pollutants (HAP) and when emitted from mobile sources, as Mobile Source Air Toxics (MSATs). Emissions of noncriteria pollutants from industries are regulated by USEPA. The existing industrial and auto uses within the proposed project study area were analyzed as potential sources of noncriteria pollutant emissions.

D. AIR QUALITY REGULATIONS, STANDARDS, AND BENCHMARKS

NATIONAL AND STATE AIR QUALITY STANDARDS

As required by the CAA, primary and secondary National Ambient Air Quality Standards (NAAQS) have been established for six major air pollutants: CO, NO₂, ozone, respirable PM (both PM_{2.5} and PM₁₀), SO₂, and lead. The primary standards represent levels that are requisite to protect the public health, allowing an adequate margin of safety. The secondary standards are intended to protect the nation's welfare, and account for air pollutant effects on soil, water, visibility, materials, vegetation, and other aspects of the environment. The primary and secondary standards are the same for NO₂ (annual), ozone, lead, PM_{2.5} (24-hr) and PM₁₀, and there is no secondary standard for CO and the 1-hour NO₂ standard. The NAAQS are presented in **Table 15-1**. The NAAQS for CO, annual NO₂, and 3-hour SO₂ have also been adopted as the ambient air quality standards for New York State, but are defined on a running 12-month basis

Table 15-1
National Ambient Air Quality Standards (NAAQS)

Pollutant	Primary		Secondary	
	ppm	µg/m ³	ppm	µg/m ³
Carbon Monoxide (CO)				
8-Hour Average ⁽¹⁾	9	10,000	None	
1-Hour Average ⁽¹⁾	35	40,000		
Lead				
Rolling 3-Month Average ⁽²⁾	NA	0.15	NA	0.15
Nitrogen Dioxide (NO ₂)				
1-Hour Average ⁽³⁾	0.100	188	None	
Annual Average	0.053	100	0.053	100
Ozone (O ₃)				
8-Hour Average ^(4,5)	0.075	150	0.075	150
Respirable Particulate Matter (PM ₁₀)				
24-Hour Average ⁽¹⁾	NA	150	NA	150
Fine Respirable Particulate Matter (PM _{2.5})				
Annual Mean ⁽⁶⁾	NA	12	NA	15
24-Hour Average ⁽⁷⁾	NA	35	NA	35
Sulfur Dioxide (SO ₂) ⁽⁸⁾				
1-Hour Average ⁽⁹⁾	0.075	197	NA	NA
Maximum 3-Hour Average ⁽¹⁾	NA	NA	0.50	1,300
Notes: ppm – parts per million (unit of measure for gases only) µg/m ³ – micrograms per cubic meter (unit of measure for gases and particles, including lead) NA – not applicable All annual periods refer to calendar year. Standards are defined in ppm. Approximately equivalent concentrations in µg/m ³ are presented. ⁽¹⁾ Not to be exceeded more than once a year. ⁽²⁾ USEPA has lowered the NAAQS down from 1.5 µg/m ³ , effective January 12, 2009. ⁽³⁾ 3-year average of the annual 98th percentile daily maximum 1-hr average concentration. Effective April 12, 2010. ⁽⁴⁾ 3-year average of the annual fourth highest daily maximum 8-hr average concentration. ⁽⁵⁾ USEPA has proposed lowering the primary standard further to within the range 0.060-0.070 ppm, and adding a secondary standard measured as a cumulative concentration within the range of 7 to 15 ppm-hours aimed mainly at protecting sensitive vegetation. A final decision on this standard has been postponed but is expected to occur in 2013. ⁽⁶⁾ USEPA has lowered the primary standard from 15 µg/m ³ , effective March 2013. ⁽⁷⁾ Not to be exceeded by the annual 98th percentile when averaged over 3 years. ⁽⁸⁾ USEPA revoked the 24-hour and annual primary standards, replacing them with a 1-hour average standard. Effective August 23, 2010. ⁽⁹⁾ 3-year average of the annual 99th percentile daily maximum 1-hr average concentration. Source: 40 CFR Part 50: National Primary and Secondary Ambient Air Quality Standards.				

rather than for calendar years only. New York State also has standards for total suspended particulate matter (TSP), settleable particles, non-methane hydrocarbons (NMHC), 24-hour and annual SO₂, and ozone which correspond to federal standards that have since been revoked or replaced, and for the noncriteria pollutants beryllium, fluoride, and hydrogen sulfide. USEPA has revised the NAAQS for PM, effective December 18, 2006. The revision included lowering the level of the 24-hour PM_{2.5} standard from 65 µg/m³ to 35 µg/m³ and retaining the level of the annual standard at 15 µg/m³. The PM₁₀ 24-hour average standard was retained and the annual average PM₁₀ standard was revoked. USEPA recently announced a final decision to lower the primary annual-average standard from 15 µg/m³ to 12 µg/m³, effective March 2013.

USEPA has also revised the 8-hour ozone standard, lowering it from 0.08 to 0.075 parts per million (ppm), effective as of May 2008. On January 6, 2010, USEPA proposed a change in the 2008 ozone NAAQS, lowering the primary NAAQS from the current 0.075 ppm level to within the range of 0.060 to 0.070 ppm. USEPA is also proposing a secondary ozone standard, measured as a cumulative concentration within the range of 7 to 15 ppm-hours aimed mainly at protecting sensitive vegetation. A final decision on this standard has been postponed but is expected to occur in 2013.

USEPA lowered the primary and secondary standards for lead to 0.15 µg/m³, effective January 12, 2009. USEPA revised the averaging time to a rolling 3-month average and the form of the standard to not-to-exceed across a 3-year span.

USEPA established a 1-hour average NO₂ standard of 0.100 ppm, effective April 12, 2010, in addition to the annual standard. The statistical form is the 3-year average of the 98th percentile of daily maximum 1-hour average concentration in a year.

USEPA also established a 1-hour average SO₂ standard of 0.075 ppm, replacing the 24-hour and annual primary standards, effective August 23, 2010. The statistical form is the 3-year average of the 99th percentile of the annual distribution of daily maximum 1-hour concentrations (the 4th highest daily maximum corresponds approximately to 99th percentile for a year.)

Federal ambient air quality standards do not exist for noncriteria pollutants; however, as mentioned above, the New York State Department of Environmental Conservation (NYSDEC) has issued standards for three noncriteria compounds. NYSDEC has also developed a guidance document DAR-1 (October 2010)¹, which contains a compilation of annual and short term (1-hour) guideline concentrations for numerous other noncriteria compounds. The NYSDEC guidance thresholds represent ambient levels that are considered safe for public exposure.

NAAQS ATTAINMENT STATUS AND STATE IMPLEMENTATION PLANS

The CAA, as amended in 1990, defines non-attainment areas (NAA) as geographic regions that have been designated as not meeting one or more of the NAAQS. When an area is designated as non-attainment by USEPA, the state is required to develop and implement a State Implementation Plan (SIP), which delineates how a state plans to achieve air quality that meets the NAAQS under the deadlines established by the Clean Air Act, followed by a plan for maintaining attainment status once the area is in attainment.

In 2002, USEPA re-designated New York City as in attainment for CO. Under the resulting maintenance plan, New York City is committed to implementing site-specific control measures

¹ New York State Department of Environmental Conservation DAR-1 (Air Guide-1) AGC/SGC Tables, October 2010.

throughout the city to reduce CO levels, should unanticipated localized growth result in elevated CO levels during the maintenance period.

Manhattan has been designated as a moderate NAA for PM₁₀. On January 30, 2013, New York State requested that USEPA approve its withdrawal of the 1995 SIP and redesignation request for the 1987 PM₁₀ NAAQS, and that USEPA make a clean data finding instead, based on data monitored from 2009-2011 indicating PM₁₀ concentrations well below the 1987 NAAQS. Although not yet a redesignation to attainment status, if approved, this determination would remove further requirements for related SIP submissions.

On December 17, 2004, USEPA took final action designating the five New York City counties and Nassau, Suffolk, Rockland, Westchester, and Orange Counties as a PM_{2.5} non-attainment area under the Clean Air Act due to exceedance of the annual average standard. Based on recent monitoring data (2006-2009), annual average concentrations of PM_{2.5} in New York City no longer exceed the annual standard. USEPA has determined that the area has attained the 1997 annual PM_{2.5} NAAQS, effective December 15, 2010. New York State submitted a redesignation request and maintenance plan to USEPA in February 2013. As stated earlier, USEPA has recently lowered the annual average primary standard to 12 µg/m³. USEPA will make initial attainment designations by December 2014. Based on analysis of 2009–2011 monitoring data, it is likely that the region will be in attainment for the new standard.

As described above, USEPA has revised the 24-hour average PM_{2.5} standard. In November 2009, USEPA designated the New York City Metropolitan Area as nonattainment with the 2006 24-hour PM_{2.5} NAAQS. The nonattainment area includes the same 10-county area originally designated as nonattainment with the 1997 annual PM_{2.5} NAAQS. Based on recent monitoring data (2007–2011), USEPA determined that the area has attained the standard. Although it has not yet been redesignated to attainment status, this determination removes further requirements for related SIP submissions. New York State submitted a redesignation request and maintenance plan to USEPA in February 2013.

The five New York City counties, Nassau, Rockland, Suffolk, Westchester, Lower Orange County Metropolitan Area (LOCMA) had been designated as a severe non-attainment area (the New York-New Jersey-Long Island Nonattainment Area, New York portion) for ozone (1-hour average standard, 0.12 ppm). In November 1998, New York State submitted its *Phase II Alternative Attainment Demonstration for Ozone*, which was finalized and approved by USEPA effective March 6, 2002, addressing attainment of the 1-hour ozone NAAQS by 2007. The 1-hour standard was revoked in 2004 when it was replaced by the 8-hour ozone standard, but certain further requirements remained ('anti-backsliding'). On June 18, 2012, USEPA determined that the New York-New Jersey-Long Island NAA has also attained the standard. Although it has not yet been redesignated to attainment status, this determination removes further requirements under the 1-hour standard.

Effective June 15, 2004, USEPA designated the five New York City counties, Nassau, Rockland, Suffolk, Westchester, Lower Orange County Metropolitan Area (LOCMA) as moderate non-attainment for the 1997 8-hour average ozone standard. On February 8, 2008, NYSDEC submitted final revisions to the SIP to USEPA to address the 1997 8-hour ozone standard. Based on recent monitoring data (2007–2011), USEPA determined that the Poughkeepsie and the NY-NJ-CT areas have attained the 1997 8-hour ozone NAAQS (0.08 ppm). Although it has not yet been redesignated to attainment status, this determination removes further requirements under the 1997 8-hour standard. In March 2008 USEPA strengthened the 8-hour ozone standards. USEPA designated the counties of Suffolk, Nassau, Bronx, Kings, New

York, Queens, Richmond, Rockland, and Westchester (NY portion of the New York-Northern New Jersey-Long Island, NY-NJ-CT NAA) as a marginal non-attainment area for the 2008 ozone NAAQS, effective July 20, 2012. SIPs will be due in 2015.

New York City is currently in attainment of the annual-average NO₂ standard. USEPA has designated the entire state of New York as “unclassifiable/attainment” of the new 1-hour NO₂ standard effective February 29, 2012. Since additional monitoring is required for the 1-hour standard, areas will be reclassified once three years of monitoring data are available (2016 or 2017).

USEPA has established a 1-hour SO₂ standard, replacing the former 24-hour and annual standards, effective August 23, 2010. Based on the available monitoring data, all New York State counties currently meet the 1-hour standard. Additional monitoring will be required. ~~USEPA plans to make final attainment designations in June 2013. SIPs for nonattainment areas will be due by June 2015.~~ Draft attainment designations were published by USEPA in February 2013, indicating that USEPA is deferring action to designate areas in New York and expects to proceed with designations once additional data are gathered.

DETERMINING THE SIGNIFICANCE OF AIR QUALITY IMPACTS

The State Environmental Quality Review Act (SEQRA) regulations and the *CEQR Technical Manual* state that the significance of a predicted consequence of a project (i.e., whether it is material, substantial, large or important) should be assessed in connection with its setting (e.g., urban or rural), its probability of occurrence, its duration, its irreversibility, its geographic scope, its magnitude, and the number of people affected.¹ In terms of the magnitude of air quality impacts, any action predicted to increase the concentration of a criteria air pollutant to a level that would exceed the concentrations defined by the NAAQS (see **Table 15-1**) would be deemed to have a potential significant adverse impact. Similarly, for non-criteria pollutants, predicted exceedance of the DAR-1 guideline concentrations would be considered a potential significant adverse impact.

In addition, in order to maintain concentrations lower than the NAAQS in attainment areas, or to ensure that concentrations will not be significantly increased in non-attainment areas, threshold levels have been defined for certain pollutants; any action predicted to increase the concentrations of these pollutants above the thresholds would be deemed to have a potential significant adverse impact, even in cases where violations of the NAAQS are not predicted.

DE MINIMIS CRITERIA REGARDING CO IMPACTS

New York City has developed *de minimis* criteria to assess the significance of the increase in CO concentrations that would result from the impact of proposed projects or actions on mobile sources, as set forth in the *CEQR Technical Manual*. These criteria set the minimum change in CO concentration that defines a significant environmental impact. Significant increases of CO concentrations in New York City are defined as: (1) an increase of 0.5 ppm or more in the maximum 8-hour average CO concentration at a location where the predicted No Action 8-hour concentration is equal to or between 8 and 9 ppm; or (2) an increase of more than half the difference between baseline (i.e., No Action) concentrations and the 8-hour standard, when No Action concentrations are below 8.0 ppm.

¹ *CEQR Technical Manual*, Chapter 1, section 222, June 2012; and State Environmental Quality Review Regulations, 6 NYCRR § 617.7

~~PM_{2.5} INTERIM GUIDANCE CRITERIA-DE MINIMIS CRITERIA REGARDING PM_{2.5} IMPACTS~~

~~NYSDEC has published a policy to provide interim direction for evaluating PM_{2.5} impacts.¹ This policy applies only to facilities applying for permits or major permit modifications under SEQRA that emit 15 tons of PM₁₀ or more annually. The policy states that such a project will be deemed to have a potentially significant adverse impact if the project's maximum impacts are predicted to increase PM_{2.5} concentrations by more than 0.3 µg/m³ averaged annually or more than 5 µg/m³ on a 24 hour basis. Projects that exceed either the annual or 24 hour threshold will be required to prepare an EIS to assess the severity of the impacts, to evaluate alternatives, and to employ reasonable and necessary mitigation measures to minimize the PM_{2.5} impacts of the source to the maximum extent practicable.~~

~~In addition, The monitored background levels of PM_{2.5} have come down appreciably in recent years. As of June 5, 2013, New York City uses interim guidance the following *de minimis* criteria for evaluating the potential PM_{2.5} impacts for projects subject to CEQR. The *de minimis* criteria supersede the interim guidance criteria currently that were previously in effect. employed to determine the potential for significant adverse PM_{2.5} impacts under CEQR are as follows:~~

- ~~• 24 hour average PM_{2.5} concentration increments which are predicted to be greater than 5 µg/m³ at a discrete receptor location would be considered a significant adverse impact on air quality under operational conditions (i.e., a permanent condition predicted to exist for many years regardless of the frequency of occurrence);~~
- ~~• 24 hour average PM_{2.5} concentration increments which are predicted to be greater than 2 µg/m³ but no greater than 5 µg/m³ would be considered a significant adverse impact on air quality based on the magnitude, frequency, duration, location, and size of the area of the predicted concentrations;~~
- ~~• Predicted increase of more than half the difference between the background concentration and the 24-hour standard; or~~
- ~~• Predicted annual average PM_{2.5} concentration increments which are predicted to be greater than 0.1 µg/m³ at ground level on a neighborhood scale (i.e., the annual increase in concentration representing the average over an area of approximately 1 square kilometer, centered on the location where the maximum ground-level impact is predicted for stationary sources; or at a distance from a roadway corridor similar to the minimum distance defined for locating neighborhood scale monitoring stations); or~~
- ~~• Predicted annual average PM_{2.5} concentration increments which are predicted to be greater than 0.3 µg/m³ at a discrete receptor location (elevated or ground level).~~

~~Actions under CEQR predicted to increase PM_{2.5} concentrations by more than the above interim guidance *de minimis* criteria will be considered to have a potential significant adverse impact.~~

~~The proposed project's annual emissions of PM₁₀ are estimated to be well below the 15 ton per year threshold under NYSDEC's PM_{2.5} policy guidance. The above interim guidance criteria have been used to evaluate the significance of predicted impacts of the proposed project on PM_{2.5} concentrations.~~

¹ CP33/Assessing and Mitigating Impacts of Fine Particulate Emissions, NYSDEC 12/29/2003.

E. METHODOLOGY FOR PREDICTING POLLUTANT CONCENTRATIONS

INTRODUCTION

This section presents the methodologies, data, and assumptions used to conduct the air quality analyses for the proposed project. The following analyses were conducted.

MOBILE SOURCE ANALYSIS

Assessment of the change in CO and PM concentrations as a result of changes in traffic volumes and geometry due to the proposed project (one intersection in Phase 1A to account for Willets West and development within the District by 2018, prior to completion of Van Wyck ramps; and two intersections in Phase 2 to account for the full program proposed by 2032). As discussed in the DSEIS, and described in the following text, a more refined analysis was conducted for the intersection and time period that resulted in the greatest increase in PM_{2.5} concentrations. The Phase 1B development would occur after the completion of the Van Wyck ramps and would generate less traffic than the full program proposed by 2032. Therefore, Phase 1B would result in fewer mobile source emissions and less potential for an impact on air quality than Phase 2, and a quantified mobile source analysis was not conducted for Phase 1B.

PARKING FACILITIES

Assessment of the potential impacts associated with the proposed parking uses (the Willets West garage for Phase 1A and the proposed convention center garage within the District in Phase 2).

STATIONARY SOURCE ANALYSIS

Assessment of the potential impacts from the fossil fuel-fired heating and hot water systems for the proposed project (as proposed with the completion of Phase 2, in 2032).

Assessment of the potential impacts from existing businesses/industrial sources on the proposed project (business in Phase 2 area that could potentially affect Phase 1A / Phase 1B development).

MOBILE SOURCES

The prediction of vehicle-generated emissions and their dispersion in an urban environment incorporates meteorological phenomena, traffic conditions, and physical configuration. Air pollutant dispersion models mathematically simulate how traffic, meteorology, and physical configuration combine to affect pollutant concentrations. The mathematical expressions and formulations contained in the various models attempt to describe an extremely complex physical phenomenon as closely as possible. However, because all models contain simplifications and approximations of actual conditions and interactions, and since it is necessary to predict the reasonable worst-case condition, most dispersion analyses predict conservatively high concentrations of pollutants, particularly under adverse meteorological conditions.

The mobile source analysis for the proposed project employs a model approved by USEPA that has been widely used for evaluating air quality impacts of projects in New York City, other parts of New York State, and throughout the country. The modeling approach includes a series of conservative assumptions relating to meteorology, traffic, and background concentration levels resulting in a conservatively high estimate of expected pollutant concentrations that could ensue from the proposed project.

VEHICLE EMISSIONS

Engine Emissions

Vehicular CO, PM₁₀, and PM_{2.5} engine emission factors were computed using the USEPA mobile source emissions model, MOVES.¹ This emissions model is capable of calculating engine emission factors for various vehicle types, based on the fuel type (gasoline, diesel, or natural gas), meteorological conditions, vehicle speeds, vehicle age, roadway type and grade, number of starts per day, engine soak time, and various other factors that influence emissions, such as inspection maintenance programs. The inputs and use of MOVES incorporate the most current guidance available from USEPA and NYSDEC.

Vehicle classification data were based on field studies obtained as part of the traffic data collections summarized in Chapter 14, "Transportation." Appropriate credits were used to accurately reflect the inspection and maintenance program. The inspection and maintenance programs require inspections of automobiles and light trucks to determine if pollutant emissions from each vehicle exhaust system comply with emission standards. Vehicles failing the emissions test must undergo maintenance and pass a repeat test to be registered in New York State. County-specific hourly temperature and relative humidity data obtained from NYSDEC were used.

Road Dust

The contribution of re-entrained road dust to PM₁₀ concentrations, as presented in the PM₁₀ SIP, is considered to be significant; therefore, the PM₁₀ estimates include both exhaust and road dust. ~~In accordance with the PM_{2.5} interim guidance criteria methodology,~~ PM_{2.5} emission rates were determined with fugitive road dust to account for their impacts in local microscale analyses. However, fugitive road dust was not included in the annual neighborhood scale PM_{2.5} microscale analyses, since the New York Department of Environment Protection (DEP) considers it to have an insignificant contribution on that scale. Road dust emission factors were calculated according to the latest procedure delineated by USEPA² and the 2012 *CEQR Technical Manual*.

DISPERSION MODELS FOR MICROSCALE ANALYSIS

Maximum CO concentrations resulting from vehicular emissions adjacent to the analysis sites were predicted using the CAL3QHC model Version 2.0.³ The CAL3QHC model employs a Gaussian (normal distribution) dispersion assumption and includes an algorithm for estimating vehicular queue lengths at signalized intersections. CAL3QHC predicts emissions and dispersion of CO from idling and moving vehicles. The queuing algorithm includes site-specific traffic parameters, such as signal timing and delay calculations (from the 2000 *Highway Capacity Manual* traffic forecasting model), saturation flow rate, vehicle arrival type, and signal actuation (i.e., pre-timed or actuated signal) characteristics to accurately predict the number of idling vehicles. The CAL3QHC model has been updated with an extended module, CAL3QHCR, which allows for the incorporation of hourly meteorological data into the modeling, instead of

² EPA, Compilations of Air Pollutant Emission Factors AP-42, Fifth Edition, Volume I: Stationary Point and Area Sources, Ch. 13.2.1, NC, <http://www.epa.gov/ttn/chief/ap42>, January 2011.

³ EPA, User's Guide to CAL3QHC, A Modeling Methodology for Predicted Pollutant Concentrations Near Roadway Intersections, Office of Air Quality, Planning Standards, Research Triangle Park, North Carolina, EPA-454/R-92-006.

worst-case assumptions regarding meteorological parameters. This refined version of the model, CAL3QHCR, can be employed if maximum predicted future CO concentrations are greater than the applicable ambient air quality standards or when *de minimis* thresholds are exceeded using the first level of CAL3QHC modeling and was applied for PM₁₀ and PM_{2.5} concentrations on sidewalks near the project sites. This refined version of the CAL3QHC model can utilize hourly traffic and meteorological data, and is therefore appropriate for calculating the 24-hour and annual average concentrations required to address the timescales of the PM NAAQS.

METEOROLOGY

In general, the transport and concentration of pollutants from vehicular sources are influenced by three principal meteorological factors: wind direction, wind speed, and atmospheric stability. Wind direction influences the direction in which pollutants are dispersed, and atmospheric stability accounts for the effects of vertical mixing in the atmosphere. These factors, therefore, influence the concentration at a particular prediction location (receptor). In applying the CAL3QHC model, the wind angle was varied to determine the wind direction resulting in the maximum concentrations at each receptor. Following the USEPA guidelines,¹ CAL3QHC computations were performed using a wind speed of 1 meter per second, and the neutral stability class D. The 8-hour average CO concentrations were estimated by multiplying the predicted 1-hour average CO concentrations by a factor of 0.70 to account for persistence of meteorological conditions per the 2012 *CEQR Technical Manual* guidance. A surface roughness of 3.21 meters was chosen. At each receptor location, concentrations were calculated for all wind directions, and the highest predicted concentration was reported, regardless of frequency of occurrence. These assumptions ensured that worst-case meteorology was used to estimate impacts.

Using the CAL3QHCR model, hourly concentrations were predicted based on hourly traffic data and five years (2007–2011) of monitored hourly meteorological data. The data consist of surface data collected at LaGuardia Airport and upper air data collected at Brookhaven, New York. All hours were modeled, and the highest resulting concentration for each averaging period is presented.

ANALYSIS YEAR

An analysis was performed for Phase 1A's Build Year of 2018, to account for the construction of Willets West, which was previously not considered, as well as to account for the fact that the construction of the new Van Wyck ramps would not be completed before the operation of Phase 1A. An analysis was also performed to assess the potential for mobile source impacts from the operation of the fully build project as proposed with Phase 2, in 2032. No analysis was conducted for Phase 1B, because the project generated traffic in that phase would be well below that projected for Phase 2, and because the Van Wyck ramps would be completed before the uses constructed by 2028 in Phase 1B would be occupied.

TRAFFIC DATA

Traffic data for the air quality analysis were derived from existing traffic counts, projected future growth in traffic, and other information developed as part of the traffic analysis for the proposed project (see Chapter 14, "Transportation"). Traffic data for the future without and with the proposed project were used in the respective air quality modeling scenarios. The data for the

¹ *Guidelines for Modeling Carbon Monoxide from Roadway Intersections*, EPA Office of Air Quality Planning and Standards, Publication EPA-454/R-92-005.

future with the proposed project accounted for traffic associated with the cumulative development with Lot B. Two peak periods were analyzed to assess the impact of weekend midday peak traffic, with and without a game event at CitiField. The weekend (1:30 PM to 2:30 PM) and weekend pre-game (3:15 PM to 4:15 PM) peak periods were analyzed. The weekend non-game time period was selected for the mobile source analysis because it would result in the maximum anticipated project-generated and total future traffic at signalized intersections and, therefore, have the greatest potential for significant air quality impacts. Of the peak periods with game events, the weekend pre-game peak period was analyzed because it is the game day peak period with the greatest amount of project-generated traffic.

Since the PM analysis requires hourly traffic data over an entire 24-hour period, it was necessary to estimate this information for the non-peak traffic periods. The projected weekend peak traffic volumes in the future without the proposed project were used as a baseline. Traffic volumes for other hours without the proposed project were determined by adjusting the peak period volumes by the 24-hour distributions based on the Automatic Traffic Recorder (ATR) data. Traffic generated by the proposed project over the 24-hour period was similarly determined using the predicted hourly parking accumulation data, obtained from the traffic analysis.

BACKGROUND CONCENTRATIONS

Background concentrations are those pollutant concentrations originating from distant sources that are not directly included in the modeling analysis, which directly accounts for vehicular emissions on the streets within 1,000 feet and in the line of sight of the analysis site. Background concentrations are added to modeling results to obtain total pollutant concentrations at an analysis site. The 1-hour and 8-hour CO background concentrations used in this analysis, which were based on the maximum second-highest concentrations recorded at the NYSDEC Queens College 2 monitoring station from 2007 to 2011, were ~~3.4~~ 3.4 ppm and 2.0 ppm, respectively. The monitoring station at Queens College 2 is the closest monitoring station to the proposed project sites that has available recorded data over a recent 5-year period. The background concentrations used are consistent with the background concentrations provided in the CEQR Technical Manual.

The PM₁₀ 24-hour background concentration of 50 µg/m³ was based on the maximum second-highest concentration, measured over the most recent three-year period at the Queens College 2 monitoring station. PM_{2.5} impacts are assessed on an incremental basis and compared with the PM_{2.5} ~~interim guidance~~ de minimis criteria. ~~Therefore, a PM_{2.5} 24-hour average background concentration of 26 µg/m³ (based on the 2009 to 2011 average of 98th percentile concentrations) was used to establish the de minimis value, consistent with the background concentration provided for Queens in the CEQR Technical Manual. for PM_{2.5} is not included.~~

MOBILE SOURCE ANALYSIS SITES

Two signalized intersection locations (Site 1 and Site 2, shown in **Figure 15-1**) were selected for the microscale CO and PM analysis, for Phase 1A and Phase 2, as shown in **Table 15-2**. These intersections were selected after considering all intersection locations analyzed for the traffic study (see Chapter 14, "Transportation") because they are among the signalized locations where the greatest number of vehicles generated by the proposed project and, therefore, the maximum changes in the concentrations and greatest potential for air quality impacts are expected. Existing traffic volumes, existing and future predicted levels of service, and proximity of the intersections

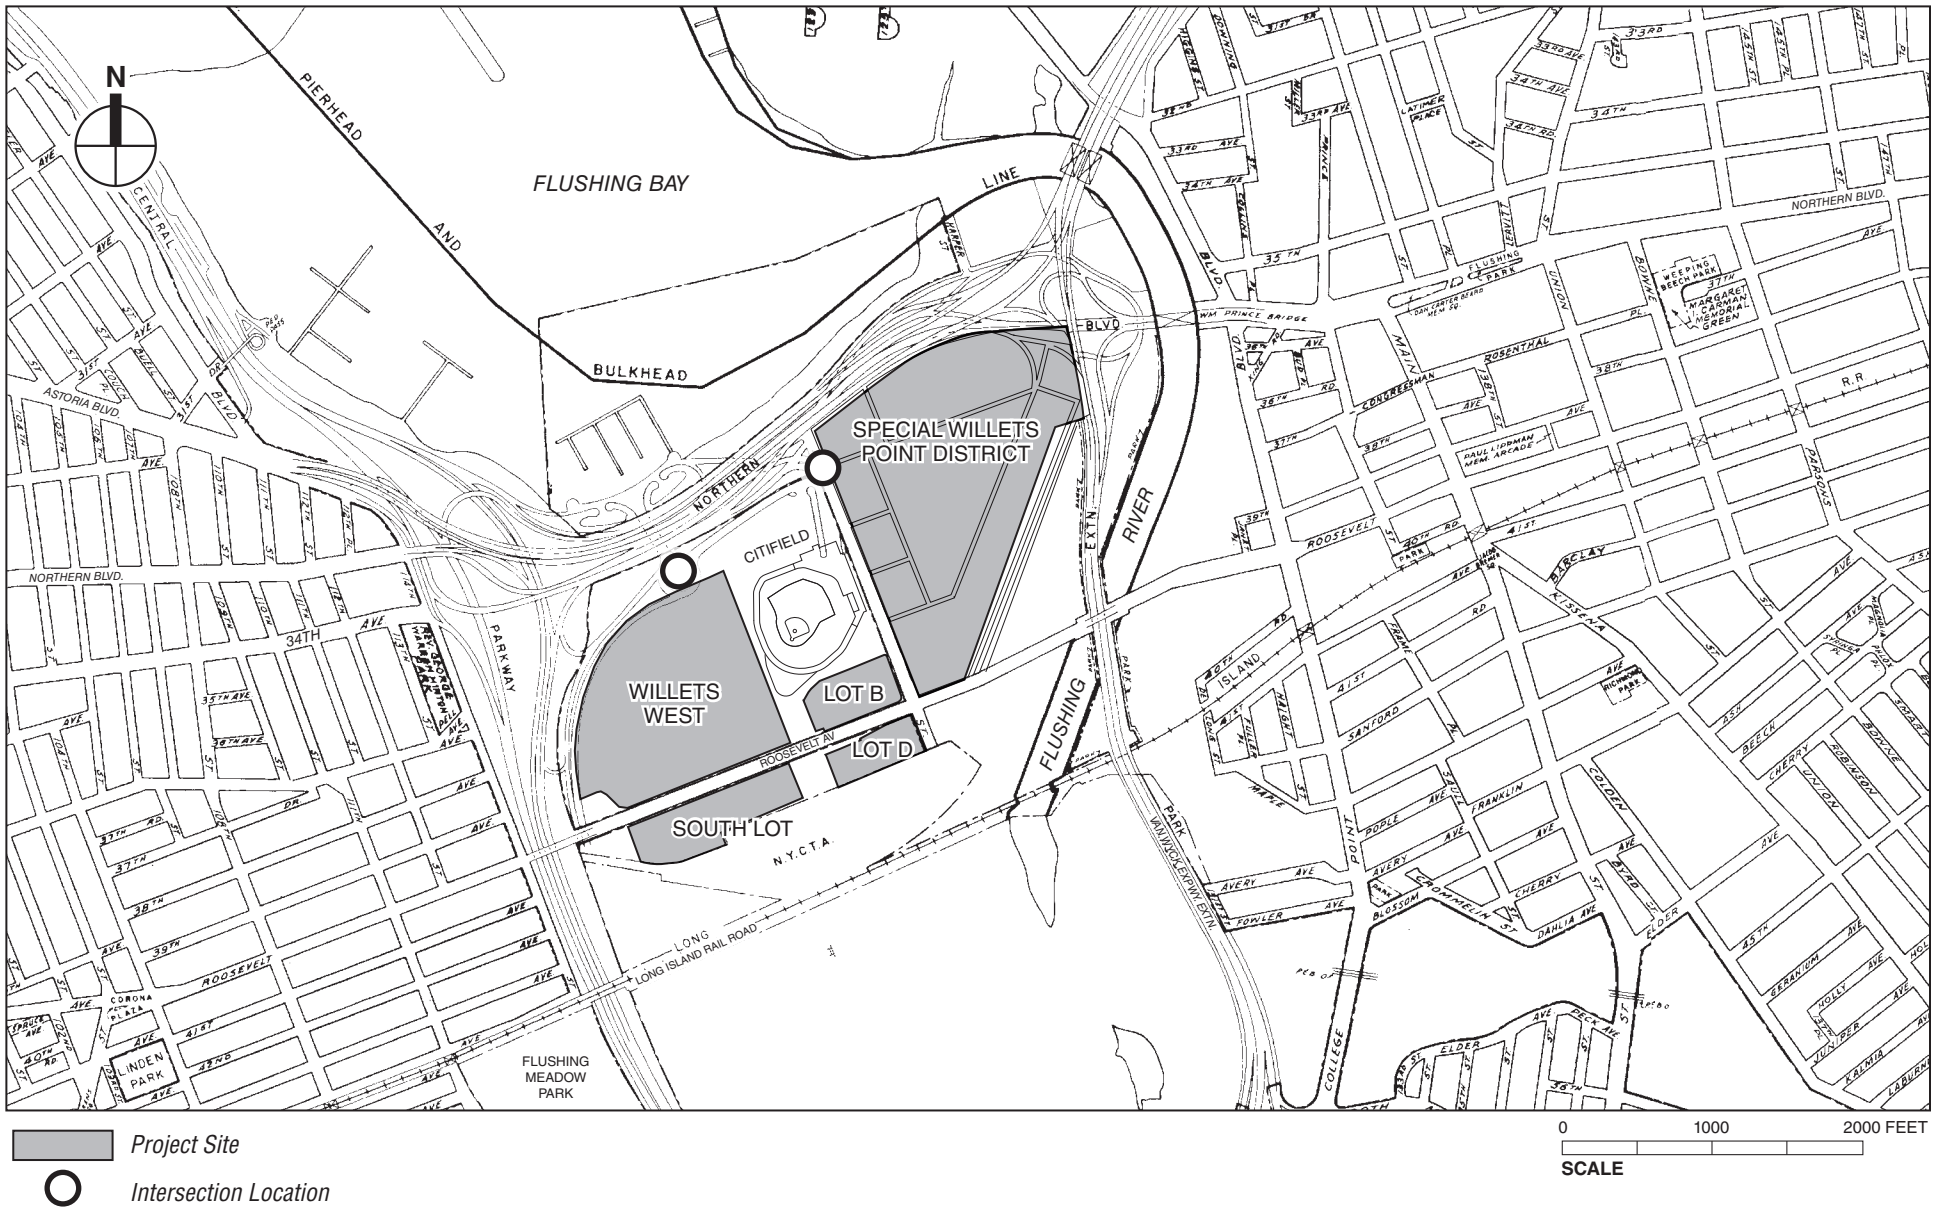

Table 15-2
Mobile Source Analysis Intersection Locations

Analysis Site	Location	Phase	Pollutant
1	34th Avenue and 126th Street	2	CO, PM ₁₀ , PM _{2.5}
2	Boat Basin Road and Shea Road	1A	CO, PM ₁₀ , PM _{2.5}
		2	CO

to pedestrian uses were also considered in the selection of intersections for the air quality analysis. Site 1 was also the location where the highest concentration of CO was predicted as part of the analysis conducted for the 2008 FGEIS. PM impacts were analyzed at Site 1 for Phase 2, as Site 1 would have the greatest number of projected emissions from truck and overall vehicle trips in Phase 2. A more refined analysis of the effect of PM emissions at Site 1 with Phase 2 was performed since the completion of the DSEIS. PM impacts were also analyzed at Site 2 for Phase 1A to assess the effect on PM concentrations from Willets West and development within the District prior to the construction of Van Wyck ramps.

RECEPTOR LOCATIONS

Multiple receptors (i.e., precise locations at which concentrations are predicted) were modeled at each of the selected sites. Receptors were placed along the approach and departure links at spaced intervals. Local model receptors were placed at sidewalk or roadside locations near intersections with continuous public access. Receptors in the annual PM_{2.5} neighborhood scale models were placed at a distance of 15 meters from the nearest moving lane, based on the DEP recommended procedure for neighborhood scale corridor PM_{2.5} modeling.

REFINED MOBILE SOURCE ANALYSIS

As discussed in the DSEIS, the PM_{2.5} emission factors calculated by the MOVES model vary by speed, with higher levels of engine emissions at low travel speeds. As the MOVES model was primarily created and to date used for modeling inventories, there is limited guidance on the use of the model for project-level microscale analysis in urban areas. Refinements that could provide more accurate estimates of emissions on an hour-by-hour basis using project-specific traffic data were mentioned in the DSEIS. Refinements were performed for Site 1, for non-game conditions with Phase 2, to supplement the particulate matter results presented in the DSEIS, which were based on more conservative assumptions. The refinements included use of detailed hourly trip projections and trip assignments which were provided by the Corridor Simulation (CORSIM) traffic simulation model.

CORSIM simulates the movements of vehicles, accounting for the influences of road geometry, traffic control conditions, and driver behavior. Hourly speeds and processed vehicle volumes were produced by CORSIM for a 13-hour period, covering AM, midday, and PM conditions. The speeds and volumes for each hour during the 13-hour period were used to obtain emission rates from the MOVES model and concentrations using CAL3QHCR.

In addition, following USEPA guidance¹, the queuing algorithm in CAL3QHCR was not used with the refined analysis of PM impacts. Accordingly, the hourly speeds developed using traffic

¹ USEPA, Transportation Conformity Guidance for Quantitative Hot-spot Analyses in PM_{2.5} and PM₁₀ Nonattainment and Maintenance Areas, December 2010.

simulation modeling include idling time, and emissions calculated using the MOVES model account for idling emissions, as recommended by USEPA.

PARKING FACILITIES

The proposed project would include parking facilities to provide for new parking demand and replace the CitiField parking that would be displaced from construction of the Willets West portion of the project in Phase 1A. Emissions from vehicles using the parking areas could potentially affect ambient levels of CO.

The proposed parking facility at Willets West was selected for analysis as it is the largest parking facility proposed for development outside of the Special Willets Point District, and would be constructed in the first phase of development (Phase 1A), when the emissions on a per vehicle basis would be highest.

The garage associated with the proposed convention center was analyzed since the convention center would generate the greatest potential parking demand within the District and would result in the highest concentrations of pollutants at nearby receptors. The analysis year for the convention center garage was 2032, as the convention center would be constructed in Phase 2, when the on-street traffic volumes would be greatest.

The analysis of emissions from the proposed parking facilities' outlet vents and their dispersion was performed using the methodology set forth in the *CEQR Technical Manual*. Emissions from vehicles entering, parking, and exiting the parking structures were estimated using the USEPA MOVES mobile source emission model. For all arriving and departing vehicles, an average speed of 5 miles per hour was conservatively assumed for travel within the parking structure. In addition, all departing vehicles were assumed to idle for 1 minute before proceeding to the exit. The concentration of CO within the parking structure was calculated assuming a minimum ventilation rate, based on New York City Building Code requirements, of 1 cubic foot per minute of fresh air per gross square foot of garage area.

To determine pollutant levels in the vicinity of the vents, the exhaust from the parking garages was analyzed as a "virtual point source" using the methodology in USEPA's *Workbook of Atmospheric Dispersion Estimates*, AP-26. This methodology estimates CO concentrations at various distances from the vents by assuming that the concentration in the garage is equal to the concentration leaving the exhaust, and determining the appropriate initial horizontal and vertical dispersion coefficients at the vent faces. Background and on-street CO concentrations were then added to the modeling results to obtain the total ambient levels at each receptor location. The on-street CO concentration was determined using the methodology in Air Quality Appendix 1 of the *CEQR Technical Manual*, utilizing traffic volumes on 34th Avenue approaching 126th Street (mobile source analysis Site 1).

Since there are no specific garage designs for the proposed project, reasonable worst-case assumptions for air quality modeling were made regarding the design of the garages mechanical ventilation systems. The exhaust from each parking garage was assumed to be vented through a single outlet vent with a height of 10 feet. The vent was assumed to exhaust directly onto the street, and a "near" receptor was placed along the sidewalks at a pedestrian height of six feet and at a distance of five feet from the vent. A "far" receptor was placed directly across the street from the assumed vent location, at a distance of 60 feet for the Willets West parking facility and 84 feet for the convention center. The vent at the convention center was also analyzed assuming a sensitive receptor on the building façade located at a height of six feet above the vent. A persistence factor of 0.7 was used to convert the calculated 1-hour average maximum

concentrations to 8-hour averages, accounting for meteorological variability over the average 8-hour period.

STATIONARY SOURCES

HEATING AND HOT WATER SYSTEMS

The only fossil fuel that would be used for heating and hot water systems for the proposed development would be natural gas. For the District, the requirement to use natural gas, if using a fossil fuel, would be implemented through the E-designations that are already in place; the requirements set forth in this SEIS would supersede the requirements previously set forth for the E-designations. For Willets West, the requirement would be incorporated into the development agreements and/or amended leases.

Per the guidance presented in the *CEQR Technical Manual* for natural gas burning sources, NO₂ was the only pollutant considered in the dispersion analysis. Future concentrations of 1-hour average and annual average NO₂ resulting from the proposed heating and hot water system emissions were predicted using the USEPA/AMS AERMOD dispersion model.¹

Dispersion Modeling

AERMOD is a state-of-the-art dispersion model, applicable to rural and urban areas, flat and complex terrain, surface and elevated releases, and multiple sources (including point, area, and volume sources). AERMOD is a steady-state plume model that incorporates current concepts about flow and dispersion in complex terrain, including updated treatment of the boundary layer theory, understanding of turbulence and dispersion, and includes handling of the interaction between the plume and terrain.

The AERMOD model calculates pollutant concentrations from one or more points (e.g., exhaust stacks) based on hourly meteorological data, and has the capability to calculate pollutant concentrations at locations where the plume from the exhaust stack is affected by the aerodynamic wakes and eddies (downwash) produced by nearby structures. The analyses of potential impacts from the exhaust stacks were made assuming stack tip downwash, urban dispersion and surface roughness length, with and without building downwash (as recommended in the *CEQR Technical Manual*), and elimination of calms.

The AERMOD model also incorporates the algorithms from the PRIME model, which is designed to predict impacts in the “cavity region” (i.e., the area around a structure which under certain conditions may affect an exhaust plume, causing a portion of the plume to become entrained in a recirculation region). The Building Profile Input Program (BPIP) program for the PRIME model (BPIPRM) was used to determine the projected building dimensions for modeling with the building downwash algorithm enabled. The modeling of plume downwash accounts for all obstructions within a radius equal to five obstruction heights of the stack.

The analysis was performed both with and without downwash in order to assess the worst-case impacts at elevated receptors close to the height of the sources, which would occur without downwash, as well as the worst-case impacts at lower elevations and ground level, which would occur with downwash.

¹ EPA, AERMOD: Description Of Model Formulation, 454/R-03-004, September 2004; and EPA, User's Guide for the AMS/EPA Regulatory Model AERMOD, 454/B-03-001, September 2004 and Addendum December 2006.

For the analysis of the proposed project's effect on 1-hour average NO₂ concentrations, the Plume Volume Molar Ratio Method (PVMRM) module was applied within AERMOD, following USEPA's modeling guidance.¹ PVMRM analyzes chemical transformation of NO emitted from the stack to NO₂. The PVMRM module incorporates hourly background ozone concentrations to estimate NO_x transformation within the source plume. Ozone concentrations were obtained from the NYSDEC Queens College monitoring station, which is the station with recent ozone data nearest to the proposed project sites. An initial NO₂ to NO_x ratio of 10 percent at the source exhaust was assumed for the heating and hot water systems for the proposed buildings. This ratio is appropriate for boilers.²

Meteorological Data

The meteorological data set consisted of five consecutive years of meteorological data: surface data collected at LaGuardia Airport (2007–2011) and concurrent upper air data collected at Brookhaven, New York. The meteorological data provide hour-by-hour wind speeds and directions, stability states, and temperature inversion elevation over the five-year period. These data were processed using the USEPA AERMET program to develop data in a format that can be readily processed by the AERMOD model. The land uses around the site where meteorological surface data were available were classified using categories defined in digital United States Geological Survey (USGS) maps to determine surface parameters used by the AERMET program.

Background Concentrations

To estimate the maximum expected pollutant concentration at a given location (receptor), the predicted impacts must be added to a background value that accounts for existing pollutant concentrations from other sources that are not directly accounted for in the model. To develop background levels, concentrations measured over the latest available 5-year period (2007–2011) at Queens College 2, the nearest NYSDEC ambient monitoring station to the proposed project, were used to determine the annual average NO₂ concentration of 43 µg/m³. The annual background concentration was developed in accordance with the *CEQR Technical Manual* methodology.

Total 1-hour NO₂ concentrations were determined following methodologies that are accepted by the USEPA, and which are considered appropriate and conservative for this review. The methodology used to determine the compliance of total 1-hour NO₂ concentrations from the proposed sources with the 1-hour NO₂ NAAQS³ was based on adding the monitored background to modeled concentrations, as follows: hourly modeled concentrations from proposed sources were first added to the seasonal hourly background monitored concentrations; then the highest combined daily 1-hour NO₂ concentration was determined at each receptor location and the 98th percentile daily 1-hour maximum concentration for each modeled year was calculated within the AERMOD model; finally the 98th percentile concentrations were averaged over the latest five

years. These methodologies are recognized by USEPA and the City and are referenced in USEPA modeling guidance.

Receptor Placement

Discrete receptors (i.e., locations at which concentrations are calculated) were modeled along the facades of buildings nearby each source to represent operable window locations, intake vents, and otherwise accessible locations such as terraces, as well as open spaces, and the CitiField stadium. Rows of receptors were placed in the model at spaced intervals along the proposed building façades, at multiple elevations. Ground level Cartesian grid receptors were also modeled.

Emission Estimates and Stack Parameters

A site-specific heat and hot water system design is not yet available. For heating and hot water, the proposed development may use renewable energy (such as solar) or energy produced offsite (such as electricity or steam from a cogeneration plant, if proposed in the future), as well as natural gas. Other fossil fuels would not be permitted for use in heating and hot water systems. Therefore, the use of natural gas was assumed as the reasonable worst case. The annual average emission rates for the heating and hot water systems operating on natural gas, were developed using the proposed development size (square feet) by use, annual energy intensity data from the Air Quality Appendix of the *CEQR Technical Manual*, and USEPA's *Compilations of Air Pollutant Emission Factors (AP-42)*¹ emission factors (except for emission factors associated with the use of low-NO_x [<30 ppm] burners where required). The 1-hour average emission rate was calculated from the annual emission rate by assuming 100 heating days. The heat and hot water system stacks for the proposed buildings were assumed to be located at the top building tier. This stack placement, needed to avoid the potential for significant adverse impacts on air quality, would be required for the proposed development within the District and Willets West. For the District, the requirement would be implemented through E-designations that are already in place; these requirements would supersede the requirements previously set forth for the E-designations. For Willets West, the requirement would be incorporated into the development agreements and/or amended leases. As discussed in more detail in Section H, "Probable Impacts of the Proposed Project," the requirements regarding the type of fuel use, stack placement, and low-NO_x burners could be amended in the future, as more information becomes available, if it could be demonstrated that there would be no potential for adverse impacts on air quality.

Typical stack parameters for exhaust velocity, diameter, and temperature were determined based on expected heat and hot water system calculated fuel usage rates. Emission rates and stack parameters are provided in **Table 15-3**.

INDUSTRIAL SOURCE ANALYSIS

The industrial source analysis presented in the Air Quality chapter of the 2008 FGEIS did not consider uses within the District because at the time it was assumed that the entire District would be redeveloped in one phase, requiring the existing on-site businesses to relocate before any of the proposed uses became occupied. The Staged Acquisition Alternative, considered in the 2008

Notes:

Parcels A1 through A19 are developments proposed within the Special Willeys Point District.

The uses modeled as residential include residential and hotel uses. The uses modeled as commercial include retail, office, community facility, school, and convention center.

Parcel A16 is not included as it would be developed with open space.

The exhaust temperature modeled for all proposed sites is 300 °F.

Natural gas and low-NO_x burners would be used on all of the proposed development sites.

FGEIS, and the Updated Plan, analyzed in Technical Memorandum #4, considered development in phases and assessed the potential for emissions from existing uses in the District to affect development within 400 feet that was proposed to be built early on. However, the boundaries of the early and later phases of development currently proposed are different from those analyzed previously. Therefore, the analysis was conducted to account for the changes to the boundary of the phasing, as well as any potential changes in the operations and emissions from the existing business.

In addition, a NYSDEC permit search and a search of USEPA's Envirofacts database¹ was performed to obtain information about manufacturing or industrial emissions for larger sources, such as asphalt plants, within 1,000 feet of the proposed project. No new or substantially changed sources of emissions were identified, and no additional analysis was warranted.

Information regarding the release of air contaminants from permitted facilities within and beyond the study area was obtained from DEP's Bureau of Environmental Compliance (BEC). The only uses with a potential to affect the proposed project were identified to be existing uses in the area proposed for development in Phase 2, within 400 feet of the District area proposed for development in Phase 1A and Phase 1B.

¹ http://oaspub.epa.gov/enviro/ef_home2.air

After compiling the information on facilities with manufacturing or process operations in the study area, maximum potential pollutant concentrations from different sources, at various distances from the site, are estimated based on the screening database in the *CEQR Technical Manual*. The database provides factors for estimating maximum concentrations based on emission levels at the source, which were derived from generic AERMOD dispersion modeling for the New York City area. Impact distances selected for each source are the minimum distances between the Phase 1A/Phase 1B boundary and the source site. Predicted worst-case impacts on the proposed project were compared with the short-term guideline concentrations (SGCs) and annual guideline concentrations (AGCs) in NYSDEC's DAR-1 AGC/SGC tables. These guidelines represent levels that are considered safe for inhalation exposure by the public. Predicted concentrations below an SGC or AGC indicate that there is no potential for significant adverse impacts on air quality. Industrial source emissions of criteria pollutants are also considered and the potential for impact is assessed by comparing the predicted pollutant levels to NAAQS.

F. EXISTING CONDITIONS

Representative criteria pollutant concentrations measured in recent years at NYSDEC air quality monitoring stations nearest to the proposed project site are presented in **Table 15-4**. The values presented are consistent with the NAAQS format. For example, the 8-hour ozone concentration shown is the 3-year average of the 4th highest daily maximum 8-hour average concentrations. The concentrations were obtained from the 2011 New York State Ambient Air Quality Report, the most recent report available. The recently monitored levels did not exceed the NAAQS. It should be noted that these values are somewhat different from the background concentrations used in the stationary source and parking facility analyses. The concentrations presented in **Table 15-4** provide a comparison of the air quality in the project area with the NAAQS, while background concentrations are obtained from several years of monitoring data, and represent a conservative estimate of the highest concentrations for future ambient conditions.

Table 15-4
Representative Monitored Ambient Air Quality Data

Pollutant	Location	Units	Averaging Period	Concentration	NAAQS
CO	Queens College 2, Queens	ppm	8-hour	1.4	9
			1-hour	1.9	35
SO ₂	Queens College 2, Queens ¹	µg/m ³	3-hour	78	1,300
			1-hour	79	196
PM ₁₀	Queens College 2, Queens	µg/m ³	24-hour	40	150
PM _{2.5}	P.S. 219, Queens	µg/m ³	Annual	9.9	15 ³
			24-hour	26	35

			1-hour	126	188
Lead	J.H.S. 126, Brooklyn	µg/m ³	3-month	0.012	0.15
Ozone	Queens College 2, Queens	ppm	8-hour	0.075	0.075
Notes: ⁽¹⁾ The 1-hour value is based on a three-year average (2009-2011) of the 99th percentile of daily maximum 1-hour average concentrations. USEPA replaced the 24-hr and the annual standards with the 1-hour standard. ⁽²⁾ The 1-hour value is based on a three-year average (2009-2011) of the 98th percentile of daily maximum 1-hour average concentrations. ⁽³⁾ The NAAQS shown was that in effect at the time when the monitored data were collected. USEPA has lowered the primary standard to 12 µg/m ³ , effective March 2013. Source: NYSDEC, New York State Ambient Air Quality Report (2011).					

G. THE FUTURE WITHOUT THE PROPOSED PROJECT

MOBILE SOURCES

CARBON MONOXIDE

CO concentrations without the proposed project (No Action) were determined for the 2018 analysis year for Phase 1A, as well as for the 2032 analysis year for Phase 2, using the methodology previously described. **Table 15-5** shows future maximum predicted 8-hour average CO concentrations at the analyzed intersections in 2018 without the proposed project during the peak period when those concentrations were predicted to be greatest. The values shown are the highest predicted concentrations for the receptor locations for both of the time periods analyzed.

Table 15-5
Phase 1A (2018)
8-Hour Average CO Concentrations
Without the Proposed Project

Analysis Site	Location	Time Period	8-Hour Concentration (ppm)
2	Boat Basin Road and Shea Road	Weekend non-game day	2.1
2	Boat Basin Road and Shea Road	Weekend game day	2.3
Note: 8-hour standard (NAAQS) is 9 ppm.			

As shown in **Table 15-5** and **Table 15-6**, the CO concentrations without the proposed project are predicted to be well below the 8-hour CO standard of 9 ppm, in both the Phase 1A and Phase 2 analysis years.

Table 15-6
Phase 2 (2032)
8-Hour Average CO Concentrations
Without the Proposed Project

Analysis Site	Location	Time Period	8-Hour Concentration (ppm)
1	34th Avenue and 126th Street	Weekend non-game day	2.1
1	34th Avenue and 126th Street	Weekend game day	2.2
Note: 8-hour standard (NAAQS) is 9 ppm.			

PARTICULATE MATTER

PM concentrations without the proposed project were determined for 2018, the analysis year for Phase 1A, and for 2032, the analysis year for Phase 2 using the methodology previously described. **Table 15-7** and **Table 15-8** present the future maximum predicted 24-hour concentrations at the analyzed intersections for the Phase 1A analysis year (2018) and Phase 2

Table 15-7
Phase 1A (2018)
24-Hour PM₁₀ Concentrations Without the Proposed Project

Analysis Site	Location	Time Period	Concentration (µg/m ³)
2	Boat Basin Road and Shea Road	Weekend non-game day	57.8
2	Boat Basin Road and Shea Road	Weekend game day	65.9
Note: NAAQS—24-hour average 150 µg/m ³ . The annual average standard was revoked in 2006.			

Table 15-8
Phase 2 (2032)
24-Hour PM₁₀ Concentrations Without the Proposed Project

Analysis Site	Location	Time Period	Concentration (µg/m ³)
1	34th Avenue and 126th Street	Weekend non-game day	62.2
1	34th Avenue and 126th Street	Weekend game day	69.3
Note: NAAQS—24-hour average 150 µg/m ³ . The annual average standard was revoked in 2006.			

analysis year (2032), respectively without the proposed project (No Action). The values shown are the highest predicted concentrations for the receptor locations. As shown in the tables, the 24-hour PM₁₀ concentrations would be below the NAAQS without the proposed project in both the Phase 1A and Phase 2 analysis years.

STATIONARY SOURCES

Without the proposed project, there would likely much less or possibly no development at the proposed sites. Stationary source emissions from existing sources would decrease with the phased implementation of State and local laws to restrict the use of Nos. 6 and 4 fuel oil for heating, and lower the sulfur content of No. 2 fuel oil. With or without the proposed project, vehicle technology would continue to improve, and emission standards for new vehicles would become more stringent. With the improvements in technology and the implementation of New York State and New York City regulations that would require the use of cleaner fuels for heat and hot water, an overall improvement in air quality is anticipated. The auto and manufacturing businesses and associated emissions from those uses within the District would likely remain, as would the contamination in the District.

H. PROBABLE IMPACTS OF THE PROPOSED PROJECT

As discussed, the proposed project would result in increased mobile source emissions in the vicinity of the project sites, emissions at the proposed parking facilities, as well as emissions from fuel combustion in heating and hot water systems. In Phase 1A and Phase 1B, the proposed project would also result in the development of recreational, residential, community facility, and other sensitive uses within 400 feet of existing stationary source noncriteria pollutant emissions sources (auto and manufacturing businesses). The following sections describe the results of the studies performed to analyze the potential air quality impacts from these sources.

MOBILE SOURCES ANALYSIS

PHASE 1A (2018)

Carbon Monoxide

Using the methodology previously described, CO concentrations with the proposed project (With Action) and without the proposed project (No Action) were determined for Phase 1A in 2018, at the signalized traffic intersection that would have the greatest potential for significant adverse impact on air quality. **Table 15-9** shows the future maximum predicted 8-hour average CO concentration with and without the proposed project at the intersection analyzed. (No 1-hour values are shown, since no exceedances of the NAAQS would occur and the *de minimis* criteria are only applicable to 8-hour concentrations; therefore, the 8-hour values are the most critical for impact assessment.) The values shown represent the highest predicted concentrations for any of the receptors analyzed for the peak periods for which the greatest concentrations and/or concentration increments were predicted. The results indicate that the proposed project would not result in any violations of the 8-hour CO standard. In addition, the incremental increases in 8-hour average CO concentrations are very small, and consequently would not result in a violation of the CEQR *de minimis* CO criteria. (The *de minimis* criteria are described above in Section D: “Air Quality Regulations, Standards, and Benchmarks.”)

Table 15-9
Phase 1A (2018) 8-Hour Average CO Concentrations

Analysis Site	Location	Time Period	8-Hour Concentration (ppm)			
			No Action	With Action	Increment	De Minimis
2	Boat Basin Road and Shea Road	Weekend non-game day	2.1	2.3	0.2	3.5
2	Boat Basin Road and Shea Road	Weekend game day	2.3	2.4	0.1	3.4
Notes: 8-hour standard (NAAQS) is 9 ppm.						

PARTICULATE MATTER

PM concentrations with the proposed project (With Action) were determined for the 2018 Phase 1A analysis year using the methodology previously described. **Table 15-10** shows the 2018 maximum predicted 24-hour average PM₁₀ concentrations without and with the proposed project (No Action and With Action).

Table 15-10
Phase 1A (2018) 24-Hour Average PM₁₀ Concentrations

Analysis Site	Location	Time Period	24-Hour Concentration (µg/m ³) ¹	
			No Action	With Action
2	Boat Basin Road and Shea Road	Weekend non-game day	57.8	65.2
2	Boat Basin Road and Shea Road	Weekend game day	65.9	66.4
Note: ¹ NAAQS—24-hour average 150 µg/m ³ .				

The values shown are the highest predicted concentrations for any of the receptors analyzed. The results indicate that the proposed project in Phase 1A would not result in any violations of the PM₁₀ standard at any of the receptor locations analyzed.

Future maximum predicted 24-hour and annual average PM_{2.5} concentrations were determined so that they could be compared with the interim guidance criteria for PM_{2.5}. Consistent with current CEQR guidance, PM_{2.5} concentrations are presented as an incremental change in concentrations with and without the proposed project (With Action and No Action). The maximum predicted localized 24-hour average and neighborhood-scale annual average PM_{2.5} concentration increments are presented in **Tables 15-11** and **15-12**, respectively. The results show that the daily (24-hour) PM_{2.5} and annual increments are predicted to be well below the ~~interim guidance~~ *de minimis* criteria and, therefore, the proposed project would not result in significant PM_{2.5} impacts at the analyzed receptor locations.

Table 15-11

Phase 1A (2018) 24-Hour Average PM_{2.5} Concentration Increments in µg/m³

Analysis Site	Location	Time Period	Increment	<i>De Minimis</i>
2	Boat Basin Road and Shea Road	Weekend non-game day	2.31	<u>4.5</u>
2	Boat Basin Road and Shea Road	Weekend game day	0.93	<u>4.5</u>
Note: <u>The PM_{2.5} <i>de minimis</i> criteria superseded the PM_{2.5} interim guidance criteria on June 5, 2013. The 24-hour average interim guidance criteria for PM_{2.5} were as follows—24-hour average, > 2 µg/m³ (5 µg/m³ not-to-exceed value), based on the magnitude, frequency duration, location, and size of the area of the predicted concentrations. The PM_{2.5} increments shown are less than the <i>de minimis</i> value. These increments were not considered significant when they were compared with the interim guidance criteria in the DSEIS, and are also not significant when compared to the <i>de minimis</i> value.</u>				

Table 15-12

Phase 1A (2018) Neighborhood Scale PM_{2.5} Concentration Increments in µg/m³

Analysis Site	Location	Increment
2	Boat Basin Road and Shea Road	0.03
Note: <u>PM_{2.5} interim guidance <i>de minimis</i> criteria—annual average (neighborhood scale) greater than 0.1 µg/m³. The <i>de minimis</i> criteria superseded the interim guidance criteria that were used for impact assessment in the DSEIS. For annual increments, the <i>de minimis</i> criteria are the same as the superseded interim guidance criteria.</u>		

The maximum 24-hour average incremental PM_{2.5} concentration from mobile source analysis was predicted to be 2.31 µg/m³ (shown in **Table 15-11**) at Site 2, for Phase 1A, for the non-game analysis period. On game days, the 24-hour average incremental PM_{2.5} was predicted to be below 2.0 0.93 µg/m³. These concentration increments would be less than the *de minimis* criterion of 4.5 µg/m³. Throughout the five analysis years, 24-hour average PM_{2.5} concentration increments above 2.0 µg/m³ were predicted to occur only once. Based on the magnitude, extent, and frequency of 24-hour average PM_{2.5} concentrations above 2.0 µg/m³, the proposed project would not result in significant PM_{2.5} impacts at the analyzed receptor location. Furthermore, the maximum predicted 24-hour average concentration is 5.18 µg/m³, which when added to the PM_{2.5} background concentration of 26 µg/m³ would be less than the corresponding NAAQS of 35 µg/m³.

Willets Point Development

Therefore, the predicted PM_{2.5} increments from mobile sources associated with Phase 1A of the proposed project would not result in a significant adverse air quality impact.

PHASE 2 (2032)

CO concentrations with the proposed project were determined for Phase 2, in the 2032 analysis year, at the traffic intersection selected using the methodology previously described. **Table 15-13** shows the future maximum predicted 8-hour average CO concentration with and without the proposed project (With Action and No Action) at the intersection studied. (No 1-hour values are shown, since no exceedances of the NAAQS would occur and the *de minimis* criteria are only applicable to 8-hour concentrations; therefore, the 8-hour values are the most critical for impact assessment.) The values shown represent the highest predicted concentrations for any of the receptors analyzed for the peak periods for which the greatest concentrations and/or concentration increments were predicted. The results indicate that the proposed project would not result in any violations of the 8-hour CO standard. In addition, the incremental increases in 8-hour average CO concentrations are very small, and consequently would not result in a violation of the CEQR *de minimis* CO criteria. (The *de minimis* criteria are described above in Section D: “Air Quality Regulations, Standards, and Benchmarks.”)

Table 15-13
Phase 2 (2032)

8-Hour Average CO Concentrations

Analysis Site	Location	Time Period	8-Hour Concentration (ppm)			
			No Action	With Action	Increment	<i>De Minimis</i>
1	34th Avenue and 126th Street	Weekend non-game day	2.1	2.6	0.5	3.5
1	34th Avenue and 126th Street	Weekend game day	2.2	2.6	0.4	3.4
Note: 8-hour standard (NAAQS) is 9 ppm.						

PARTICULATE MATTER

PM concentrations with the proposed project (With Action) were determined for Phase 2, in the 2032 analysis year. The non-game day PM_{2.5} concentration increments were determined using the refined methodology—previously described. **Table 15-14** shows the future maximum predicted 24-hour average PM₁₀ concentrations without and with the proposed project (No Action and With Action).

Table 15-14
Phase 2 (2032)

24-Hour Average PM₁₀ Concentrations

Analysis Site	Location	Time Period	24-Hour Concentration (µg/m ³) ¹	
			No Action	With Action
1	34th Avenue and 126th Street	Weekend non-game day	62.2	70.6
1	34th Avenue and 126th Street	Weekend game day	69.3	70.1
Note: ¹ NAAQS—24-hour average 150 µg/m ³ .				

The values shown are the highest predicted concentrations for any of the receptors analyzed. The results indicate that the proposed project would not result in any violations of the PM₁₀ standard at any of the receptor locations analyzed.

Future maximum predicted 24-hour and annual average PM_{2.5} concentrations were determined so that they could be compared with the ~~interim guidance~~ *de minimis* criteria for PM_{2.5}. Consistent with current CEQR guidance, PM_{2.5} concentrations are presented as an incremental change in concentrations with and without the proposed project. The maximum predicted localized 24-hour average and neighborhood-scale annual average PM_{2.5} concentration increments are presented in **Tables 15-15** and **15-16**, respectively. The results show that the ~~maximum daily (24-hour) PM_{2.5} increments are predicted to be below~~ would not exceed the applicable *de minimis* criteria, ~~interim guidance criterion of 5 µg/m³, and the maximum annual average PM_{2.5} increments are not predicted to exceed the applicable interim guidance criterion of 0.1 µg/m³.~~

Table 15-15
Phase 2 (2032)

24-Hour Average PM_{2.5} Concentration Increments in µg/m³

Analysis Site	Location	Time Period	Increment	<i>De Minimis</i>
1	34th Avenue and 126th Street	Weekend non-game day	3.50 <u>1.28</u>	<u>4.5</u>
1	34th Avenue and 126th Street	Weekend game day	1.70	<u>4.5</u>

Note:
The CEQR PM_{2.5} *de minimis* criteria superseded the PM_{2.5} interim guidance criteria on June 5, 2013. The 24-hour average interim guidance criteria for PM_{2.5} were as follows —24-hour average, > 2 µg/m³ (5 µg/m³ not-to-exceed value), based on the magnitude, frequency duration, location, and size of the area of the predicted concentrations. The PM_{2.5} increments shown are less than the *de minimis* value. These increments were not considered significant when they were compared with the interim guidance criteria in the DSEIS, and are also not significant when compared to the *de minimis* value.

Table 15-16
Phase 2 (2032)

Neighborhood Scale PM_{2.5} Concentration Increments in µg/m³

Analysis Site	Location	Increment
1	126th Street and Roosevelt Avenue	0.10 <u>0.08</u>

Note:
PM_{2.5} interim guidance *de minimis* criteria—annual average (neighborhood scale) greater than 0.1 µg/m³. The *de minimis* criteria superseded the interim guidance criteria that were used for impact assessment in the DSEIS. For annual increments, the *de minimis* criteria are the same as the superseded interim guidance criteria.

The maximum 24-hour average incremental PM_{2.5} concentration from mobile source analysis at Site 1 was predicted to be ~~3.50~~ 1.28 µg/m³ (shown in **Table 15-15**), in Phase 2, for the non-game analysis period, based on the refined modeling analysis. On game days, the 24-hour average incremental PM_{2.5} was predicted to be ~~below 2.0~~ 1.70 µg/m³. These increments would not exceed the *de minimis* criterion of 4.5 µg/m³. The maximum neighborhood scale annual increment of 0.08 µg/m³ would not exceed the *de minimis* criterion of 0.1 µg/m³.

Therefore, the predicted PM_{2.5} increments from mobile sources associated with Phase 2 of the proposed project would not result in a significant adverse air quality impact.

~~Assuming non game day conditions throughout the five analysis years, 24 hour average PM_{2.5} concentration increments above 2.0 µg/m³ were predicted to occur for at most 10 times in a year, and at an average of 7.4 times per year. Over the five year period, there were only three occurrences per year of concentration increments above 3.0 µg/m³, occurring at most once per year, and at an average of 0.6 times per year. The PM_{2.5} emission factors calculated by the MOVES model vary by speed, with higher levels of engine emissions at low travel speeds. As the MOVES model was primarily created and to date used for modeling inventories, there is limited guidance on the use of the model for project level microscale analysis in urban areas. There are a number of refinements that could provide more accurate estimations of emissions on an hour by hour basis using project specific traffic data instead of the more conservative assumptions used in the analysis. Additional air quality studies will be undertaken between the DSEIS and FSEIS to further refine the mobile source analysis for the Phase 2 analysis year, in consultation with DEP. A sensitivity analysis was performed to assess the potential reductions of predicted PM_{2.5} emissions that would likely occur as a result of the refinements that would be performed between DSEIS and FSEIS. Based on a potential reduction of 12 to 15 percent, developed using the sensitivity analysis, it is anticipated that the maximum frequency of PM_{2.5} concentrations above 2 µg/m³ would be reduced to at most 7 times in any year. In consideration of these factors including effects of vehicle idling and average vehicle speeds, the frequency of occurrence is not considered to be significant. Furthermore, the maximum predicted 24 hour average concentration is 6.73 µg/m³, which when added to the PM_{2.5} background concentration of 26 µg/m³ would be less than the corresponding NAAQS of 35 µg/m³.~~

PARKING FACILITIES

WILLETS WEST PARKING

Using the methodology set forth in the *CEQR Technical Manual*, the CO concentrations from the proposed Willets West parking facility were predicted. In 2018, the completion of Phase 1A, when Willets West would be constructed, the maximum CO concentrations from the parking facility, including ambient background levels and contributions from on-street traffic at sensitive receptors closest to the exhaust would be 8.4 ppm for the 1-hour period, and 5.1 ppm for the 8-hour period. These maximum predicted CO levels would be in compliance with the applicable CO federal ambient air quality standards. The maximum CO concentrations for the 1-hour and 8-hour averaging period for the Willets West parking without the background and on-street contributions (i.e., the concentration increments) would be 5.0 ppm and 3.1 ppm, respectively. The 8-hour average change in CO concentration of 3.1 ppm would be less than the *de minimis* value of 3.5 ppm¹. Since the proposed Willets West parking facility under the worst-case assumptions would not exceed the NAAQS or the *de minimis criteria*, and would therefore not result in significant air quality impacts, it is concluded that other parking facilities that would be constructed outside of the Special Willets Point District, with a smaller capacity, would also not result in significant air quality impacts.

CONVENTION CENTER PARKING

Using the methodology set forth in the *CEQR Technical Manual*, the CO concentrations from a parking garage at the proposed convention center were predicted. The maximum CO concentrations in 2032, the analysis year for Phase 2, in which the convention center would be

¹ The baseline concentration used to compute the *de minimis* value was assumed to be the background CO concentration.

built, including ambient background levels and contributions from on-street traffic at sensitive receptors closest to the exhaust would be 4.9 ppm for the 1-hour period, and 2.9 ppm for the 8-hour period. These maximum predicted CO levels would be in compliance with the applicable CO federal ambient air quality standards. The maximum CO concentrations for the 1-hour and 8-hour averaging period for the convention center parking garage without the background and on-street contributions would be 1.3 ppm and 0.7 ppm, respectively. The 8-hour average change in CO concentration of 0.7 ppm would be less than the *de minimis* value of 3.5 ppm. Since the proposed convention center garage under the worst-case assumptions would not exceed the NAAQS or the *de minimis criteria*, and would therefore not result in significant air quality impacts, it is concluded that other garages that would be constructed within the District, with a smaller capacity would also not result in significant air quality impacts.

STATIONARY SOURCES

HEATING AND HOT WATER SYSTEMS

As described previously, a refined dispersion modeling analysis of heating and hot water systems for the proposed project was performed using the available information regarding the proposed project buildings. It was determined that all proposed buildings would be restricted to using natural gas as the only fossil fuel for heating and hot water systems; fuel oil would be prohibited. To account for a range of possible development sizes and stack locations, very conservative assumptions were made regarding the gross square foot area that would be served by a single heating and hot water system exhaust and stack locations analyzed. Based on the results of the conservative heating and hot water systems refined modeling analysis, a number of measures would be needed to avoid the potential for significant adverse impact on air quality. For the District, these requirements would be implemented through the E-designations that are already in place; these requirements would supersede the requirements previously set forth for the E-designations. For Willets West, the requirements would be incorporated into the development agreements and/or amended leases. The requirements specified in the E-designations or development agreements and/or amended leases would be as follows:

1. Natural gas shall be the only fossil fuel used for heating and hot water equipment on all of the proposed project sites.
2. Any fossil-fuel fired heating and hot water system exhaust stack for the proposed development shall be located at the highest tier of the building that it would serve.
3. Any heating and hot water exhaust stack on Parcel A1 shall be at least 12 feet above the top habitable floor roof. Any fossil-fuel fired heating and hot water system stack exhaust height on Parcels A2, A3, A4, A8, A11, and Willets West shall be at least 10 feet above the top habitable floor roof.
4. Any new development must use low-NO_x (<30 ppm) burners.
5. In lieu of the requirements described above, an analysis may be performed to demonstrate that national and local ambient air quality standards and thresholds would be met using a different fuel type, stack location, stack height, and/or without low-NO_x burners. Such an analysis could consider information regarding emissions from the heating and hot water systems, emission controls, and projected heat and hot water demand specific to the proposed development. It is expected that such site specific information would become available as the mechanical design of the proposed sites progresses.

The cumulative heating and hot water analysis conducted considered the anticipated development on Lot B. The analysis showed that with the use of natural gas, low-NO_x burners and exhaust stack placement at the top building tier, there would be no potential for significant

adverse impact with the development on Lot B. As Lot B would require additional approvals that are not a part of the proposed project, any measures needed to preclude the potential for a significant adverse impact on air quality could be reevaluated and implemented in the future.

With the above requirements in place, the calculated concentrations for NO₂ are presented in **Table 15-17**, along with the relevant background concentrations, the total potential concentrations, and the applicable ambient standards. The annual average NO₂ impacts from the proposed development were conservatively calculated assuming that all of the NO emitted by the heat and hot water systems of the proposed development was fully transformed to NO₂ (100 percent conversion). The highest annual average concentration at any receptor over the 5-year modeling period is reported in **Table 15-17**. For the analysis of 1-hour impacts, the PVMRM module was applied and seasonal hourly background NO₂ data were added within the model. The highest combined daily 1-hour NO₂ concentration was determined at each receptor location for each day. The 8th highest (98th percentile) of the daily 1-hour maximum concentration for each modeled year was then calculated within the model. The 98th percentile concentrations were averaged over five years at each receptor, in accordance with USEPA guidance for addressing the NO₂ 1-hour standard and the maximum 5-year average value at any receptor is reported in **Table 15-17**.

Table 15-17
Potential Future NO₂ Concentrations
From the Heat and Hot Water Systems (µg/m³)

Pollutant	Averaging Period	Project Increment	Background Concentration	Total Concentration	NAAQS
NO ₂	Annual ¹	4.42	43	47	100
	1-hour ²	—	—	182.9	188
Notes: ¹ The annual modeled NO ₂ concentration was conservatively reported to be equal to the NO _x concentration. The increment presented is the highest concentration at any receptor over the five years modeled (2007–2011). ² The 1-Hour NO ₂ background concentration is not presented in the table since the AERMOD model determines the total 98th percentile 1-Hour NO ₂ concentration at each receptor. Total hourly NO ₂ concentrations throughout the modeling period were determined by adding the hourly modeled concentrations to the seasonal hourly ambient NO ₂ concentrations for each corresponding hour. The total 1-hour concentration reported is the five-year average of the annual 98th percentile of the highest combined daily 1-hour NO ₂ concentrations, in accordance with USEPA guidance.					

The maximum potential increase in concentrations associated with the proposed development's heat and hot water systems, when added to background concentrations, would be less than the NAAQS. Therefore, the proposed development's heat and hot water systems would not have the potential for significant adverse impacts on air quality.

With the implementation of the above discussed requirements, there would be no potential for significant adverse impacts on air quality from the proposed project.

INDUSTRIAL SOURCE ANALYSIS

A review of land uses and field survey information was conducted to identify auto, manufacturing and industrial uses within 400 feet of the proposed project, considering the existing uses within the District that would potentially remain until construction of the development proposed under Phase 2. Information was requested from DEP on permitted uses within and beyond the project study area. No existing uses of concern were identified outside of the District. Seven businesses having a DEP air emissions permit were identified within 400 feet

of the uses proposed for development in Phase 1A and Phase 1B. The emission rates specified in the permits and the minimum distance between each of the businesses and the proposed Phase 1A/Phase 1B development were used in the screening analysis.

Predicted worst-case short-term (1-hour average) and long-term (annual) levels of non-criteria pollutants resulting from existing uses that would potentially remain until construction of Phase 2 are shown in **Table 15-18**, along with the applicable guideline concentrations. The results of the screening analysis indicate that the non-criteria pollutant levels at the proposed development that would occur in Phase 1A and Phase 1B would be well below the NYSDEC guideline concentrations.

Table 15-18
Pollutant Concentration Resulting from Businesses with BEC Permits

Potential Contaminants	CAS No.	Estimated Emissions (g/s)	Predicted Short-term Concentrations ($\mu\text{g}/\text{m}^3$)	SGC ¹ ($\mu\text{g}/\text{m}^3$)	Predicted Long-term Concentrations ($\mu\text{g}/\text{m}^3$)	AGC ¹ ($\mu\text{g}/\text{m}^3$)
Butyl Acetate	00123-86-4	0.277	688	95,000	0.79	17,000
Toluene	00108-88-3	0.265	657	37,000	0.76	5,000
Solvents ²	NY998-00-0	0.926	23,288	98,000	148	7,000
Notes: 1) NYSDEC DAR-1 (Air Guide-1) AGC/SGC Tables (October 2010) AGC - Annual Guideline Concentrations SGC - Short-term Guideline Concentrations 2) As "Solvents" do not have an SGC or AGC listed in DAR-1 tables, the SGC and AGC for Isopropyl Alcohol (CAS# 00067-63-0), a common solvent, were used.						

PM₁₀ concentrations resulting from particulate emissions from the identified businesses were also analyzed, using the *CEQR Technical Manual* screening approach. The conservatively predicted maximum PM₁₀ 24-hour average concentration of 97 $\mu\text{g}/\text{m}^3$, when added to the monitored background of 50 $\mu\text{g}/\text{m}^3$ is 147 $\mu\text{g}/\text{m}^3$, which is below the 24-hour NAAQS of 150 $\mu\text{g}/\text{m}^3$. Accordingly, based on the data available on the existing auto, manufacturing, and industrial uses, there would be no potential for significant adverse air quality impacts on the proposed project.

Other Potential Sources

As discussed in the 2008 FGEIS, the Special District regulations allow the development of a wastewater reclamation facility, a cogeneration facility and an electrical utility substation within the District, provided they would primarily serve the District. Such facilities are not currently proposed as part of Phases 1A and 1B but may be included as part of Phase 2. Any such facilities, if proposed or needed at a future time, would require further study and additional approvals. If proposed as part of Phase 2, these uses would be subject to a separate environmental and public review process. The water reclamation facility would require approval by the Board of Standards and Appeals (BSA). The cogeneration facility would require approval by the BSA, as well as air permit approvals from DEP and NYSDEC. The substation would require authorization by the City Planning Commission (CPC). The Special District text requires that reviewing agencies prescribe appropriate conditions to minimize adverse effects on the character of the surrounding area, including emissions limits.

The wastewater reclamation facility and substation would likely have minimal air emissions and therefore would likely not result in any additional air quality impacts. The cogeneration facility may result in additional emissions; however, emissions of some pollutants may be lower due to

Willets Point Development

stringent regulatory requirements for gas turbines and reciprocating engines used to generate power, and the availability of advanced air pollution control systems which are effective in minimizing and reducing emissions. Therefore, future environmental review would ensure that any facilities allowed by the Special District regulations incorporate measures to avoid the potential for significant adverse impacts on air quality. *

A. INTRODUCTION

There is general consensus in the scientific community that the global climate is changing as a result of increased concentrations of greenhouse gases (GHGs) in the atmosphere. GHGs are those gaseous constituents of the atmosphere, from both natural and anthropogenic (i.e., resulting from the influence of human beings) emission sources, that absorb infrared radiation (heat) emitted from the earth's surface, the atmosphere, and clouds. This property causes the general warming of the earth's atmosphere, or the "greenhouse effect."

As discussed in the 2012 *CEQR Technical Manual*, climate change could have wide-ranging effects on the environment, including rising sea levels, increases in temperature, and changes in precipitation levels. Although this is occurring on a global scale, the environmental effects of climate change are also likely to be felt at the local level. Through PlaNYC, the City has established sustainability initiatives and goals for both greatly reducing GHG emissions and adapting to climate change in the City. The goal to reduce citywide GHG emissions 30 percent below 2005 levels by 2030 was codified by Local Law 22 of 2008, known as the New York City Climate Protection Act (the "GHG reduction goal"). See §24-803 of the Administrative Code of the City of New York. Per the 2012 *CEQR Technical Manual*, the City's citywide GHG reduction goal is currently the most appropriate standard by which to analyze a project under CEQR. The City is also engaged in several initiatives related to assessing potential local impacts of global climate change and developing strategies to make existing and proposed infrastructure and development more resilient to potential effects of climate change.

This chapter discusses the projected GHG emissions from the proposed project and the reasonable worst-case development scenario (RWCDS). To achieve the Leadership in Energy and Environmental Design (LEED®) rating by the United States Green Building Council (USGBC), as described in Chapter 13, "Energy" and in more detail in this chapter, a range of sustainable design and energy efficiency measures that would reduce GHG emissions would be considered. Those measures are discussed in this chapter in the context of the GHG reduction goal. Planned improvements, which would increase the resilience of the project to current weather conditions and to ~~some of the~~ potential effects of climate change through the 2050s, are described. Also described are additional strategies for protecting the project infrastructure, which would be implemented if needed based on future regulations and guidance, as well as future efforts that the City may undertake on a larger scale to make coastal areas more resilient to longer-term increases in sea levels, for which projections have not yet been updated.

PRINCIPAL CONCLUSIONS

As discussed in the following sections, the building energy use and vehicle use associated with the full build-out of the proposed project would result in approximately 150,000 metric tons of carbon dioxide equivalent (CO₂e) emissions per year. The RWCDS, which includes the potential future development on Lot B, would result in approximately 161,000 metric tons of CO₂e emissions from building energy consumption and vehicle use. The overall RWCDS emissions

are lower than those presented in Technical Memorandum #4 (TM4), despite the increase in the floor area proposed for development, due to the expected improvement in vehicle efficiency from 2022, the final build year analyzed in TM4; and 2032, the anticipated year of proposed project completion.

The proximity of the proposed development to public transportation, its mixed-use nature, and dense design are all factors that contribute to the energy efficiency. To meet the requirements of LEED® certification, the energy cost reduction requirements of Local Law 86 of 2005, and to comply with the regulations of the Special Willets Point District, specific measures would be incorporated into the proposed project design, which would decrease the potential GHG emissions and further the GHG reduction goal.

As additional detailed local climate change projections become available and are adopted into the City's infrastructure design criteria, such criteria would be incorporated into the development program. In addition, an engineering study would be prepared prior to commencement of construction that would assess the feasibility of implementing strategies to improve resilience to climate change impacts into the design of the development program, in light of the most current climate change projections. Based on that engineering study, practicable strategies to improve resilience to climate change would be implemented.

B. SUMMARY OF FINDINGS, 2008 FGEIS AND SUBSEQUENT TECHNICAL MEMORANDA

The 2008 FGEIS did not include an analysis of GHG emissions, as the analysis was not required under CEQR at the time. The 2008 FGEIS did, however, address the potential effects of climate change, in Chapter 14, "Water and Sewer Infrastructure," as well as in Chapter 29, "Response to Comments on the DGEIS." Accounting for the 2010 revisions of the *CEQR Technical Manual*, which included guidance on addressing GHG emissions, TM4 included Appendix E, which disclosed the GHG emissions from the full build-out of the Updated Plan, No Convention Center Scenario, and the anticipated development on Lots B and D. The TM4 Appendix also discussed measures to reduce GHG emissions and measures to make the project more resilient to the potential effects of sea level rise.

C. GHG EMISSIONS

POLICY, REGULATIONS, STANDARDS, AND BENCHMARKS FOR REDUCING GHG EMISSIONS

Countries around the world have undertaken efforts to reduce emissions by implementing both global and local measures addressing energy consumption and production, land use, and other sectors. Although the U.S. has not ratified the international agreements which set emissions targets for GHGs, in a step toward the development of national climate change regulation, the U.S. has committed to reducing emissions to 17 percent lower than 2005 levels by 2020 and to 83 percent lower than 2005 levels by 2050 (pending legislation) via the Copenhagen Accord.¹ Without legislation focused on this goal, the U.S. Environmental Protection Agency (USEPA) is required to regulate GHGs under the Clean Air Act (CAA), and has begun preparing regulations addressing newly manufactured vehicles and permitted large stationary sources. In addition, the

¹ Todd Stern, U.S. Special Envoy for Climate Change, letter to Mr. Yvo de Boer, UNFCCC, January 28, 2010.

American Recovery and Reinvestment Act of 2009 (ARRA, “economic stimulus package”) funded actions and research that can lead to reduced GHG emissions, and the Energy Independence and Security Act of 2007 includes provisions for increasing the production of clean renewable fuels, increasing the efficiency of products, buildings, and vehicles, and for promoting research on GHG capture and storage options.

U.S. Department of Transportation (USDOT) and USEPA have also established GHG emission standards and more stringent combined corporate average fuel economy (CAFE) standards for vehicles. These regulations will all serve to reduce vehicular GHG emissions over time.

There are also regional, state, and local efforts to reduce GHG emissions. In 2009, Governor Paterson issued Executive Order No. 24, establishing a goal of reducing GHG emissions in New York by 80 percent, compared to 1990 levels, by 2050, and creating a Climate Action Council tasked with preparing a climate action plan outlining the policies required to attain the GHG reduction goal (that effort is currently under way¹). The 2009 New York State Energy Plan² outlines the state’s energy goals and provides strategies and recommendations for meeting those goals. The state’s goals include:

- Implementing programs to reduce electricity use by 15 percent below 2015 forecasts;
- Updating the energy code and enacting product efficiency standards;
- Reducing vehicle miles traveled by expanding alternative transportation options; and
- Implementing programs to increase the proportion of electricity generated from renewable resources to 30 percent of electricity demand by 2015.

New York State has also developed regulations to cap and reduce CO₂ emissions from power plants to meet its commitment to the Regional Greenhouse Gas Initiative (RGGI). Under the RGGI agreement, the governors of 10 Northeast and Mid-Atlantic states have committed to regulate the amount of CO₂ that power plants are allowed to emit. The regional emissions cap for power plants will be held constant through 2014, and then gradually reduced to 10 percent below the initial cap through 2018. The RGGI states and Pennsylvania have also announced plans to reduce GHG emissions from transportation, through the use of biofuel, alternative fuel, and efficient vehicles.

Many local governments worldwide, including New York City, are participating in the Cities for Climate Protection campaign and have committed to adopting policies and implementing quantifiable measures to reduce local GHG emissions, improve air quality, and enhance urban livability and sustainability. New York City’s long-term sustainability program, PlaNYC 2030, includes GHG emissions reduction goals, specific initiatives that can result in emission reductions and initiatives targeted at adaptation to climate change impacts. For certain projects subject to CEQR, an analysis of the project’s GHG emissions and an assessment of the project’s consistency with the City’s citywide emission reduction goal are required.

In 2005, the New York City Council enacted one of the nation’s first green building laws (Local Law 86 of 2005). Local Law 86 of 2005 requires new buildings, additions, and substantial building reconstruction work in capital projects that receive city funds to be built in accordance with the rigorous standards of the Leadership in Energy and Environmental Design (LEED®) green building rating systems developed by the U.S. Green Building Council (USGBC). It also

¹ <http://www.dec.ny.gov/energy/80930.html>

² New York State, 2009 New York State Energy Plan, December 2009.

requires that most of this work, as well as larger lighting, boiler, HVAC controls, and plumbing upgrade work, be designed to reduce the use of both energy and potable water well beyond that required by the current NYC building code.

In December 2009, the New York City Council enacted four laws addressing energy efficiency in new and existing buildings, in accordance with PlaNYC. The laws require owners of existing buildings larger than 50,000 square feet to conduct energy efficiency audits every 10 years, to optimize building energy efficiency, and to “benchmark” the building energy and water consumption annually, using a USEPA online tool. By 2025, commercial buildings over 50,000 square feet will also require lighting upgrades, including the installation of sensors and controls, more efficient light fixtures, and the installation of sub-meters, so that tenants can be provided with information on their electricity consumption. The legislation also created a New York City Energy Code, which along with the New York State Energy Conservation Code (as revised in 2010), requires equipment installed during a renovation to meet energy efficiency standards.

A number of voluntary rating systems for energy efficiency and green building design have also been developed. For example, LEED[®] system is a benchmark for the design, construction, and operation of high performance green buildings that includes energy efficiency components. It is noteworthy that the proposed project would seek certification under LEED[®], as described in more detail in Chapter 13, “Energy,” and subsequent sections of this chapter.

Another voluntary rating system is USEPA’s *Energy Star*—a labeling program designed to identify and promote the construction of new energy efficient buildings, facilities, and homes and the purchase of energy efficient appliances, heating and cooling systems, office equipment, lighting, home electronics, and building envelopes.

METHODOLOGY

Although the contribution of any single project to global climate change is infinitesimal, the combined GHG emissions from all human activity are believed to have a severe adverse impact on global climate. While the increments of criteria pollutants and toxic air emissions are assessed in the context of health-based standards and local impacts, there are no established thresholds for assessing the significance of a project’s contribution to climate change. Nonetheless, prudent planning dictates that all sectors address GHG emissions by identifying GHG sources and practicable means to reduce them. Therefore, this chapter presents an estimate of the total GHG emissions that would be generated with the proposed project and the RWCDs and identifies the measures that would be implemented and measures that are under consideration to limit the emissions from the proposed project.

The analysis of GHG emissions that would be generated by the proposed project and the RWCDs is based on the methodology presented in the *CEQR Technical Manual*. Emissions of GHGs from the proposed project and the RWCDs have been quantified, including off-site emissions associated with use of electricity on-site, on-site emissions from heat and hot water systems, and emissions from vehicle use attributable to the proposed project and RWCDs. GHG emissions that would result from construction of the proposed project are discussed as well.

It should be noted that the analysis conservatively overestimates the net increase in GHG emissions, as it takes no credit for existing emissions at the project site, or emissions that would be generated if the uses that would be accommodated by the proposed project were to be developed elsewhere. For example, without the development of the District, the demand for residential space would be met elsewhere, generating similar demand for heating, hot water, electricity, and transportation, potentially without the energy efficient building design that would be implemented with the proposed

project. The analysis also does not account for the potential reduction in vehicle miles traveled (VMT) associated with the proposed retail at Willets West, which would provide opportunities for commerce closer to the surrounding community than currently available.

Carbon dioxide (CO₂) is the primary pollutant of concern from anthropogenic emission sources and is accounted for in the analysis of emissions from all development projects. GHG emissions for gases other than CO₂ are included where practicable or in cases where they comprise a substantial portion of overall emissions. The various GHG emissions are added together and presented as metric tons of carbon dioxide equivalent (CO₂e) emissions per year, consistent with the New York City annual inventory.¹ CO₂e is a sum that includes the quantity of each GHG weighted by a factor of its effectiveness as a GHG using CO₂ as a reference. This is achieved by multiplying the quantity of each GHG emitted by a factor called global warming potential (GWP). The GWP accounts for the lifetime and the radiative forcing of each gas over a period of 100 years (e.g., CO₂ has a much shorter atmospheric lifetime than SF₆, and therefore has a much lower GWP). The GWPs for the main GHGs discussed are presented in **Table 16-1**.²

Table 16-1
Global Warming Potential (GWP) for Major GHGs

Compound	100-year Horizon GWP
Carbon Dioxide (CO ₂)	1
Methane (CH ₄)	21
Nitrous Oxide (N ₂ O)	310
Hydrofluorocarbons (HFCs)	140 to 11,700
Perfluorocarbons (PFCs)	6,500 to 9,200
Sulfur Hexafluoride (SF ₆)	23,900
Sources: IPCC, Climate Change 1995—The Science of Climate Change: Contribution of Working Group I to the Second Assessment of the Intergovernmental Panel on Climate Change, 1996.	

BUILDING OPERATIONAL EMISSIONS

Emissions due to energy use were developed using carbon intensity factors by building type presented in Table 18-3 of the *CEQR Technical Manual* and the floor area by use. The residential building carbon intensity factor was used to calculate the CO₂ emissions associated with the residential floor area, the institutional building carbon intensity factor was used to calculate the CO₂ emissions associated with the school and community facility floor area, and the commercial building carbon intensity factor was used for all other uses.

MOBILE SOURCE EMISSIONS

The number of annual weekday and weekend vehicle trips by mode (cars, taxis, and trucks) that would be generated by the proposed project and RWCDs was calculated for each analysis year (2018, 2028, and 2032) using the transportation planning assumptions discussed in Chapter 15, “Transportation.” The assumptions used in the calculation include average daily weekday and

¹ City of New York, *Inventory of New York City Greenhouse Gas Emissions*, December 2012, by Jonathan Dickinson, Jamil Khan, Douglas Price, Steven A. Caputo, Jr., and Sergej Mahnovski. Mayor’s Office of Long-Term Planning and Sustainability, New York, 2012.

² Following standard protocol for greenhouse gas inventories, and consistent with New York City’s GHG inventory, the GWP factors from IPCC’s Second Assessment Report (1996) are used. These GWP factors are specified for use for national GHG inventories under the Kyoto Protocol.

weekend person trips and delivery trips by proposed use (residential, office, retail, etc.), the percentage of vehicle trips by mode, and the average vehicle occupancy. Travel distances shown in Table 18-4 of the *CEQR Technical Manual* were used in the calculations of annual vehicle miles traveled by cars. The average one way taxi trip distance of 7.88 miles was obtained from Table 18-5 of the *CEQR Technical Manual*. The average truck trip was assumed to be 38 miles, as per the *CEQR Technical Manual*. Table 18-6 was used to determine the percentage of vehicle miles traveled by road type and the mobile GHG emissions calculator was used to obtain the total estimated mobile source GHG emissions attributable to the proposed project.

EPA estimates that the well-to-pump GHG emissions of gasoline and diesel are approximately 22 percent of the tailpipe emissions.¹ Although upstream emissions (emissions associated with production, processing, and transportation) of all fuels can be substantial and are important to consider when comparing the emissions associated with the consumption of different fuels, they are not considered in the analysis of the proposed project. Accounting for tailpipe emissions but not well-to-pump emissions is in accordance with the *CEQR Technical Manual* guidance and the methodology used in developing the New York City GHG inventory, which is the basis of the GHG reduction goal.

The projected annual vehicle miles traveled, which form the basis for the GHG emissions calculations from mobile sources, are presented in **Table 16-2**.

CONSTRUCTION EMISSIONS

Emissions associated with construction of the proposed project and RWCDs have not been estimated explicitly. GHG emissions from building construction (both direct and emissions embedded in the production of materials, including on-site construction equipment, delivery trucks, and upstream emissions from the production of steel, rebar, aluminum, and cement used for construction) are typically in the range of the total emissions from the operation of the project over approximately 5 to 10 years. As the proposed project would also involve remedial work and construction of new infrastructure, the overall GHG emissions during construction would likely be greater.

EMISSIONS FROM SOLID WASTE MANAGEMENT

As discussed in Chapter 12, “Solid Waste and Sanitation,” the proposed project would not fundamentally change the City’s solid waste management system. Therefore, as per the *CEQR Technical Manual*, the GHG emissions from solid waste generation, transportation, treatment, and disposal are not quantified. Space for storage and collection of recyclables (including paper, corrugated cardboard, glass, plastic, and metals) will be provided.

PROJECTED GHG EMISSIONS WITH THE PROPOSED PROJECT

A summary of GHG emissions by emission source type, along with total annual emissions from the proposed project and the RWCDs is presented in **Table 16-3**. Note that much of these emissions would be associated with similar activity outside of the proposed project area. For

¹The annual GHG emissions for the recreation space reflect the use of the space for recreation for 183 days a year.
²As discussed in Chapter 1, "Project Description," the RWCDS includes the potential future development on Lot B as analyzed in the 2008 FGEIS.

example, if buildings were to be constructed elsewhere to accommodate the same number of people as the proposed project, the emissions from the use of electricity, energy for heating and hot water, and vehicle use could exceed those of the proposed project, depending on the location, access to transit, building type, and energy efficiency measures.

As presented above, the estimated energy-related emissions are conservatively high since default rates for city-wide energy consumption by existing buildings from the *CEQR Technical Manual* were applied; new buildings would likely have lower energy demand. Furthermore, to attain the LEED® for Neighborhood Development (LEED®-ND) rating, 90 percent of the floor area to be developed within the District would have to meet an energy efficiency requirement that substantially reduces energy costs compared to the referenced ASHRAE 90.1-2007 standard (equivalent to current New York City energy code). In order to attain LEED® Silver certification and comply with the requirements of Local Law 86, Phases 1A and 1B, including the Willets West portion of the proposed project would include energy efficiency measures that exceed building code requirements. As plans for LEED attainment and energy efficiency measures are at this time not sufficiently specific to quantify the resulting GHG emission reductions, the estimates of emissions from buildings presented in **Table 16-3** are conservatively high.

ELEMENTS OF THE PROPOSED PROJECT THAT WOULD REDUCE GHG EMISSIONS

As described in the 2008 FGEIS, the Willets Point Development Plan had been accepted as a pilot LEED®-ND project by USGBC. Phase 1A and 1B are subject to Local Law 86 of 2005 (see New York City Charter section 224.1) and the project sponsor would comply with the requirements thereof. To the extent Local Law 86 of 2005 applies to any portion of Phase 2, the City would further ensure that the sponsor for Phase 2 complies with the requirements thereof. Accordingly, in Phase 1A, the retail buildings, including the proposed development on the Willets West site, will be designed and constructed to achieve LEED silver certification for core and shell (LEED-CS), and the hotel building will be designed and constructed to achieve LEED silver certification for new construction (LEED-NC). In Phases 1B and 2, as set forth in the FGEIS and reiterated in Technical Memorandum #4, all portions of the project within the Willets Point Special District will be required to achieve LEED-ND certification. Phase 1B buildings will also comply with all the applicable requirements of Local Law 86 of 2005. Specifically, retail, hotel, community facility, and office buildings will be designed and constructed to achieve LEED silver certification pursuant to the LEED rating system that is most appropriate under Local Law 86 (see Section 10-02 of Chapter 10 of Title 43 of the Rules of the City of New York). To meet the requirements of LEED and the energy cost reduction requirements of Local Law 86 of 2005 that are applicable to the project under NYC Charter section 224.1(b)(2)(ii), energy efficiency measures would be incorporated into building designs, as described in this chapter. The requirements of Local Law 86 of 2005 and the commitments set forth in this chapter would be incorporated into the development agreements and/or amended lease agreements. The provisions of the development agreements and/or amended lease agreements, relating to the substance and enforceability of these commitments, would be subject to approval by the Mayor's Office of Environmental Coordination.

The proposed project's dense, mixed-use development and reuse of developed land with access to transit and existing roadways are consistent with sustainable land use planning and smart growth strategies to reduce the carbon footprint of new development. A number of sustainable features that would reduce GHG emissions would be considered in achieving LEED certification and the project's sustainability goals. In addition, the proposed school in the District would be built according to the *New York City Green Schools Guide*,¹ which addresses the sustainable design, construction, and operation of new schools, modernizing projects, and school renovations in New York City. The *Green Schools Guide* and Rating System include strategies that substantially reduce energy costs and water use as compared with buildings constructed to meet code, and require the use of recycled content, and regional materials in construction.

The following text outlines features of the proposed project and measures that would be required by the Special Willets Point District regulations or considered in achieving LEED® certification. The features listed would most directly reduce GHG emissions, addressing the GHG reduction goals as outlined in the *CEQR Technical Manual*.

BUILD EFFICIENT BUILDINGS

- 90 percent of the floor area developed within the District would exceed energy code requirements by at least 10 percent.

¹ New York City School Construction Authority, *New York City Green Schools Guide*, revised May 2009

Willets Point Development

- Phase 1A and 1B are subject to Local Law 86 of 2005, which requires non-residential structures to be designed and constructed to exceed energy code requirements.
- Energy efficient building envelopes would be designed to reduce cooling/heating requirements.
- To the extent feasible, towers within the District would be oriented to create favorable conditions for use of passive and active solar energy strategies.
- High efficiency heating, ventilation and air conditioning (HVAC) systems would be specified, as well as high efficiency domestic hot water systems.
- Highly reflecting roofing material would reduce air conditioning needs in the summer and help mitigate the urban heat island effect.¹
- Spectrally-selective window glazing would optimize daylighting, heat loss and solar heat gain.
- Efficient lighting (including high efficacy fluorescent and LED) with advanced controls such as motion sensors and daylight dimming would reduce energy consumption.
- State-of-the-art Building Management Systems would be incorporated to provide comprehensive control over building HVAC and lighting, and to minimize unnecessary energy use.
- Efficient elevators and escalators would be specified where practicable.
- Efficient appliances and equipment (e.g., Energy Star) would be specified where practicable.
- Efficient, directed exterior lighting would be specified.
- Third party building commissioning would be conducted to ensure proper energy performance of the building energy systems.
- Construction and design guidelines to facilitate sustainable design for build-out by tenants.
- Measures to reduce stormwater runoff would be implemented as discussed in Chapter 11, “Water and Sewer Infrastructure.”
- Low-flow plumbing fixtures would be used to reduce hot water consumption and water pumping energy.
- The landscape would be designed for water efficiency.

USE CLEAN POWER

The District’s zoning regulations allow for the provision of a new cogeneration facility within that portion of the project site, provided that it would primarily serve the District. Cogeneration is not currently proposed as part of Phases 1A and 1B. It is possible that a cogeneration facility could be included as part of Phase 2; however, a developer for Phase 2 has not yet been selected. A cogeneration facility, if proposed or needed at a future time, would require further study and additional approvals. Such studies would require information on the facility location, size, and design that is not presently available. The heating and hot water systems would likely use natural

¹ The urban heat island effect refers to the temperature difference between urban areas and surrounding suburban or rural areas. Much of this temperature difference is attributed to the prevalence of dark roofs and dark colored pavement, which absorb more heat than lighter surfaces, as well as the declining presence of vegetation in cities.

gas, which has a lower carbon content per unit of energy than other fuels, and thus its use generates lower GHG emissions.

The use of solar photovoltaic panels will also be considered on a dedicated area of Willets West, as part of Phase 1A. While further study is needed, early assessments indicate that a considerable amount of electricity may be generated using the solar panels.

TRANSIT-ORIENTED DEVELOPMENT AND SUSTAINABLE TRANSPORTATION

The proximity of the proposed project to transit and the diversity of uses proposed would reduce automobile dependence, and therefore GHG emissions from travel. The proposed project's dense development and reuse of developed land with access to transit and existing roadways are consistent with sustainable land use planning and smart growth strategies to reduce the carbon footprint of new development. In addition, the proposed project would feature the following elements:

- Parking within the District would be sized to meet, but not exceed, parking required by zoning.
- A network of bike lanes and bicycle racks would be available within the District. Provision of changing rooms or showers would be considered.
- Design of streets, sidewalks and street planting within the District would encourage walking.
- Roadway improvements would be made to improve traffic flow.
- Traffic signalization and coordination would aim to improve traffic flow and support pedestrian and bicycle safety.

In addition, a marketing/information program that would include posting and distribution of ride sharing and transit information would likely be developed. Although the proposed project already has excellent access to transit, it is anticipated that service may be extended or expanded, in response to the proposed development and other growth, as discussed in the 2008 FGEIS. These potential improvements include provision of regular Long Island Railroad (LIRR) service to the existing Mets-Willets Point station, which is currently serviced only during game events; additional 7 train service; and extension of bus routes to the District. Preferred on-site parking for alternative vehicles (such as hybrids and electric vehicles) would likely be provided to the extent practicable, and the practicability of including on-site charging stations for electric vehicles will be explored. Dedicated carpool spaces for Willets West employees will also be provided. Options for encouraging carpooling and car sharing in the District will be explored.

REDUCE CONSTRUCTION OPERATION EMISSIONS

As described in Chapter 20, "Construction," an extensive diesel emission reduction program will be implemented during project construction. The program will minimize particulate matter emissions; while particulate matter is not included in the list of standard greenhouse gasses ('Kyoto gases'), recent studies have shown that black carbon—a constituent of particulate matter—may play an important role in climate change.

USE BUILDING MATERIALS WITH LOW CARBON INTENSITY

In meeting the requirements for the appropriate LEED® rating, the use of recycled content in infrastructure would be considered. In addition, for individual buildings throughout the project

site to achieve the required LEED[®] rating, a number of GHG reducing strategies would be considered, including:

- Use of materials with recycled content.
- Use of building materials that are extracted and/or manufactured within the region.
- Wood that is locally produced and/or certified in accordance with the Sustainable Forestry Initiative or the Forestry Stewardship Council's Principles and Criteria would be used for commercial buildings and considered for residential buildings.
- Ultra low sulfur diesel would be used for project construction.
- Cement replacements, such as slag, would be used to the extent practicable.
- Construction waste would be diverted from landfill through reuse and recycle efforts.

In addition, the use of cement produced using lower-GHG fuel, concrete produced with optimized cement content, and design that would reduce the need for concrete and steel would be considered.

CONCLUSIONS

As detailed above in **Table 16-3**, the potential GHG emissions associated with the proposed project in 2032 upon completion of Phase 2 (cumulative with Phases 1A and 1B) are projected to be approximately 150,000 metric tons of CO₂e. The GHG emissions resulting from the RWCDs in 2032 would be approximately 161,000 metric tons of CO₂e. The GHG emissions from Phase 1A (2018) and Phase 1B (2028, cumulative with Phase 1A) would be 41,000 metric tons of CO₂e and 96,000 metric tons of CO₂e, respectively.

Measures for reducing GHG emissions that are included in the District's regulations, or would be considered in achieving the LEED[®] ratings have been identified. Overall, the project site's location, the project's dense, mixed-use design, the commitments to achieve energy efficiency, and other measures incorporated in the proposed project would result in lower GHG emissions than would otherwise be achieved by similar residential and commercial uses, and thus would be consistent with the GHG reduction goal. The greenhouse gas reduction measures, LEED rating requirements, and requirements of Local Law 86 of 2005 would be incorporated into the development agreements and/or amended lease agreements.

D. RESILIENCE TO CLIMATE CHANGE

Currently, standards and a framework for analysis of the effects of climate change on a proposed project are not included in CEQR. However, the recently proposed revisions to the Waterfront Revitalization Program (WRP)¹ address climate change and sea level rise. If finalized, the revisions to the WRP would require consideration of climate change and sea level rise in planning and design of waterfront development. As set forth in more detail in the *CEQR Technical Manual*, the provisions of the WRP are applied by the Department of City Planning and other city agencies when conducting environmental review. Since the project site is in the floodplain, the potential effects of global climate change on the proposed project are considered below, and strategies to increase climate resilience and adaptive management are discussed.

¹ City of New York Department of City Planning, The NYC Waterfront Revitalization Program: Proposed Revisions for Public Review, March 2012, http://www.nyc.gov/html/dcp/html/wrp/wrp_revisions.shtml

DEVELOPMENT OF POLICY TO IMPROVE CLIMATE CHANGE RESILIENCE

In recognition of the important role that the federal government has to play to address adaptation to climate change, a federal executive order signed October 5, 2009, charged the Interagency Climate Change Adaptation Task Force, composed of representatives from more than 20 federal agencies, with recommending policies and practices that can reinforce a national climate change adaptation strategy. The 2011 progress report by the Task Force included recommendations to build resilience to climate change in communities by integrating adaptation considerations into national programs that affect communities, facilitating the incorporation of climate change risks into insurance mechanisms, and addressing additional cross-cutting issues, such as strengthening resilience of coastal, ocean, and Great Lakes communities.¹

The New York State Sea Level Rise Task Force was created to assess potential impacts to the state's coastlines from rising seas and increased storm surge. The Task Force has prepared a final report of its findings and recommendations including protective and adaptive measures.² The recommendations are to provide more protective standards for coastal development, wetlands protection, shoreline armoring, and post-storm recovery; to implement adaptive measures for habitats; integrate climate change adaptation strategies into state environmental plans; and amend local and state regulations or statutes to respond to climate change. The Task Force also recommended the formal adoption of projections of sea level rise. The New York State Climate Action Plan will also include strategies for adapting to climate change. The Climate Action Plan Interim Report identified a number of policy options and actions that could increase the climate change resilience of natural systems, the built environment, and key economic sectors—focusing on agriculture, vulnerable coastal zones, ecosystems, water resources, energy infrastructure, public health, telecommunications and information infrastructure, and transportation.³

In New York City, the Climate Change Adaptation Task Force is tasked with securing the city's critical infrastructure against rising seas, higher temperatures, and fluctuating water supplies projected to result from climate change. The Task Force is composed of over 35 New York City and State agencies, public authorities, and companies that operate, regulate, or maintain critical infrastructure in New York City. The approaches suggested for the City to create a city-wide adaptation program include ways to assess risks, prioritize strategies, and examine how standards and regulations may need to be adjusted in response to a changing climate.

To assist the task force, the New York City Panel on Climate Change (NPCC), has prepared a set of climate change projections for the New York City region,⁴ updated in June 2013,⁵ and has suggested approaches to create an effective adaptation program for critical infrastructure.⁶ The NPCC includes leading climatologists, sea-level rise specialists, adaptation experts, and engineers, as well as representatives from the insurance and legal sectors. The climate change

² New York State Sea Level Rise Task Force, *Report to the Legislature*, December 2010.

³ NYSERDA, New York State Climate Action Plan Interim Report, November, 2010.

⁴ New York City Panel on Climate Change, *Climate Risk Information*, February 2009.

⁵ New York City Panel on Climate Change, *Climate Risk Information 2013*, June 2013.

⁶ New York City Panel on Climate Change, *Climate Change Adaptation in New York City: Building a Risk Management Response*, Annals of the New York Academy of Sciences, May 2010.

projections include a summary of ~~previously published~~ baseline and projected climate conditions throughout the 21st century including heat waves and cold events, intense precipitation and droughts, sea level rise, and coastal storm levels and frequency. The NPCC projects that sea levels are likely to increase by ~~42~~11 to ~~23~~24 inches by the ~~end~~ middle of the century (2050s middle range, 25th to 75th percentile), with possible increase up to ~~55~~31 inches (high estimate, 90th percentile) ~~in the event of rapid ice melt~~. While the 2013 update did not include 2080s data, based on 2009 NPCC report, sea levels could rise by up to 59 inches by 2080s. Local Law 42 of 2012 requires updates to climate projections at least every three years. In general, the probability of ~~higher~~ sea levels rise is characterized as “extremely likely” (>95 percent probability of occurrence), ~~but there is high uncertainty regarding the probability of a rapid ice melt scenario~~. Intense hurricanes are characterized as “more likely than not” to increase in intensity and/or frequency, and the likelihood of changes in other large storms (“Nor’easters”) are characterized as unknown. Therefore, the projections for future 1-in-100 coastal storm surge levels for New York City include only sea level rise at this time ~~(excluding the rapid ice melt scenario)~~, and do not account for changes in storm frequency. Regardless of the frequency of the storms, the frequency of flooding events would increase because the sea level rise would result in flooding due to lesser storms, such that the current flood with 1 percent chance of occurring in any given year would have a 5 percent chance of occurring in any given year by mid-century, and higher by the end of the century.

In the wake of Hurricane Sandy, Mayor Bloomberg convened the Special Initiative for Rebuilding and Resiliency (SIRR) and charged it with analyzing the impacts of the storm on the City’s buildings, infrastructure, and people; assessing the risks the City faces from climate change; and outlining ambitious, comprehensive, but achievable strategies for increasing resiliency citywide. The Mayor also asked SIRR to develop proposals for rebuilding the areas hardest hit by Sandy—the Brooklyn-Queens Waterfront, the eastern and southern shores of Staten Island, Southern Queens, Southern Brooklyn, and Southern Manhattan. SIRR published the City’s resiliency policy, entitled *A Stronger, More Resilient New York*, in June 2013. Although the plan outlines a general approach for coastal protection throughout the City, the plan does not yet outline specific measures in the area of the proposed project.

~~The New York City Green Code Task force has also recommended strategies for addressing climate change resilience in buildings and for improving stormwater management.⁴ Some of the recommendations call for further study, while others could serve as the basis for revisions to building code requirements. Notably, one recommendation was to develop flood maps that reflect projected sea level rise and increases in coastal flooding through 2080 and to require new developments within the projected future 100 year floodplain to meet the same standards as buildings in the current 100 year flood zone. The City has been working with the Federal Emergency Management Agency (FEMA) to revise the Flood Insurance Rate Maps (FIRMs) using the detailed Light Detection and Ranging (LiDAR) data.~~

The New York City Department of Environmental Protection is evaluating adaptive strategies for City water and wastewater infrastructure. The City has already developed a *New York City Green Infrastructure Plan*², and a *Sustainable Stormwater Management Plan*.¹ Many of the strategies discussed in these plans would improve the City’s resilience to climate change.

¹ New York City Green Codes Task Force, *Recommendations to New York City Building Code*, February 2010.

² New York City, *New York City Green Infrastructure Plan*, September 2010.

Overall, strategies and guidelines for addressing the effects of climate change are rapidly being developed on all levels of government. Currently, standards and a framework for analysis of the effects of climate change on a proposed project are not included in the *CEQR Technical Manual*. While qualitative guidance on addressing the effect of climate change is in the process of being developed at the national, state, and local levels, no specific requirements for development projects are available at this time. Climate change considerations may be incorporated into state and local laws prior to the construction of the proposed project, and any future development would be constructed to meet or exceed the codes in effect at the time of construction. ~~The requirements of Local Law 86 of 2005, which include LEED rating requirements and measures that would reduce greenhouse gas emissions, would be incorporated as applicable into the development agreements and/or amended lease agreements.~~

RESILIENCE OF THE PROPOSED PROJECT TO CLIMATE CHANGE

~~As presented in Figure 9-1, based on the currently in effect Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRMs), Willets West, the South Lot, and Lots B and D are within the 100-year 1-in-100 floodplain, with a flood elevation of 13 feet NAVD88² 14 feet NGVD29 (All elevations in this chapter are presented relative to the NAVD88 datum.) Most of the District is also within the 100-year 1-in-100 floodplain (with flood elevation of 13 feet 14 feet NGVD29) (with the exception of three small areas located in the northwest area of the proposed project, along the eastern border and along Roosevelt Avenue that are within the 500-year 1-in-500 floodplain—these are likely mapping anomalies, and in one case this is an area that is elevated with material stockpiling.) The existing FIRM 100-year floodplain is currently the only regulatory standard relating to elevation of new development. The City has been working with FEMA to revise the FIRMs. On February 25, 2013, FEMA released Advisory Base Flood Elevation maps for areas in New York City, including the project site. The 100-year flood ABFE for Willets West, and portions of the project site to the south of 37th Avenue, is 12 feet NAVD88. Within the District, for most of the area to the North of 37th Avenue, the 100-year ABFE is 13 feet NAVD88, with the exception of an area mostly to the north of 34th Avenue, which is outside of the advisory 100-year floodplain. Although the ABFE is subject to further review, if it is adopted as part of a future updated Flood Insurance Rate Map, the proposed project would comply with these flood elevations as required by the New York City Building Code.~~

~~On July 2, 2013, FEMA released the latest version of the Best Available Flood Hazard Data (BAFHD)—a draft product preceding the publication of new FIRMs. FEMA encourages communities to use the BAFHD when making decisions about floodplain management and post-Sandy recovery efforts, and these levels have been adopted by New York City for zoning purposes, allowing projects to account for higher base flood elevations for height and other zoning requirements. The 1-in-100 levels are the same as the current FIRM in the northern portion of the District, north of 37th Avenue, and are one foot lower in all other areas of the proposed project.~~

~~Given the proposed project location within the 100-year floodplain, the potential effects of global climate change on the proposed project have been considered. As described above, NPCC~~

¹ New York City, Sustainable Stormwater Management Plan, December 2008.

² Elevations in the in effect map are calculated from the NGVD29 datum; current maps use the NAVD88 datum which is 1.1 feet higher. To transform elevations from the old map, Elevation (NAVD88) = Elevation (NGVD29) – 1.1 feet. Note that all FIRM elevations are rounded to the nearest whole foot.

Willets Point Development

has published projections for sea level rise and the associated flood elevations throughout the current century, and recently updated projections for 2020s and 2050s. In the proposed project area, based on the BAFHD and NPCC projections, it is expected that the 1-in-100 flood level would range up to an elevation of approximately 18 feet north of 37th Avenue in the District, and 17 feet in other proposed project areas by the end of the century. Under the current plan, the District portion of the project site and Willets West would be graded and elevated one foot above the current FIRM floodplain (which is two feet above the BAFHD for all project areas except a portion of the District north of 37th Avenue) such that the occupiable floors would be at an elevation of 14 feet 15 feet NGVD29—and would meet the requirements of the New York City Building Code. It is anticipated that the ABFE maps would be adopted in the near future. The occupiable floors of the proposed buildings are designed to be at an elevation of one to two feet above the ABFE. Therefore, the proposed design would reduce the vulnerability to flood damage as compared to existing conditions, as well as offer resilience in the event of 1 to 2 feet of future sea level rise (above the ABFE), which is expected to occur by mid-century (2050s). within the likely range of sea level rise projections made by NPCC. To achieve the LEED® ND rating, the District would comply with all LEED® ND prerequisites, including Floodplain Avoidance (Smart Location & Linkage, Prerequisite 6). Therefore, as appropriate, development within the District would reflect any changes to the floodplain elevations.

Given that the projections for sea level rise are changing, further measures will be investigated and implemented within the proposed project site to the extent practicable. Prior to commencement of construction for each phase of the project, the project sponsor will work with the Mayor's Office of Environmental Coordination (MOEC) to develop a plan for resilience of the proposed area to be developed in that phase from future flood levels, considering the types of uses proposed; the plan will be designed with the goal of making the project area resilient to end-of-century flood levels in residential areas, and mid-century in other areas. This may be achieved via a combination of practicable measures within the project, potentially including grade change, protection of critical infrastructure, and design elevations, and storm surge protection measures if those are practicable and relevant within the area to be developed in that phase, along with area-wide or waterfront measures to be undertaken by the City outside of the project area, as appropriate. While the plan for each phase may not identify all details necessary for the long-term implementation, it will identify the practicable measures needed for that phase of the project and conceptual measures being considered or undertaken by the City beyond the project site. The plan will be consistent with the City's citywide coastal protection policy as described in *A Stronger, More Resilient New York* through the 2050s.

For sea level rise beyond the 1 to 2 feet projected for mid-century, the most practicable solutions to increase resiliency may include area-wide and/or waterfront solutions, which may need to be implemented off-site by the City. While the City has not yet undertaken the studies needed to select the most effective measure to offer flood protection to the area of Queens that includes Willets Point, some measures that may be undertaken by City agencies in the future include:

- Coastal edge elevation measures;
- The City's tide gate repair study at Flushing Meadows, if relevant;
- Integrated flood protection and storm surge barriers.

The City would also have the authority to require an increase in the proposed grade of the District at the time of such future development via changes to the New York City Building Code, by incorporating changes to the flood level provisions, application of FEMA Flood

~~Insurance Rate Map data, or such~~ via other New York City Executive Orders, rules, or regulations, as may be issued at that time.

The proposed project would incorporate the most recent building code requirements available at the time of construction and consider any prudent guidance and information available. As described in Chapter 11, “Water and Sewer Infrastructure,” the proposed project would include a number of features, in addition to the requirements of the building code and current Department of Environmental Protection (DEP) drainage standards, designed to absorb or retain stormwater and reduce the potential for flooding. These features would form part of a site stormwater management plan that would be reviewed by DEP in light of the developing understanding of the effects of climate change on infrastructure.

Potential risks related to flooding would be considered in locating critical electrical and mechanical systems, residential living areas, waste storage areas, fuel storage tanks, and other vulnerable features. Other measures to increase resilience to climate change would be considered on a case-by-case basis, accounting for site specific vulnerabilities, as well as costs and benefits. The following potential techniques would be considered and incorporated into project design, as appropriate:

- Opportunities to elevate, encase, or design electrical and mechanical equipment to be submersible.
- Use of flood- and salt-water-resistant materials.
- Elevation of structures and usable space to an appropriate design flood elevation that reduces risk with minimal impacts on public space and urban design. The selection of an appropriate design flood elevation would consider projections of likely flood levels, as may be legally required in the future, as well as the lifespan of the project and other project specific information.
- The raising of land or the placement of fill to elevate the proposed project uses above projected future flood levels, if such levels become legally defined in the future.
- Selection of plantings suited to the current and projected future climate including selection of salt-water-tolerant species.
- Securing hazardous materials from the impacts of flooding and wave action due to storm surge.
- Incorporation of design features that would allow the proposed project to be adapted on an ongoing basis in response to changing climate projections and conditions .

~~As part of the plan, prior to the placement of fill, the project sponsor would submit to the Mayor’s Office of Environmental Coordination (MOEC) an assessment of the appropriate grade for the District in light of all available information concerning potential sea level rise and other changes due to likely effects of climate change, while considering the practicability of making such grade changes and other measures available for flood protection.~~

By striving to incorporate reasonable strategies that would increase resilience to the likely projected effects of climate change through 2050s, the proposed project would go beyond the ~~existing CEQR and other~~ legal requirements to address the potential effects of climate change on a project and would be consistent with the City’s SIRR policy. As part of citywide efforts to improve coastal resiliency, it is anticipated that solutions for protecting the area over a longer time horizon will be developed before sea levels rise beyond 1 to 2 feet. *

A. INTRODUCTION

Noise pollution in an urban area comes from many sources. Some sources are activities essential to the health, safety, and welfare of a city's inhabitants, such as noise from emergency vehicle sirens, garbage collection operations, and construction and maintenance equipment. Other sources, such as traffic, are essential to the viability of a city as a place to live and do business. Although these and other noise-producing activities are necessary to a city, the noise they produce is undesirable. Urban noise detracts from the quality of the living environment, and there is increasing evidence that excessive noise represents a threat to public health.

The proposed project would change traffic patterns and volumes in the general vicinity of the project site. Since traffic is a main source of ambient noise, this could lead to changes in the ambient noise levels. In addition, the proposed project includes new parking facilities, which have the potential to result in changes to noise levels. An analysis was designed and conducted to identify and quantify any such impacts.

The noise analysis for the proposed project consists of the following elements:

- A screening analysis to determine locations where traffic generated by the proposed project would have the potential to cause significant noise impacts;
- A detailed analysis of noise due to traffic at any location where, based on the screening analysis, the traffic generated by the proposed project would have the potential to result in significant adverse noise impacts;
- An assessment of noise generated by the proposed new parking at nearby locations; and
- An analysis to determine the level of building attenuation necessary to ensure that interior noise levels at the proposed buildings would satisfy applicable interior noise criteria.

PRINCIPAL CONCLUSIONS

The analysis concludes that noise associated with traffic generated by the proposed project and its associated parking facilities would not be expected to result in any significant increases in noise levels, including at World's Fair Marina Park, which was predicted to experience a significant adverse noise impact in the 2008 Final Generic Environmental Impact Statement (FGEIS) during the Saturday mid-day (MD) time period. This resulted from slightly less incremental traffic noise generated on streets immediately adjacent to the Park between the No Build and Build scenarios analyzed for the proposed project as compared to the 2008 FGEIS analysis. To meet City Environmental Quality Review (CEQR) interior noise level requirements, the analysis prescribes between 31 and 43 dBA of building attenuation for the proposed project buildings, which is similar to the amount of building attenuation specified in the 2008 FGEIS, except for the buildings included in the proposed project very close to the existing elevated subway tracks along Roosevelt Avenue, which would require greater attenuation than the levels

specified in the 2008 FGEIS analysis. Similar to what was predicted in the 2008 FGEIS, noise levels in the newly created open spaces would be greater than the 55 dBA $L_{10(1)}$ prescribed by CEQR criteria, but would be comparable to other parks around New York City and would not constitute a significant adverse impact.

B. SUMMARY OF FINDINGS, 2008 FGEIS AND SUBSEQUENT TECHNICAL MEMORANDA

The 2008 FGEIS determined that traffic generated by the proposed Willets Point Development Plan would have the potential to result in a significant increase in noise levels only at the World's Fair Marina Park north of the District and only during the Saturday midday time period, constituting a significant adverse impact under CEQR impact criteria. The 2008 FGEIS concluded that no feasible mitigation was available to reduce noise levels within the park. With regard to building attenuation, the 2008 FGEIS prescribed between 30 and 37 dBA of building attenuation for buildings within the District, which was to be ensured through E-designations and/or subsequent Restrictive Declarations on the District. This would ensure that noise levels within all project buildings would not exceed the 45 dBA $L_{10(1)}$ CEQR interior noise requirement for residences or 50 dBA L_{10} for commercial uses. The subsequent technical memoranda came to the same conclusions and required building attenuation in the same range as the 2008 FGEIS. The fourth technical memorandum issued after the 2008 FGEIS assumed a buffer area within the district between the area to be redeveloped and the surrounding areas. This buffer would not be included in the proposed project, and the absence of the buffer would not have the potential to result in any additional significant adverse noise impacts not found in the 2008 FGEIS as described in the analysis below.

C. NOISE FUNDAMENTALS

Quantitative information on the effects of airborne noise on people is well-documented. If sufficiently loud, noise may interfere with human activities such as sleep, speech communication, and tasks requiring concentration or coordination. It may also cause annoyance, hearing damage, and other physiological problems. Several noise scales and rating methods are used to quantify the effects of noise on people, taking into consideration such factors as loudness, duration, time of occurrence, and changes in noise level with time. However, it must be noted that all the stated effects of noise on people vary greatly with each individual.

“A”-WEIGHTED SOUND LEVEL (dBA)

Noise is typically measured in units called decibels (dB), which are 10 times the logarithm of the ratio of the sound pressure squared to a standard reference pressure squared. Because loudness is important in the assessment of the effects of noise on people, the dependence of loudness on frequency must be taken into account in the noise scale used in environmental assessments. One of the simplified scales that accounts for the dependence of perceived loudness on frequency is the use of a weighting network, known as “A”-weighting, in the measurement system to simulate the response of the human ear. For most noise assessments, the A-weighted sound pressure level in units of dBA is used in view of its widespread recognition and its close correlation with perception. In the current study, all measured noise levels are reported in dBA. Common noise levels in dBA are shown in **Table 17-1**.

Table 17-1
Common Noise Levels

Sound Source	(dBA)
Military jet, air raid siren	130
Amplified rock music	110
Jet takeoff at 500 meters	100
Freight train at 30 meters	95
Train horn at 30 meters	90
Heavy truck at 15 meters	80–90
Busy city street, loud shout	80
Busy traffic intersection	70–80
Highway traffic at 15 meters, train	70
Predominantly industrial area	60
Light car traffic at 15 meters, city or commercial areas, or residential areas close to industry	50–60
Background noise in an office	50
Suburban areas with medium-density transportation	40–50
Public library	40
Soft whisper at 5 meters	30
Threshold of hearing	0
Note: A 10 dBA increase in level appears to double the loudness, and a 10 dBA decrease halves the apparent loudness. Sources: Cowan, James P. <i>Handbook of Environmental Acoustics</i> , Van Nostrand Reinhold, New York, 1994. Egan, M. David, <i>Architectural Acoustics</i> . McGraw-Hill Book Company, 1988.	

ABILITY TO PERCEIVE CHANGES IN NOISE LEVELS

The average ability of an individual to perceive changes in noise levels is well documented (see **Table 17-2**). Generally, changes in noise levels of less than 3 dBA are barely perceptible to most listeners, whereas changes in noise levels of 10 dBA are normally perceived as doubling (or halving) of noise loudness. These guidelines permit direct estimation of an individual's probable perception of changes in noise levels.

Table 17-2
Average Ability to Perceive Changes in Noise Levels

Change (dBA)	Human Perception of Sound
2–3	Barely perceptible
5	Readily noticeable
10	A doubling or halving of the loudness of sound
20	A "dramatic change"
40	Difference between a faintly audible sound and a very loud sound
Source: Bolt, Beranek and Newman, Inc., <i>Fundamentals and Abatement of Highway Traffic Noise</i> , Report No. PB-222-703. Prepared for Federal Highway Administration, June 1973.	

NOISE DESCRIPTORS USED IN IMPACT ASSESSMENT

Because the sound pressure level unit of dBA describes a noise level at just one moment, and because very few noises are constant, other ways of describing noise over more extended periods have been developed. One way is to describe the fluctuating noise heard over a specific period as if it had been a steady, unchanging sound. For this condition, a descriptor called the "equivalent sound level," L_{eq} , can be computed. L_{eq} is the constant sound level that, in a given situation and period (e.g., 1 hour, denoted by $L_{eq(1)}$, or 24 hours, denoted by $L_{eq(24)}$), conveys the same sound energy as the actual time-varying sound. Statistical sound level descriptors, such as L_1 , L_{10} , L_{50} ,

L_{90} , and L_x , are used to indicate noise levels that are exceeded 1, 10, 50, 90, and x percent of the time, respectively. Discrete event peak levels are given as L_{01} levels.

For purposes of the proposed project, the maximum 1-hour equivalent sound level ($L_{eq(1)}$) has been selected as the noise descriptor to be used in this noise impact evaluation. $L_{eq(1)}$ is the noise descriptor recommended for use in the *CEQR Technical Manual* for vehicular traffic and construction noise impact evaluation, and is used to provide an indication of highest expected sound levels. The 1-hour L_{10} is the noise descriptor used in the *CEQR Technical Manual* noise exposure guidelines for city environmental impact review classification.

D. NOISE STANDARDS AND CRITERIA

Noise levels associated with the construction and operation of the proposed project would be subject to the emission source provisions of the New York City Noise Control Code and to noise criteria set for the CEQR process. Other standards and guidelines promulgated by federal agencies do not apply to project noise control, but are useful to review in that they establish measures of impacts. Construction equipment is regulated by the Noise Control Act of 1972 and the New York City Noise Control Code.

NEW YORK CITY NOISE CONTROL CODE

The New York City Noise Control Code, amended in December 2005, contains prohibitions regarding unreasonable noise, requirements for noise due to construction activities, circulation devices, and specific noise standards, with some specific noise sources being prohibited from being “plainly audible” within a receiving property.

NEW YORK CEQR NOISE CRITERIA

The *CEQR Technical Manual* contains noise exposure guidelines for use in city environmental impact review, and required attenuation values to achieve acceptable interior noise levels. These values are shown in **Tables 17-3** and **17-4**. Noise exposure is classified into four categories: “acceptable,” “marginally acceptable,” “marginally unacceptable,” and “clearly unacceptable.” The *CEQR Technical Manual* criteria shown in **Table 17-4** are based on maintaining an interior noise level for the worst-case hour L_{10} of less than or equal to 45 A-weighted decibels (dBA) for residential uses.

E. IMPACT DEFINITION

As recommended in the *CEQR Technical Manual*, this study uses the following criteria to define a significant adverse noise impact:

- An increase of 5 dBA, or more, in Build $L_{eq(1)}$ noise levels at sensitive receptors (including residences, play areas, parks, schools, libraries, and houses of worship) over those calculated for the No Build condition, if the No Build levels are less than or equal to 60 dBA $L_{eq(1)}$ and the analysis period is not a nighttime period.
- An increase in Build $L_{eq(1)}$ noise levels at sensitive receptors of such that the total Build $L_{eq(1)}$ noise levels would be 65 dBA or greater, if the No Build levels are between 60 and 62 dBA $L_{eq(1)}$ and the analysis period is not a nighttime period.

Table 17-3

Noise Exposure Guidelines For Use in City Environmental Impact Review¹

Receptor Type	Time Period	Acceptable General External Exposure	Airport ³ Exposure	Marginally Acceptable General External Exposure	Airport ³ Exposure	Marginally Unacceptable General External Exposure	Airport ³ Exposure	Clearly Unacceptable General External Exposure	Airport ³ Exposure
Outdoor area requiring serenity and quiet ²		$L_{10} \leq 55$ dBA	----- $L_{dn} \leq 60$ dBA -----	NA	NA	NA	NA	NA	NA
Hospital, nursing home		$L_{10} \leq 55$ dBA		$55 < L_{10} \leq 65$ dBA	----- $60 < L_{dn} \leq 65$ dBA -----	$65 < L_{10} \leq 80$ dBA	(i) $70 \leq L_{dn}$ (ii) $65 < L_{dn} \leq 70$ dBA	$L_{10} > 80$ dBA	----- $L_{dn} \leq 75$ dBA -----
Residence, residential hotel, or motel	7 AM to 10 PM	$L_{10} \leq 65$ dBA		$65 < L_{10} \leq 70$ dBA		$70 < L_{10} \leq 80$ dBA		$L_{10} > 80$ dBA	
	10 PM to 7 AM	$L_{10} \leq 55$ dBA		$55 < L_{10} \leq 70$ dBA		$70 < L_{10} \leq 80$ dBA		$L_{10} > 80$ dBA	
School, museum, library, court, house of worship, transient hotel or motel, public meeting room, auditorium, outpatient public health facility		Same as Residential Day (7 AM-11 PM)		Same as Residential Day (7 AM-11 PM)		Same as Residential Day (7 AM-11 PM)		Same as Residential Day (7 AM-11 PM)	
Commercial or office		Same as Residential Day (7 AM-11 PM)		Same as Residential Day (7 AM-11 PM)		Same as Residential Day (7 AM-11 PM)		Same as Residential Day (7 AM-11 PM)	
Industrial, public areas only ⁴	Note 4	Note 4		Note 4		Note 4		Note 4	

Notes:

(i) In addition, any new activity shall not increase the ambient noise level by 3 dBA or more; (ii) *CEQR Technical Manual* noise criteria for train noise are similar to the above aircraft noise standards: the noise category for train noise is found by taking the L_{dn} value for such train noise to be an L'_{dn} (L_{dn} contour) value.

Table Notes:

¹ Measurements and projections of noise exposures are to be made at appropriate heights above site boundaries as given by American National Standards Institute (ANSI) Standards; all values are for the worst hour in the time period.

² Tracts of land where serenity and quiet are extraordinarily important and serve an important public need, and where the preservation of these qualities is essential for the area to serve its intended purpose. Such areas could include amphitheaters, particular parks or portions of parks, or open spaces dedicated or recognized by appropriate local officials for activities requiring special qualities of serenity and quiet. Examples are grounds for ambulatory hospital patients and patients and residents of sanitariums and nursing homes.

³ One may use FAA-approved L_{dn} contours supplied by the Port Authority, or the noise contours may be computed from the federally approved INM Computer Model using flight data supplied by the Port Authority of New York and New Jersey.

⁴ External Noise Exposure standards for industrial areas of sounds produced by industrial operations other than operating motor vehicles or other transportation facilities are spelled out in the New York City Zoning Resolution, Sections 42-20 and 42-21. The referenced standards apply to M1, M2, and M3 manufacturing districts and to adjoining residence districts (performance standards are octave band standards).

Source: New York City Department of Environmental Protection (adopted policy 1983).

Table 17-4

Required Attenuation Values to Achieve Acceptable Interior Noise Levels

	Marginally Acceptable				Clearly Unacceptable
Noise Level With Proposed Action	$70 < L_{10} \leq 73$	$73 < L_{10} \leq 76$	$76 < L_{10} \leq 78$	$78 < L_{10} \leq 80$	$L_{10} < 80$
Attenuation*	(I) 28 dB(A)	(II) 31 dB(A)	(III) 33 dB(A)	(IV) 35 dB(A)	$36 + (L_{10} - 80)^B$ dB(A)

Notes:

^A The above composite window-wall attenuation values are for residential dwellings. Commercial office spaces and meeting rooms would be 5 dB(A) less in each category. All the above categories require a closed window situation and hence an alternate means of ventilation.

^B Required attenuation values increase by 1 dB(A) increments for L_{10} values greater than 80 dBA.

Source: New York City Department of Environmental Protection.

- An increase of 3 dBA, or more, in Build $L_{eq(1)}$ noise levels at sensitive receptors over those calculated for the No Build condition, if the No Build levels are greater than or equal to 62 dBA $L_{eq(1)}$ and the analysis period is not a nighttime period.
- An increase of 3 dBA, or more, in Build $L_{eq(1)}$ noise levels at sensitive receptors over those calculated for the No Build condition, if the analysis period is a nighttime period (defined by the *CEQR Technical Manual* criteria as being between 10 PM and 7 AM).

F. NOISE PREDICTION METHODOLOGY

GENERAL METHODOLOGY

At all of the receptor sites in the vicinity of the project site, the dominant operational noise sources are vehicular traffic on adjacent and nearby streets and roadways, and train traffic from the elevated No. 7 subway line, which runs along Roosevelt Avenue.

Future noise levels were calculated using either a proportional modeling technique or the Federal Highway Administration (FHWA) *Traffic Noise Model* (TNM) Version 2.5. The proportional modeling technique was used as a screening tool to estimate changes in noise levels. At locations where proportional modeling screening indicated the potential for significant adverse noise impacts, the TNM was used to obtain more detailed results. Both the proportional modeling screening technique and the TNM are analysis methodologies recommended for analysis purposes in the *CEQR Technical Manual*.

The noise analysis examined four weekday conditions: AM, MD, PM, pre-game (before a baseball game at CitiField) time periods; and three weekend conditions: MD, pre-game (before a baseball game at CitiField), and post-game (after a baseball game at CitiField). The selected time periods are when the proposed project would have maximum traffic generation and/or the maximum potential for significant adverse noise impacts based on the traffic studies presented in Chapter 14, "Transportation."

The analysis considers each of the three build years separately.

The proportional modeling and TNM procedures used for the analysis are described below.

PROPORTIONAL MODELING

Proportional modeling was used to determine locations which had the potential for having significant noise impacts and to quantify the magnitude of those potential impacts. Proportional modeling is one of the techniques recommended in the *CEQR Technical Manual* for mobile source analysis.

Using this technique, the prediction of future noise levels where traffic is the dominant noise source is based on a calculation using measured existing noise levels and predicted changes in traffic volumes to determine noise levels in the future without the proposed project (the No Build condition) and with the proposed project (the Build condition). Vehicular traffic volumes are converted into Noise Passenger Car Equivalent (Noise PCE) values, for which one medium-duty truck (having a gross weight between 9,900 and 26,400 pounds) is assumed to generate the noise equivalent of 13 cars, and one heavy-duty truck (having a gross weight of more than 26,400 pounds) is assumed to generate the noise equivalent of 47 cars, and one bus (vehicles designed to carry more than nine passengers) is assumed to generate the noise equivalent of 18 cars. Future noise levels are calculated using the following equation:

$$FNL - ENL = 10 * \log_{10} (F PCE / E PCE)$$

where:

FNL = Future Noise Level

ENL = Existing Noise Level

F PCE = Future Noise PCEs

E PCE = Existing Noise PCEs

Sound levels are measured in decibels and therefore increase logarithmically with sound source strength. In this case, the sound source is traffic volumes measured in Noise PCEs. For example, assume that traffic is the dominant noise source at a particular location. If the existing traffic volume on a street is 100 Noise PCE and if the future traffic volume were increased by 50 Noise PCE to a total of 150 Noise PCE, the noise level would increase by 1.8 dBA. Similarly, if the future traffic were increased by 100 Noise PCE, or doubled to a total of 200 Noise PCE, the noise level would increase by 3.0 dBA.

TRAFFIC NOISE MODEL (TNM)

At receptor sites where preliminary modeling studies using the proportional modeling technique indicated that the future traffic may have the potential to cause noticeable increases in noise levels (i.e., sites 3, 6, and 7), a refined analysis was performed using the TNM (described below).

The TNM is a computerized model developed for the FHWA that calculates the noise contribution of each roadway segment to a given noise receptor. The noise from each vehicle type is determined as a function of the reference energy-mean emission level, corrected for vehicle volume, speed, roadway grade, roadway segment length, and source-receptor distance. Further considerations included in modeling the propagation path include identifying the shielding provided by rows of buildings, analyzing the effects of different ground types, identifying source and receptor elevations, and analyzing the effects of any intervening noise barriers.

FTA PARKING LOT/GARAGE ANALYSIS METHODOLOGY

Noise generated by the parking lots and garages associated with the proposed project would contribute to noise levels at nearby noise receptors. Noise due to vehicles accessing and traversing the proposed parking lots and garages were determined using methodologies set forth in the May 2006 version of the Federal Transit Administration's *Transit Noise and Vibration Impact Assessment* guidance manual. Specifically, parking lots were modeled using the techniques described for general noise assessment of a park and ride lot, and parking garages were modeled using the techniques described for general noise assessment of a parking garage.

The general noise assessment methodology consists of determining the project noise exposure at 50 feet from the center of each parking facility based on the maximum number of automobiles expected to enter and exit the facility in a given hour, and adjusting that level for the distance of each receptor from the center of the parking facility.

ANALYSIS PROCEDURE

The following procedure was used in performing the noise analysis:

- Noise monitoring locations (receptor sites) were selected at noise-sensitive land uses (i.e., residential, church, school, etc.) located near the predicted traffic routes that project-generated traffic would use to access and egress the project site or parking facilities associated with the proposed project.
- Noise monitoring locations were selected adjacent to and on the proposed project site to determine the appropriate level of building attenuation required to satisfy CEQR interior noise level criteria and to compare noise levels at the proposed project's newly created open space with CEQR guidelines.
- Existing noise levels were determined at receptor sites listed above, for each analysis time period, by performing field measurements.
- Using the results of the traffic studies presented in Chapter 14, "Transportation," a screening analysis was performed using the proportional model to identify locations that had the potential for a significant increase in noise levels.
- At locations where the screening analysis indicated the potential for a significant increase in noise levels (i.e., Sites 3, 6, and 7), existing traffic noise levels were calculated at each receptor site, for each analysis time period in each build year, using the TNM and traffic data for existing conditions.
- At locations where the screening analysis indicated the potential for a significant increase in noise levels (i.e., Sites 3, 6, and 7), the calculated TNM existing traffic noise level for each analysis time period was subtracted from the measured existing noise level. The difference between the two reflects the contribution of non-traffic noise sources—such as train noise from the nearby elevated No. 7 subway train—to the existing noise levels. This difference was applied as a correction factor to calculated future traffic noise levels to account for non-traffic noise sources.
- At each location during each analysis time period in each build year, noise levels generated by the proposed project's associated parking lots and garages were determined using the FTA analysis guidelines as described above.
- Future noise levels associated with on-road traffic for the No Action and With Action scenarios, for each receptor site and for each analysis time period in each build year, were determined using either the proportional model or the TNM approach described above.
- Total future noise levels for the No Action and With Action scenarios, for each receptor site and for each analysis time period in each build year, were determined by logarithmically adding the noise levels due to traffic and (for the With Action scenario only) noise levels due to the parking lots and garages.
- The level of building attenuation to satisfy CEQR requirements was determined for the proposed buildings on the project site based on the calculated noise levels in the future with the proposed project.

G. EXISTING CONDITIONS

SITE DESCRIPTION

The study area for this analysis is bounded to the east by Main Street, to the south by Roosevelt Avenue and the MTA Corona Rail Yard, to the west by 111th Street, and to the north by Flushing Bay. This area includes the project site and nearby receptors that would experience increases in traffic on adjacent roadways as a result of the proposed project.

SELECTION OF NOISE RECEPTOR LOCATIONS

Eight noise receptor locations were chosen within and around the project site (see **Figure 17-1**). Site 1 is located on Roosevelt Avenue between 111th and 114th Streets. Site 2 is located on Roosevelt Avenue between College Point Boulevard and Prince Street. Site 3 is located in World's Fair Marina Park. Site 4 is located on Northern Boulevard between 127th Street and 127th Place. Site 5 is located on 126th Street between 36th and 37th Avenues. Site 6 is located on Willets Point Boulevard between 34th Avenue and Northern Boulevard. Site 7 is located on 126th Street between 39th and Roosevelt Avenues. Site 8 is located on Roosevelt Avenue between 114th and 126th Streets.

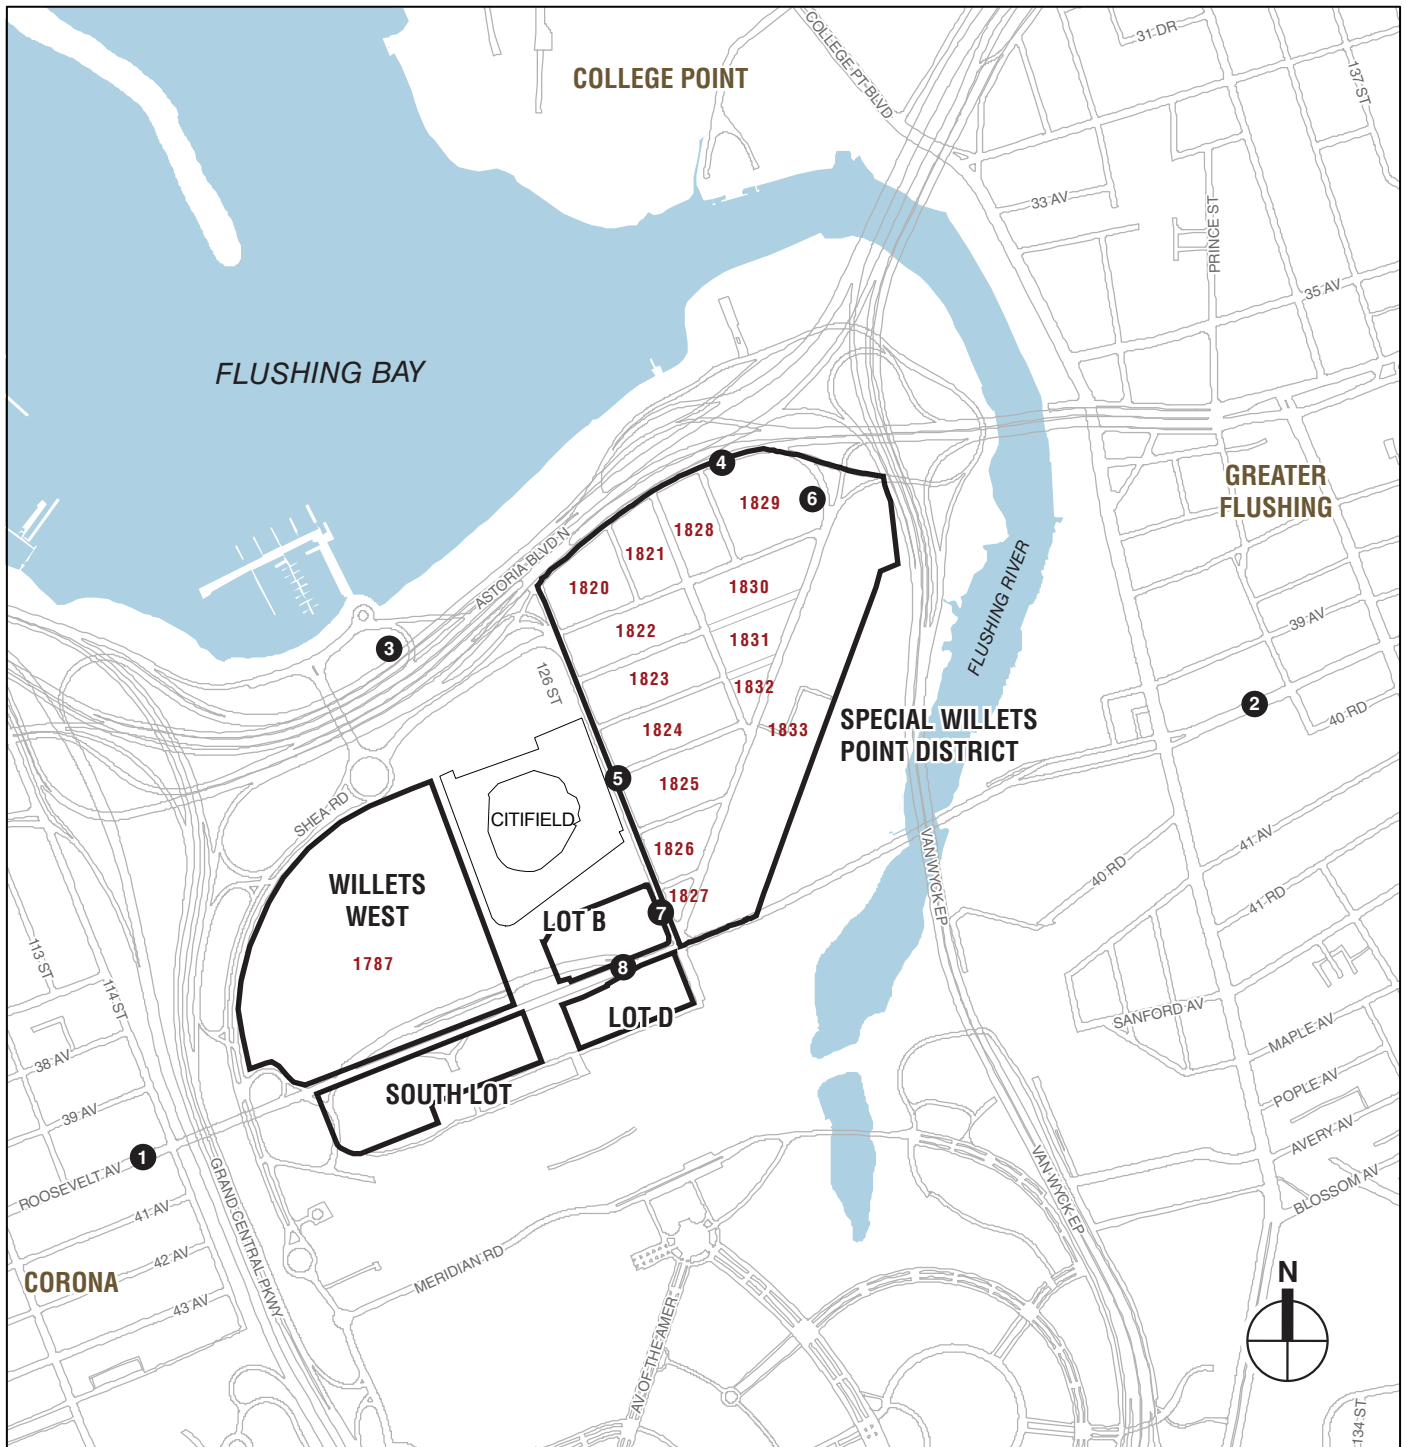

Sites 1–3 were analyzed for impact assessment. These sites are representative of other locations in the immediate area, and are generally the locations where maximum impacts would be expected. These sites were used to assess the potential impacts due to traffic and parking facility noise generated by the proposed and future actions. Sites 4–8 were analyzed to determine the appropriate level of building attenuation for future development.

NOISE MONITORING

At each receptor site, existing noise levels were determined for each of the seven noise analysis time periods by field measurements. Noise monitoring was performed at all eight sites between September 11, 2012 and October 24, 2012. Twenty-minute spot measurements were taken during the three weekday without-baseball-game periods, one Saturday without-baseball-game period, one weekday with-baseball-game period and two Saturday with-baseball-game periods that reflect peak hours of trip generation: AM weekday (7:45–8:45 AM), midday (MD) weekday (1:00–2:00 PM), PM weekday (5:15–6:15 PM), midday (MD) Saturday (1:00–2:00 PM), PM weekday pre-game (6:00–7:00 PM), midday (MD) Saturday pre-game (12:00–1:00 PM), and PM Saturday post-game (3:45–4:45 PM).

EQUIPMENT USED DURING NOISE MONITORING

Measurements were performed using Brüel & Kjær Sound Level Meters (SLM) Type 2250, 2260, and 2270, Brüel & Kjær ½-inch microphones Type 4189, and Brüel & Kjær Sound Level Calibrators Type 4231. The Brüel & Kjær SLMs are Type 1 instruments according to ANSI Standard S1.4-1983 (R2006). The SLMs had a laboratory calibration date within one year of the time of use. The microphones were mounted at a height of approximately five feet above the ground surface on a tripod and approximately six feet or more away from any large sound-reflecting surface to avoid major interference with sound propagation. The SLMs were field calibrated before and after readings with a Brüel & Kjær Type 4231 Sound Level Calibrator using the appropriate adaptor. The data were digitally recorded by the SLMs and displayed at the end of the measurement period in units of dBA. Measured quantities included the L_{eq} , L_1 , L_{10} , L_{50} , L_{90} , and 1/3 octave band data. A windscreen was used during all sound measurements except for calibration. All measurement procedures were based on the guidelines outlined in ANSI Standard S1.13-2005.

EXISTING NOISE LEVELS AT NOISE RECEPTOR LOCATIONS

MEASURED NOISE LEVELS

Noise monitoring results for the eight receptor locations are summarized in **Tables 17-5** and **17-6**. The elevated No. 7 subway line was the dominant noise source at Sites 1, 7, and 8. Traffic was the dominant noise source at Sites 2–6. Noise levels are generally relatively high, and reflect the level of activity in the area.

		Saturday	pre-game	78.8	92.2	79.6	69.1	64.3
		Saturday	post-game	79.5	92.5	82.2	68.9	64.2
Note: Field measurements were performed by AKRF, Inc. between September 11, 2012 and October 24, 2012.								

In terms of CEQR noise criteria, noise levels at Sites 2, 3, 5, 6, and 7 are in the “marginally unacceptable” category, and noise levels at Sites 1, 4, and 8 are in the “clearly unacceptable” category.

H. THE FUTURE WITHOUT THE PROPOSED PROJECT

2018 ANALYSIS YEAR

Using the methodology previously described, future noise levels in the 2018 No-Action condition were calculated for Site 1–3 for all seven analysis periods. **Table 17-7** shows the calculated noise levels.

Comparing future 2018 No Action conditions with existing conditions, the maximum increase in L_{eq(1)} noise levels would be less than 2.0 dBA. Increases of this magnitude would be barely perceptible and insignificant under CEQR criteria.

In terms of CEQR noise criteria, noise levels at Sites 2 and 3 would remain in the “marginally unacceptable” category, and Site 1 would remain in the “clearly unacceptable” category.

2028 ANALYSIS YEAR

Using the methodology previously described, future noise levels in the 2028 No-Action condition were calculated for Sites 1–3 for all seven analysis periods. **Table 17-8** shows the calculated noise levels.

Table 17-7
2018 No Action Noise Levels (in dBA)

Site ²	Day	Time	Existing L _{eq(1)}	2018 No Action L _{eq(1)}	Change	2018 No Action L ₁₀₍₁₎

	Saturday	pre-game	71.1	71.2	0.1	72.6
	Saturday	post-game	70.4	70.5	0.1	72.2
Notes:						
¹ Future noise levels at this location were calculated using the TNM modeling technique.						
² Sites 4-8 were used solely for the purpose of determining the building attenuation required, and are therefore not presented in the No Action and future with the proposed project scenarios.						

Comparing future 2028 No Action conditions with existing conditions, the maximum increase in $L_{eq(1)}$ noise levels would be less than 2.0 dBA. Increases of this magnitude would be barely perceptible and insignificant under CEQR criteria.

In terms of CEQR noise criteria, noise levels at Sites 2 and 3 would remain in the “marginally unacceptable” category, and Site 1 would remain in the “clearly unacceptable” category.

2032 ANALYSIS YEAR

Using the methodology previously described, future noise levels in the 2032 No-Action condition were calculated for Sites 1–3 for all seven analysis periods. **Table 17-9** shows the calculated noise levels.

Table 17-9
2032 No Action Noise Levels (in dBA)

Site ²	Day	Time	Existing $L_{eq(1)}$	2032 No Action $L_{eq(1)}$	Change	2032 No Action $L_{10(1)}$
1	Weekday	AM	82.0	83.8	1.8	86.9
	Weekday	MD	77.1	79.0	1.9	82.9

	Saturday	post-game	70.4	70.5	0.1	72.2
Notes: ¹ Future noise levels at this location were calculated using the TNM modeling technique. ² Sites 4–8 were used solely for the purpose of determining the building attenuation required, and are therefore not presented in the No Action and With Action scenarios.						

Comparing future 2032 No Action conditions with existing conditions, the maximum increase in $L_{eq(1)}$ noise levels would be less than 2.0 dBA. Increases of this magnitude would be barely perceptible and insignificant under CEQR criteria.

In terms of CEQR noise criteria, noise levels at Sites 2 and 3 would remain in the “marginally unacceptable” category, and Site 1 would remain in the “clearly unacceptable” category.

I. PROBABLE IMPACTS OF THE PROPOSED PROJECT

PHASE 1A (2018)

Using the methodology described above, noise levels in the future with the proposed project (2018) were calculated for Sites 1–3 for all seven analysis periods. **Table 17-10** shows the calculated noise levels.

Table 17-10
2018 With Action Noise Levels (in dBA)

Site ²	Day	Time	2018 No Action L _{eq(1)}	2018 With Action L _{eq(1)}	Change	2018 With Action L ₁₀₍₁₎
1	Weekday	AM	83.6	83.7	0.1	86.8
	Weekday	MD	78.9	79.1	0.2	83.0
	Weekday	PM	86.5	86.8	0.3	90.5
	Saturday	MD	77.9	78.2	0.3	81.0

Notes: ¹ Future noise levels at this location were calculated using the TNM modeling technique. ² Sites 4–8 were used solely for the purpose of determining the building attenuation required, and are therefore not presented in the No Action and future with the proposed project scenarios.						

J. BUILDING ATTENUATION FOR PROJECT BUILDINGS

The *CEQR Technical Manual* also requires an analysis of the effect of introducing a sensitive use, such as a residential building, into an urban environment. As shown in **Table 17-4** above, the *CEQR Technical Manual* has set noise attenuation values for new buildings that are to be constructed as part of a proposed action, based on exterior noise levels. Recommended noise attenuation values for residential and school buildings are designed to maintain interior noise levels of 45 dBA L₁₀₍₁₎ (50 dBA L₁₀₍₁₎ for commercial uses) or lower and are determined based on exterior L₁₀₍₁₎ noise levels.

Table 17-13 shows the highest calculated L₁₀₍₁₎ noise levels at the receptor locations in the study area and the building attenuation that would be required to achieve acceptable interior noise levels at each location.

Based on the values shown in **Table 17-13**, required attenuation levels were determined for all building sites. These values are shown in **Table 17-14**.

Table 17- 13
Minimum Building Attenuation to Comply With CEQR Requirements

Site	Location	Maximum L _{10(t)} (dBA)	Required Building Attenuation (dBA) ¹
4	Northern Boulevard between 127th Street and 127th Place	82.5	39
5	126th Street between 36th Avenue and 37th Avenue	75.9	31
6 ²	Willeys Point Boulevard between 34th Avenue and Northern Boulevard	76.6	33
7 ²	126th Street between 39th Avenue and Roosevelt Avenue	79.7	35
8	Roosevelt Avenue between 114th Street and 126th Street	91.4	43 ³
Notes: ¹ Required attenuation values shown are for residential, except where noted. Commercial uses would require 5 dBA less attenuation. ² Future with the proposed project noise levels at these locations were calculated using the TNM modeling technique. ³ The projected land use adjacent to this site are commercial. Should residential or classroom uses be constructed instead, they would require 5 dBA more attenuation.			

Table 17-14
Minimum Building Attenuation to Comply with CEQR Requirements at the Project Site (in dBA)

	East, West, South	6	76.6	33
1830	North, East, South	6	76.6	33
	West	5	75.9	31
1831	North, South, West	5	75.9	31
	East	6	76.6	33
1832	North, West	5	75.9	31
	East	6	76.6	33
1833	All (north of 38th Avenue)	6	76.6	28 ²
	North, East West (south of 38th Avenue)	7	79.7	30 ²
	South (south of 38th Avenue)	8	91.4	43 ²
Notes: ¹ Required attenuation values shown are for residential uses, except where noted. Commercial uses would require 5 dBA less attenuation. ² The projected land use at these locations are commercial. Should residential or classroom uses be constructed instead, they would require 5 dBA more attenuation.				

The attenuation of a composite structure is a function of the attenuation provided by each of its component parts and how much of the area is made up of each part. Normally, a building façade is composed of the wall, glazing, and any vents or louvers for HVAC/air conditioning units in various ratios of area. The proposed design for all project buildings includes the use of well-sealed double-glazed windows and air conditioning units. The proposed buildings' façades, including these elements, would be designed to provide a composite Outdoor-Indoor Transmission Class (OITC) rating greater than or equal to the attenuation requirements listed in **Table 17-14**. The OITC classification is defined by the American Society of Testing and Materials (ASTM E1332-90 [Reapproved 2003]) and provides a single-number rating that is used for designing a building façade including walls, doors, glazing, and combinations thereof. The OITC rating is designed to evaluate building elements by their ability to reduce the overall loudness of ground and air transportation noise. By adhering to these design requirements, the proposed buildings will thus provide sufficient attenuation to achieve the CEQR interior noise level guideline of 45 dBA L_{10} for residential uses and 50 dBA L_{10} for commercial uses.

Specifically, the attenuation requirements shown for the District in **Table 17-14** would be implemented through the E-designations that are already in place; these requirements would supersede the requirements previously set forth for the E-designations. For lots outside of the District, the attenuation requirements shown in **Table 17-14** would be incorporated into the development agreements and/or amended leases for each lot. These lots are and would remain in City ownership.

K. NOISE LEVELS AT OPEN SPACE AREAS

As with existing and No Action conditions, noise levels within the new public open spaces to be created within the District as part of the proposed project would be above the 55 dBA $L_{10(1)}$. This exceeds the noise level for outdoor areas requiring serenity and quiet contained in the *CEQR Technical Manual* noise exposure guidelines (see **Table 17-3**). There are no practical and feasible mitigation measures that could be implemented to reduce noise levels to below the 55 dBA $L_{10(1)}$ guideline within the open space areas. Although noise levels in these new areas would be above the 55 dBA $L_{10(1)}$ guideline noise level, they would be comparable to or lower than noise levels in a number of open space areas that are within range of substantial noise sources (e.g., roadways, aircraft, etc.), including Prospect Park, Brooklyn Bridge Park, and Fort Greene Park. The 55 dBA $L_{10(1)}$ guideline is a worthwhile goal for outdoor areas requiring serenity and quiet. However, due to the level of activity present at most New York City open space areas and parks (except for areas far away from traffic and other typical urban activities), this relatively low noise level is often not achieved.

L. MECHANICAL EQUIPMENT

The building mechanical systems (i.e., heating, ventilation, and air conditioning systems) would be designed to meet all applicable noise regulations (i.e., Subchapter 5, §24-227 of the New York City Noise Control Code addressing circulation devices and the New York City Department of Buildings and Mechanical Codes) to avoid producing levels that would result in any significant increase in ambient noise levels. *

A. INTRODUCTION

The *City Environmental Quality Review (CEQR) Technical Manual* defines as its goal with respect to public health “to determine whether adverse impacts on public health may occur as a result of a proposed project, and if so, to identify measures to mitigate such effects.”

According to the *CEQR Technical Manual*, for most proposed projects, a public health analysis is not necessary. Where no significant unmitigated adverse impact is found in other CEQR analysis areas, such as air quality, water quality, hazardous materials, or noise, no public health analysis is warranted. If an unmitigated significant adverse impact is identified in one of these analysis areas, the lead agency may determine that a public health assessment is warranted for that specific technical area.

As described in the relevant analyses of this Final Supplemental Environmental Impact Statement (FSEIS), during construction and after completion of construction the proposed project would not result in unmitigated significant adverse impacts in any of the technical areas related to public health. Therefore, a public health analysis is not necessary, as the proposed project would not result in a significant adverse public health impact. *

A. INTRODUCTION

This chapter assesses whether any changed background conditions or the differences between the reasonable worst-case development scenario (RWCDS) and the program assessed in the 2008 Final Generic Environmental Impact Statement (FGEIS) and subsequent technical memoranda would result in any significant adverse impacts on neighborhood character that were not addressed in the 2008 FGEIS and subsequent technical memoranda.

As defined in the *City Environmental Quality Review (CEQR) Technical Manual*, neighborhood character is an amalgam of various elements that give neighborhoods their distinct “personality.” These elements may include a neighborhood’s land use, urban design, visual resources, historic resources, socioeconomics, traffic, and/or noise. However, not all of these elements affect neighborhood character in all cases; a neighborhood usually draws its character from a few determining elements.

PRINCIPAL CONCLUSIONS

Consistent with the 2008 FGEIS and subsequent technical memoranda, this analysis finds that the proposed project would not result in any significant adverse impacts to neighborhood character.

As described in detail below, the study area has diverse characteristics owing to the varied land uses surrounding the project site. No one defining feature would be considered critical to the character of the neighborhood; rather all the various localized features contribute to it. Taking into consideration the effects of the proposed project on the contributing features, the proposed project would not have a significant adverse impact on neighborhood character. Rather, the proposed project would result in an improvement in neighborhood character, as it would remediate the area and would represent a significant investment to improve the project area’s infrastructure. The proposed project would allow for a more comprehensive and continuous neighborhood by linking Flushing and Corona, and would transform the area surrounding CitiField into a thriving new neighborhood and regional destination.

B. SUMMARY OF FINDINGS—2008 FGEIS AND SUBSEQUENT TECHNICAL MEMORANDA

The 2008 FGEIS concluded that while the proposed changes to the District would be significant, they would result in an improvement in neighborhood character and would not have a significant adverse impact. The development proposed in the 2008 FGEIS would have dramatically changed neighborhood character in the District, replacing predominantly low-density auto-related, manufacturing, warehousing and distribution, and waste transfer and recycling uses with a new mixed-use neighborhood. The Special Willets Point District regulations were developed to create a dynamic, sustainable community by integrating regional attractions, residential (with

approximately 20 percent affordable housing), retail, and other uses within a network of pedestrian-scaled streetscapes. The 2008 FGEIS also concluded that the proposed convention center and commercial uses would enhance Flushing and Corona's roles as regional economic centers, and would attract visitors to the area. The proposed residential, commercial office, retail, hotel, community facility, open space, and parking uses would be consistent with the uses and character in the surrounding area, particularly those within the dense commercial center of Downtown Flushing. Subsequent technical memoranda also concluded that there would be no significant adverse impacts on neighborhood character.

C. METHODOLOGY

The *CEQR Technical Manual* states that an assessment of neighborhood character is generally needed when a proposed project has the potential to result in significant adverse impacts in any of the following technical areas: land use, zoning, and public policy; socioeconomic conditions; open space; historic and cultural resources; urban design and visual resources; shadows; transportation; or noise. Even if a project does not have the potential to result in a significant adverse impact in any of the technical areas listed above, an assessment may be required if the project would result in a combination of moderate effects to several elements that cumulatively may affect neighborhood character. According to the *CEQR Technical Manual*, a "moderate" effect is generally defined as an effect considered reasonably close to the significant adverse impact threshold for a particular technical analysis area.

As described in the relevant chapters of this Final Supplemental Environmental Impact Statement (EISEIS), the proposed project would not result in significant adverse impacts in the areas of land use, zoning, and public policy; socioeconomic conditions; open space; urban design and visual resources; shadows; or noise. It would also not result in effects considered reasonably close to the significant adverse impact thresholds in those technical areas. However, the proposed project would result in significant adverse impacts in the areas of historic and cultural resources, and transportation. Therefore, a preliminary assessment of neighborhood character impacts from the proposed project is provided below.

The analysis of neighborhood character is addressed in two geographical areas: the project site and adjacent neighborhoods located within a ½-mile area from the boundaries of the project site. A larger secondary study area was not considered necessary for the neighborhood character analysis due to natural and man-made barriers (described below). The uses within the larger study area are too distant from the project site to contribute to the existing neighborhood character and would also not experience effects to neighborhood character as a result of the proposed project.

D. PRELIMINARY ASSESSMENT

DEFINING FEATURES

PROJECT SITE

The project site is composed of three discrete areas—the Special Willets Point District (the "District"), Willets West, and the South Lot and Lot D on Roosevelt Avenue—which are roughly bounded by Shea Road and Northern Boulevard to the north, the Van Wyck Expressway to the east, Roosevelt Avenue and the Metropolitan Transportation Authority (MTA) Corona Rail Yard to the south, and Shea Road to the west.

Special Willets Point District

The District portion of the project site comprises approximately 61 acres, approximately 15.8 acres of which are within public street rights-of-way, approximately 0.6 acres of which are owned by MTA, and the remainder of which is a mix of privately owned land and land owned by the City. It covers most of the Willets Point peninsula, which is itself defined by the Flushing River and Flushing Bay. In addition, the neighborhood is surrounded by a network of above-grade roadways, connectors and viaducts (including the Van Wyck Expressway, Northern Boulevard, and the elevated No. 7 subway line) that form a relatively hard-edged boundary. Auto-related services are the most prevalent use in the District. These services consist of auto-body repair, auto glass, car washes and auto detailing, used and new auto part sales, tire sales, and vehicle towing. There are also a number of car junkyards in the District, which support auto salvage businesses. The District also contains some industrial uses, including construction-related services and materials, and waste transfer and recycling. In addition to the auto-related and industrial uses, a few commercial uses exist in the District to cater to businesses in the area. These include a deli and grocery, and a restaurant. The District contains one institutional use, a private, members-only motorcycle club. Although residential uses are not permitted under the existing zoning, there is one residential unit in the District, located on Willets Point Boulevard.

The District is partially developed in a street grid, although due to the diagonal trajectory of Willets Point Boulevard and the curve of Northern Boulevard, the majority of the blocks are irregularly shaped. Willets Point Boulevard is the main thoroughfare through the District. Starting at 126th Street, it runs on a diagonal that extends northeast to the entrance of the Van Wyck Expressway. There are no streets south of Willets Point Boulevard in the District.

The streetscape of the District is industrial in character. Most of the streets are flanked by paved sidewalks, which are in poor condition and are also used for car parking, auto parts storage, and waste storage. The streets in the District also are in various states of disrepair. Most are partially paved and riddled with potholes. The only streets with designated or marked traffic lanes are 126th Street and Willets Point Boulevard. There are few sidewalk crossings or stop signs. Throughout the District, stormwater drainage is a serious problem, as the area lacks an adequate drainage system and much of the stormwater runoff flows as overland flow and ponds, causing area streets to flood during storm events.

The majority of structures in the District are generally small masonry or metal buildings, temporary metal sheds and Quonset huts, or brick buildings with small footprints. Exterior building materials include corrugated metal, concrete block, and brick. The majority of the buildings have large, projecting advertising signs. Most of the buildings in the District are attached or located close together. In contrast, in the northeast section of the District there are a number of freestanding buildings that are larger and boxier in form. These include the Tully Environmental and Crown Container site, which contains a three-story, boxy red brick building and is surrounded by a metal chain-link fence topped with barbed wire. Large trucks and other manufacturing equipment are stored on the site. Also located in the northeastern section of the District is the House of Spices distribution site, which contains an unornamented two-story, boxy concrete building, surrounded by a large paved area and smaller, one-story structures. Another notable building in this portion of the District is the historic former Empire Millwork Corporation Building (see Chapter 7, "Historic and Cultural Resources"). This two-story, Georgian Revival-style red brick building is located near the intersection of Willets Point Boulevard and the Van Wyck Expressway.

Willets Point Development

Existing uses and structures in the District are similar to the primarily industrial uses along the Flushing River and Flushing Bay waterfronts from the Whitestone Expressway to approximately 37th Avenue, but contrast sharply with most of the uses and types of development in the nearby communities, such as the higher-density commercial and residential development in Downtown Flushing, and the primarily low- to mid-density residential neighborhood of Corona to the west of CitiField and the Grand Central Parkway. Deteriorated sidewalks, large potholes, corrugated metal building façades, and the widespread use of streets and sidewalks for vehicle parking and storage for adjacent automotive uses contribute to an unappealing streetscape and create uninviting and unsafe pedestrian conditions. Despite its transit-oriented location and proximity to Downtown Flushing and several thriving neighborhoods, Willets Point contains virtually none of the land use characteristics or patterns of its neighbors.

Willets West

The Willets West portion of the project site comprises an approximately 30.7-acre section of the surface parking field adjacent to CitiField, the stadium for the New York Mets. While this portion of the project site is mapped as parkland in Flushing Meadows-Corona Park, it does not function as public open space. The property was first developed as a paved parking lot for the 1939–1940 World’s Fair. A 1943 map of the project site area shows it as a large, paved parking lot punctuated by asphalt islands and floodlights. It was occupied by Shea Stadium and associated parking and circulation space beginning in 1964, until it was replaced by CitiField in 2009, and it is now occupied exclusively by surface parking. The area is lit by tall floodlights and there are traffic islands within and around the perimeter of the surface parking area, which are currently planted with trees. There are no structures on this portion of the project site.

Roosevelt Avenue

The Roosevelt Avenue portion of the project site comprises CitiField-related surface parking lots (South Lot and Lots B and D) along Roosevelt Avenue. The South Lot and Lot D are located between Roosevelt Avenue and the MTA Corona Rail Yard, and are separated by the elevated Passerelle Ramp, which extends south from the Mets-Willets Point subway station and comes to grade adjacent to the USTA National Tennis Center. Lot B is located on the north side of Roosevelt Avenue, west of 126th Street; this paved surface parking lot currently serves as VIP/ADA parking for CitiField. These lots are also mapped as parkland, but are occupied exclusively by surface parking. Lot D and South Lot are used for commuter parking and United States Tennis Association (USTA) National Tennis Center (NTC) events when baseball games are not in progress. The parking areas each include a small number of trees at the site perimeter and are lit by tall floodlights. Lot B is surrounded by a decorative metal fence; the South Lot and Lot D are surrounded by chain link fencing. There are no structures on this portion of the project site, except for small temporary structures related to the parking use.

As described in Chapter 7, “Historic and Cultural Resources,” there are no known or potential architectural resources within the Willets West and Roosevelt Avenue portions of the project site. The 2008 FGEIS identified one architectural resource within the Special Willets Point District: the former Empire Millwork Corporation Building at 128-150 Willets Point Boulevard. It has a red brick front section, which faces onto Willets Point Boulevard, and a large, double-height, multi-paned glass section in the rear. As part of the 2008 FGEIS, the structure was determined S/NR-eligible by the New York State Office of Parks, Recreation & Historic Preservation (OPRHP) as a significant early 20th century commercial and industrial building.

As described in Chapter 8, “Urban Design and Visual Resources,” there are no visual resources within the District portion of the project site, nor are any visible from its sidewalks and streets. Views to the west are blocked by CitiField. Natural features surrounding the District, including those in Flushing Meadows-Corona Park, Flushing Bay, and the Flushing River, are not visually accessible primarily due to the elevated transportation structures to the north, south, and east of the District.

Overall, the project site has no natural features, and its topography is relatively flat. The project site is mostly isolated from the surrounding neighborhoods by several natural and man-made barriers. To the east of the Van Wyck Expressway lies the Flushing River, and beyond that, Downtown Flushing. To the north of Northern Boulevard lies Flushing Bay, with the industrial area of College Point on its northern shore. To the south of the project site are the LIRR tracks for the Port Washington Line, the MTA Corona Rail Yard, and the USTA NTC, and to the west is Grand Central Parkway and the Corona neighborhood.

ADJACENT AREAS

Nearby areas include other parts of the Willets Point peninsula that lie outside the Willets Point Development District, portions of Flushing Meadows-Corona Park, Downtown Flushing, the greater Flushing area, and portions of Corona. Directly east of the District is a large undeveloped MTA property located along the Flushing River waterfront, a majority of which is leased to Tully Environmental, Inc., which operates a construction and demolition debris recycling operation on the site. To the north of the District, across Northern Boulevard, is a New York City Department of Transportation (NYCDOT) maintenance and repair facility, and between Northern Boulevard and the Van Wyck Expressway is an asphalt plant. To the northwest of the District, across Northern Boulevard, is the Flushing Bay Promenade, which is within the boundary of Flushing Meadows-Corona Park and is described below. To the south of the District—south of Roosevelt Avenue, near the LIRR tracks—is the MTA Corona Rail Yard. The Corona Rail Yard, which is not part of Flushing Meadows-Corona Park, contains a storage area for subway cars as well as repair shops. The Casey Stengel Bus Depot is adjacent to the Corona Rail Yard. Taken together, the uses surrounding the District have an industrial character typical of transit infrastructure, manufacturing zones, and working waterfront uses. While they are the geographically closest sites to the District and contain uses compatible with those found in the District, aside from the MTA property these sites are all buffered from the District by intervening raised roadways and the elevated superstructure of the No.7 subway line.

Primarily to the south and west of the District is the portion of Flushing Meadows-Corona Park that extends from Flushing Bay to just south of the USTA NTC. This portion of the park includes CitiField and its surrounding parking fields. The elevated No. 7 subway line serves the primary study area, with the Mets-Willets Point station located adjacent to CitiField above Roosevelt Avenue. The LIRR also has a Mets-Willets Point station adjacent to the Corona Rail Yard, which operates on baseball game and USTA NTC event days. The Passerelle Ramp, which is for pedestrian use, spans the Yards and connects both stations to CitiField and the USTA NTC.

The USTA NTC contains three stadiums and is host to tennis events year-round, including the U.S. Open. The USTA NTC contains the 23,000-seat Arthur Ashe Stadium, 10,000-seat Louis Armstrong Stadium, a smaller 3,500-seat stadium, and 30 additional tennis courts. The courts are open during the year for tennis clinics and camps, as well as for general public use. There is a

Willets Point Development

small parking lot located adjacent to the USTA NTC; however, during the U.S. Open, CitiField lots are also used for parking.

East of the USTA NTC, the park contains a pitch and putt golf center, and a large area available for passive and active recreation, with trees, pathways, and sitting areas. West of the USTA NTC and the Grand Central Parkway, the park includes the New York Hall of Science. There is a large (500-space) parking lot adjacent to the museum. The Olmsted Center, located near the LIRR right-of-way immediately west of the USTA NTC, contains offices for the design and construction supervision divisions of DPR. The Passerelle Building, located under the Passerelle Ramp, contains offices and support facilities for the park. The Allied Building, located on the far-east side of the park south of Roosevelt Avenue and near the Van Wyck Expressway, contains DPR offices and storehouses.

Another part of the park near the project site is the Flushing Bay Promenade, which winds along Flushing Bay for approximately 1.4 miles from LaGuardia Airport to the Willets Point peninsula. The promenade contains many sitting areas and provides access to the World's Fair Marina and a restaurant located northeast of CitiField. There are more than 1,000 parking spaces located to the east and west of the marina, which are also available for parking on Mets game days.

In contrast to the underutilization that characterizes much of the District, east of the District and across Flushing River is the vibrant urban core of Downtown Flushing. Flushing is a thriving business and residential area, as well as a center for ethnic goods and culture. Downtown Flushing and the greater Flushing area contain a substantial Asian population, with large Chinese and Korean communities, and there are many specialty food and retail stores, restaurants, and other services that are utilized not only by the local population, but also serve as a destination for people living outside of the community. Downtown Flushing is also a regional transportation and commercial hub for Queens. While most of the commercial and cultural activity is centered along Northern Boulevard, Roosevelt Avenue, and Main Street, the Downtown Flushing study area (Flushing Subarea A) generally extends between the Flushing River to the west, Northern Boulevard to the north, Bowne Street to the east, and the LIRR tracks located south of Roosevelt Avenue to the south. The predominantly industrial areas in Flushing are generally located along the Flushing River within approximately ½ mile of the District, with some commercial and mixed-uses areas south of 37th Avenue. To the south of the LIRR Port Washington Line (Flushing Subarea B), industrial uses are concentrated west of College Point Boulevard. To the north of Northern Boulevard (Flushing Subarea C), a large industrial district extends east of the Flushing River to Linden Place.

The western portion of the study area includes the Corona subarea bounded by 114th Street to the east, 108th Street to the west, Grand Central Parkway to the north, and 44th Avenue to the south. This portion of the study area is predominantly residential in character and contains a variety of housing types, including detached one- and two-family residences on narrow lots, attached row-houses and multi-family dwelling units, and apartment buildings. Other prominent residential uses include the 301-unit Dorie Miller Cooperative housing development located on 114th Street between Northern Boulevard and 34th Avenue, and the 132-unit Meadow Manor housing development located at 113th Street and 34th Avenue. There is a mix of commercial uses and dense neighborhood retail and office uses along Northern Boulevard and Roosevelt Avenue. A few auto-related uses are located on Northern Boulevard, and some light manufacturing uses are located on 111th Street between Northern Boulevard and Astoria Boulevard, including a live chicken wholesale warehouse and storage warehouse. A construction

material distribution warehouse and a few auto-related uses are also located on Roosevelt Avenue. The right-of-way for the LIRR Port Washington Line forms the southern boundary of this subarea, and the Van Wyck Expressway forms the northern boundary. The No. 7 subway line, which is elevated above Roosevelt Avenue, has a station at 111th Street. Notable community facilities in this portion of Corona include the Louis Armstrong School (P.S. 143), Hinton Park, the New York Church of Christ, Mount Horeb Baptist Church, and the Child Center of New York day care center.

As described in Chapter 7, “Historic and Cultural Resources,” there are no known or potential architectural resources located within a 400-foot area surrounding the project site. Beyond the 400-foot historic resources study area, there are a number of known or potential architectural resources, primarily within the Flushing Subarea A, as well as those associated with the 1939–1940 and 1964–1965 World’s Fairs.

As described in Chapter 8, “Urban Design and Visual Resources,” there are a number of visual resources in or visible from the study area, including Flushing Bay and its promenade, Flushing Meadows-Corona Park, and the structures associated with the 1964 World’s Fair.

Noise conditions in the study area are typical of an urban neighborhood adjacent to elevated subway operations and well-trafficked roads. As described in greater detail in Chapter 17, “Noise,” most of the noise affecting the area is from vehicular traffic along area roadways and from the elevated No. 7 subway line that runs above Roosevelt Avenue. Airplane flights from nearby LaGuardia Airport also contribute to background noise levels. Overall noise levels are generally relatively high, and reflect the level of activity in the area.

The project site is within close proximity to primary highways including the Whitestone Expressway to the north and east, the Grand Central Parkway to the west, and the Long Island Expressway (LIE) to the south. This network of highway mainlines and ramp interchanges carries significant traffic volumes and frequently experiences congestion during peak travel periods. Sections of the local street network adjacent to the District, such as Roosevelt Avenue and Northern Boulevard, experience moderate to heavy traffic volumes during peak travel periods, while other sections, such as 126th Street, have substantial amounts of unused capacity during typical weekday and weekend conditions. In addition, the close proximity of the project sites to CitiField results in significant changes to traffic characteristics and operations on roadways in the area before and after Mets home games. With parking lot entrances located along Roosevelt Avenue, 126th Street, and Stadium Road, access and egress to CitiField during pre- and post-game periods significantly affects traffic conditions on both the highway and local street networks near Willets Point.

Overall, the study area has diverse characteristics and is not defined by one element. The project site is mostly isolated from the surrounding neighborhoods by several natural and man-made barriers. The District portion of the project site is predominantly characterized by auto-related services, with generally small masonry or metal buildings, temporary metal sheds and Quonset huts, or brick buildings with small footprints. Most of the sidewalks are in poor condition the streets in various states of disrepair. The Willets West and Roosevelt Avenue portions of the project site are characterized by surface parking lots. The eastern portion of the study area includes Downton Flushing, a thriving business and residential area, as well as a center for ethnic goods and culture. The western portion of the study area includes the Corona subarea which is predominantly residential in character and contains a variety of housing types, including detached one- and two-family residences on narrow lots, attached row-houses and multi-family dwelling units, and apartment buildings. Other defining uses in the study area

include those within the Flushing Meadows-Corona Park, including Citifield to the west of the District, USTA NTC in the southern portion of the study area, and the Flushing Bay Promenade, which winds along Flushing Bay. The study area is heavily trafficked, with noise levels that are relatively high, reflecting the level of vehicular activity on the adjacent streets, the elevated No. 7 subway line, and airplane flights from nearby LaGuardia Airport. No one defining feature would be considered critical to the character of the neighborhood. Rather, all the various localized features contribute to it.

POTENTIAL TO AFFECT DEFINING FEATURES OF A NEIGHBORHOOD

As mentioned above, significant adverse impacts from the proposed project have been identified in the areas of historic and cultural resources, and transportation.

In Phase 2 of the proposed project, it is anticipated that the former Empire Millwork Corporation Building would be demolished. However, as described in the 2008 FGEIS, for a number of reasons, the building does not meaningfully contribute to neighborhood character. Tucked into the northeast corner of the District, the building's primary façade is not visible from most of the District or from most parts of the study area due to the elevated Van Wyck Expressway—the primary views of the building's façade are when driving past it. The building is not particularly tall and therefore is not highly visible from either the District or the study area, and it is not a defining feature of a view corridor or a visual terminating point. As mentioned above, there are also a number of known or potential architectural resources outside of the project site, within the ½ mile study area. The proposed project would not result in any significant adverse impacts to these resources.

As discussed in detail in Chapter 14, "Traffic and Parking," by the full buildout in Phase 2, the proposed project is expected to have significant traffic impacts at 22 of the 31 intersections analyzed for the future With Action condition in the weekday AM peak hour, and 26 of 31 in the weekday midday, weekday PM and Saturday midday non-game peak hours. During the PM pre-game weekday peak hour, 25 of 31 intersections analyzed would have significant traffic impacts, and during the Saturday pre-game and post-game peak hours, 23 of 31 intersections analyzed would have significant impacts. Also by Phase 2, five of six highway mainline locations analyzed (including the westbound Grand Central Parkway, and both directions of the Whitestone and Van Wyck Expressways) and eight of the 12 ramp locations would be significantly impacted during at least one peak hour. However, traffic congestion in the study area would be present even without the proposed project, as the expected magnitude of background development in the No Action condition would generate substantial traffic volumes in the study area mostly along the primary streets in the study area network (including Northern Boulevard, Roosevelt Avenue, Astoria Boulevard, and College Point Boulevard). While the study area will be heavily trafficked, and the proposed project would generate traffic resulting in significant adverse traffic impacts, traffic conditions are not considered critical to the character of the neighborhood. In addition, significant adverse traffic impacts could be fully or partially mitigated at most of the impacted locations with signal timing adjustments and other measures, as described in Chapter 21, "Mitigation". Therefore, these impacts would not substantially affect the character of the neighborhood.

The proposed project would also result in significant adverse transit and pedestrian impacts. These were identified for the street-level stairways on the north side of Roosevelt Avenue at the Mets-Willets Point subway station, line-haul conditions on the No. 7 train, and the Q19, Q48, and Q66 bus routes. Significant pedestrian impacts were identified for the east crosswalk at the

intersection of Northern Boulevard and 126th Street, the north and west crosswalks at the intersection of Roosevelt Avenue and 126th Street, the north, south, and east crosswalks at the intersection of 34th Avenue and 126th Street, the south crosswalk at the intersection of New Willets Point Boulevard and 126th Street, and the north crosswalk at the newly signalized intersection of Roosevelt Avenue and the Lot B driveway. While these significant adverse impacts are predicted to occur, bus capacity and pedestrian conditions at sidewalk/crosswalk locations are not considered critical to the character of the neighborhood. In addition, the significant adverse transit and pedestrian impacts would be mitigated to the extent practicable, subject to approvals of NYCDOT and the MTA. Therefore, these impacts would not substantially affect the character of the neighborhood.

The transportation conditions and historic elements of the study area surrounding are generally unrelated, and therefore the proposed project's effects on these elements would not individually or in combination result in a significant adverse impact on neighborhood character.

In addition, as described above, the 2012 *CEQR Technical Manual* states that even if a project does not have the potential to result in a significant adverse impact in a certain technical area, the project may have the potential to result in a combination of moderate effects to several elements that cumulatively may affect neighborhood character. A moderate effect is generally defined as an effect considered reasonably close to the significant adverse impact threshold for a particular technical analysis area. The proposed project would not result in significant adverse impacts in the areas of land use, zoning, and public policy; socioeconomic conditions; open space; urban design and visual resources; shadows; or noise nor would it result in moderate effects in these areas as defined by CEQR guidelines. Therefore the proposed project would not have the potential to result in a combination of moderate effects to several elements that cumulatively may affect neighborhood character.

The proposed changes, while significant, would not have a significant adverse impact, but would rather result in an improvement in neighborhood character. As described in Chapter 1, "Project Description," the proposed project is intended to remediate and transform the area surrounding CitiField, which is largely separated from adjoining neighborhoods by major highways, into a thriving new neighborhood and regional destination. Consistent with the 2008 FGEIS, the proposed project represents a critical step in implementing the 2004 Downtown Flushing Development Framework, a land use and economic planning strategy for the growth of Downtown Flushing, the Flushing waterfront, and adjacent areas. The District would be developed pursuant to the zoning regulations approved in 2008, and the proposed project would advance a number of the Framework's fundamental goals, including the creation of a regional destination that would enhance economic growth in Downtown Flushing; improvement of environmental conditions; and integration of new development with surrounding amenities, including the Flushing Bay Promenade, CitiField, Flushing Meadows-Corona Park, and Downtown Flushing. The proposed project would be consistent with and vital to the advancement of several of the goals of PlaNYC, which aim to create a more sustainable New York by the year 2030.

By providing development spanning both sides of the new CitiField, the proposed project would allow for a more comprehensive and continuous neighborhood transformation linking Flushing and Corona. The environmental degradation of the Willets Point district would be remediated. The commercial components of the proposed project would complement the adjacent sports venue and strengthen economic activity in the neighborhood. The new structures and open spaces are intended to create an active streetscape enhancing the pedestrian experience. The

Willeys Point Development

proposed entertainment and retail destination of Willeys West would complement the anticipated development within the District, and both would connect Flushing to the east with Corona to the west through the creation of an unbroken series of uses along Roosevelt Avenue stretching from east of the Flushing River to west of the Grand Central Parkway. Over 2,000 units of affordable housing would be developed to accommodate a portion of the City's current and future affordable housing needs. The proposed project would represent a significant investment to improve the infrastructure of the project area. Raising the District portion of the project site out of the floodplain would not only minimize the potential loss of life, structures, and natural resources caused by flooding and erosion, but would also protect the new infrastructure investment. By eliminating flooding within the District and improving the quality of the soil substrate, the proposed project would also improve water quality in Flushing Bay. For all of the reasons described above, the proposed project would not result in a significant adverse impact on neighborhood character. *

A. INTRODUCTION

The construction analysis in this chapter updates changes to the proposed project and background conditions since the 2008 FGEIS and assesses whether any changed background conditions or differences in elements between the reasonable worst-case development scenario (RWCDS) and the program assessed in the 2008 FGEIS and subsequent technical memoranda would result in significant adverse construction impacts that were not addressed in the 2008 FGEIS or subsequent technical memoranda. This chapter summarizes the RWCDS and an associated conceptual construction scenario for the proposed project and considers the potential for adverse impacts during construction.

Construction activities, although temporary, can include noticeable and disruptive effects. Determination of the significance of construction impacts and need for mitigation is generally based on the duration and magnitude of the impacts. For construction activities of the scale and duration estimated for the proposed project, the 2012 *City Environmental Quality Review (CEQR) Technical Manual* calls for an assessment of construction-related impacts, with a focus on transportation, air quality, and noise, as well as consideration of other technical areas such as historic and cultural resources, hazardous materials, and open space. The assessment focuses on project construction activities within the project site.

The proposed project is expected to result in the development of new residential, retail, entertainment, community facility, office, convention center, school, structured and surface parking, and open space uses on the project site. Over a period of approximately 19 years, construction would occur as described in detail in Chapter 1, “Project Description,” on the three distinct portions of the project site—the approximately 61-acre “Willetts Point” portion of the project site (the Special Willetts Point District); the approximately 30.7-acre “Willetts West” portion of the project site (a section of the surface parking field west of CitiField); and the approximately 16.8-acre “Roosevelt Avenue” portions of the project site comprising three CitiField-related surface parking lots (South Lot and Lots B and D) along Roosevelt Avenue south and southwest of CitiField.

The proposed project would redevelop the Willetts Point/CitiField area with a mix of uses that is expected to be completed by 2032. The redevelopment would incorporate a development in the Special Willetts Point District substantially as anticipated and analyzed in the 2008 FGEIS and subsequent technical memoranda, as well as a major entertainment/retail component and parking adjacent to CitiField. For analysis purposes, a reasonable worst-case conceptual construction phasing and schedule for the development anticipated to occur under the proposed project was developed to illustrate how the proposed project could occur over approximately 19 years. Under the RWCDS conceptual construction phasing and schedule, construction of the proposed project is anticipated to proceed in the following three sequential phases: Phase 1A construction would commence at the start of 2014 and would last for about 4 years 10 months, with Phase 1A being completed before the end of 2018; Phase 1B construction would commence in mid-2022,

Willeys Point Development

lasting for about 6 years 1 month, with Phase 1B being completed in mid-2028; finally, it is anticipated that Phase 2 construction activities would begin at the end of 2026 and would last for about 6 years 1 month, with Phase 2 being completed at the end of 2032.

Given that the project's 19 building sites and other proposed area improvements are distributed over the approximately 108.9 acres of the project site, one or more building sites and other portions of the project site would be under construction during each of the three Phases (1A, 1B, and 2) for part or all of approximately 16 years, over the course of the approximately 19 year construction duration anticipated for the full "build out" of the proposed project. As construction activity associated with the proposed project would occur on multiple building sites and other locations within the same geographic area, there is the potential for several construction timelines to overlap.

The reasonable worst-case construction and phasing schedule conservatively accounts for overlapping construction activities and simultaneously operating construction equipment, thus capturing the cumulative nature of construction impacts which would result in the greatest impacts at nearby receptors. The reasonable worst-case conceptual construction phasing and schedule for the proposed project is described in this chapter, followed by the types of activities likely to occur during construction. An assessment of potential impacts of construction activity and the methods that may be employed to avoid or minimize the potential for significant adverse impacts are then presented.

For each of the various technical areas presented below, appropriate construction analysis years were selected to represent reasonable worst-case conditions relevant to that technical area, which can occur at different times for different analyses. For example, the noisiest part of the construction may not be at the same time as the heaviest construction traffic. Therefore, the analysis periods may differ for different analysis areas. Where appropriate, the analysis accounted for the effects of elements of the proposed project that would be completed and operational during the selected construction analysis years.

While the anticipated construction durations have been developed with an experienced New York City construction manager, the discussion is only illustrative as specific means and methods will be chosen at the time of construction. While the Phase 1A and 1B development programs are those being advanced by the developer team (Queens Development Group, LLC [QDG]) selected to undertake this portion of the proposed project, there are no finalized construction programs or designs for the Phase 1A and 1B elements of the proposed project at this time. Furthermore, as the Phase 2 development will be the subject of a future developer solicitation, the Phase 2 development program analyzed in this SEIS generally reflects the development anticipated for this area based on the development program approved in the 2008 FGEIS, as modified in the subsequent technical memoranda. The construction durations have been conservatively chosen to serve as the basis of the analyses in this chapter and are representative of the reasonable worst-case assumptions for determining potential construction period impacts. The conceptual schedule represents a conservative potential timeline for construction, which shows overlapping construction activities and simultaneously operating construction equipment during the three major construction phases, for the proposed project's 19 building sites and other planned project elements (i.e., new open spaces, public park, surface and structured parking, and/or infrastructure improvements) in proximity to one another. Thus, the analysis captures the cumulative nature of construction impacts, which would result in the greatest impacts at nearby receptors.

PRINCIPAL CONCLUSIONS

There would be temporary inconvenience and disruption arising from the construction of the proposed project throughout the Willets Point/CitiField area. As detailed below, construction of the proposed project would result in significant adverse construction impacts related to transportation and historic and cultural resources. Potential mitigation for these significant adverse impacts is discussed in Chapter 21, "Mitigation."

TRANSPORTATION

The construction of the proposed project, from 2014 to 2032, would generate construction worker and truck traffic. Because of the lengthy duration of these activities, an evaluation of construction sequencing and worker/truck projections was undertaken to assess the potential transportation-related impacts. It is expected that the project construction activities would yield considerably less traffic than that projected for the proposed project and that parking and staging needs could be managed primarily within the District, or next to the stadium (for Lot B construction). However, given the high traffic volume in the existing and No Action conditions, and the inclusion of traffic from the project as it is being built out as well as construction traffic, significant adverse traffic impacts could still occur at some of the study area locations during construction. Where impacts during construction may occur, measures recommended to mitigate impacts associated with the proposed project could be implemented early to aid in alleviating congested traffic conditions. At locations where the proposed project is expected to result in unmitigated significant adverse traffic impacts, these impacts could similarly exist during construction.

Construction worker transit trips would occur outside of peak periods of transit ridership and would be distributed and dispersed to the nearby transit facilities, and would not result in any significant adverse transit impacts. However, the significant adverse transit impacts disclosed for the 2032 With Action condition may also occur during peak construction in 2031. Similar mitigation measures as those identified for the 2032 With Action condition are expected to also address the potential transit impacts during construction. As with the 2028 and 2032 With Action conditions, the projected subway line-haul impact during the weekday AM peak period may remain unmitigated. ~~Additionally, as discussed in more detail in Chapter 14, "Transportation," and Chapter 21, "Mitigation," subway station impacts may remain unmitigated, if mitigation options are found to be infeasible, or if NYCT changes the current game day operation of the station.~~

Pedestrian trips during peak construction in 2031 would primarily be concentrated during off-peak hours (6 to 7 AM and 3 to 4 PM) and would be distributed among numerous pedestrian facilities in the area. Accordingly, there would also not be a potential for significant adverse pedestrian impacts attributable to the projected construction worker pedestrian trips. However, the significant adverse pedestrian impacts disclosed for the 2032 With Action condition may also occur during peak construction in 2031. Similar mitigation measures as those identified for the 2032 With Action condition are expected to also address the potential pedestrian impacts during construction. At locations where the proposed project is expected to result in unmitigated significant adverse pedestrian impacts, these impacts could similarly exist during construction.

AIR QUALITY

Based on a detailed analysis of construction during Phase 2 and a qualitative evaluation of construction during Phases 1A and 1B, the proposed project would not result in significant

adverse impacts with respect to air quality. A detailed analysis of the combined effects of on-site and on-road emissions, determined that annual-average nitrogen dioxide (NO₂), carbon monoxide (CO), ~~and particulate matter with an aerodynamic diameter less than 10 microns (PM₁₀), and particulate matter with an aerodynamic diameter of less than 2.5 microns (PM_{2.5})~~ concentrations would be below their corresponding National Ambient Air Quality Standards (NAAQS) or de minimis criteria. Therefore, the proposed projects would not cause or contribute to any significant adverse air quality impacts with respect to these standards. ~~Additional air quality studies may be undertaken between the Draft SEIS and Final SEIS to further refine the construction mobile source analysis for the Phase 2 analysis year, in consultation with DEP.~~

~~Dispersion modeling determined that the maximum predicted incremental concentrations of PM_{2.5} (using a worst case emissions scenario) would exceed the City's applicable 24 hour interim guidance criterion of 2 µg/m³ at a few receptor locations on the northeastern façade of parcel A1 during the construction activities at parcel A11 located immediately to the northeast, where the likelihood of prolonged exposure is very low. The maximum predicted incremental concentrations of PM_{2.5} would also exceed at a sidewalk location due to mobile sources on the southeast corner of 34th Avenue and 126th Street. The occurrences of elevated 24 hour average concentrations for PM_{2.5} would be limited in duration, frequency, and magnitude. Therefore, after taking into account the limited duration and extent of these predicted exceedances, and the limited area wide extent of the 24 hour impacts, it is concluded that no significant adverse air quality impacts for PM_{2.5} are expected from the on-site construction sources.~~

Because background concentrations are not known and the analysis methodology for mobile and construction sources have not been developed for the new 1-hour NO₂ NAAQS, exceedances of the 1-hour NO₂ standard resulting from construction activities cannot be ruled out. Therefore, measures including diesel equipment reduction, utilization of newer equipment, and source location and idling restriction, would be implemented by the proposed project to minimize NO_x emissions from construction activities.

NOISE AND VIBRATION

Based on a detailed analysis of construction during Phase 2 and a qualitative evaluation of construction during Phases 1A and 1B, construction activities would not be expected to result in significant noise impacts at any nearby sensitive receptor locations. Proposed buildings that would be completed and occupied before construction is completed at other project building sites would also experience exterior noise levels due to construction activities in the low 70s to mid-80s dBA range. The design of all project buildings would include building façades providing not less than 31-43 dBA of attenuation, and alternate means of ventilation (i.e., air conditioners) that do not degrade the acoustical performance of the façade. During the time period when these proposed buildings would be occupied and loud construction activities would be underway at immediately adjacent building sites (approximately two years according to the conceptual construction schedule on which the construction noise analysis is based), interior noise levels would, during some times, exceed 45 dBA L₁₀₍₁₎ (the CEQR acceptable interior noise level criteria for residential uses). Such exceedances may be intrusive, but would be only temporary and of limited duration. Consequently, they would not result in any significant impacts.

On-site, construction activities would produce L₁₀₍₁₎ noise levels at open space areas up to approximately the mid 70s dBA, which would exceed the levels recommended by CEQR for passive open spaces (55 dBA L₁₀). (Noise levels in these areas exceed CEQR recommended values for existing and No Action conditions.) While this is not desirable, there is no effective

practical mitigation¹ that could be implemented to avoid these levels during construction. Noise levels in many parks and open space areas throughout the city, which are located near heavily trafficked roadways and/or near construction sites, experience comparable and sometimes higher noise levels, and consequently such levels would not be considered a significant adverse impact.

OTHER TECHNICAL AREAS

Consistent with the 2008 FGEIS and subsequent technical memoranda, and as described in greater detail below, construction of the proposed project would not be expected to result in any significant adverse impacts to land use, socioeconomic conditions, community facilities, open space, or natural resources.

Consistent with the findings in the 2008 FGEIS, construction activities related to the development that would occur within the Special Willets Point District during Phase 2 of the proposed project would be anticipated to result in the demolition of the former Empire Millwork Corporation Building, which was found by the New York State Office of Parks, Recreation, and Historic Preservation (OPRHP) to be eligible for listing on the State and National Registers of Historic Places (S/NR). Demolition of this structure would be considered a significant adverse effect on this architectural resource.

As described in detail in Chapter 10, “Hazardous Materials,” and consistent with the conclusions of the 2008 FGEIS and subsequent technical memoranda, the proposed project would not result in significant adverse impacts related to hazardous materials during construction. To avoid the potential for significant adverse impacts related to hazardous materials, the proposed project would include appropriate health and safety (e.g., dust control and air monitoring) and investigative/remedial (e.g., delineating and excavating contaminated soils and disposing of them off site at an appropriately licensed facility) measures that would precede or govern both demolition and soil disturbance activities. These measures would be conducted in compliance with all applicable laws and regulations and would conform to appropriate engineering practices.

Construction would create major direct benefits resulting from expenditures on labor, materials, and services, and indirect benefits created by expenditures by material suppliers, construction workers, and other employees involved in the direct activity.

B. SUMMARY OF FINDINGS—2008 FGEIS AND SUBSEQUENT TECHNICAL MEMORANDA

The 2008 FGEIS concluded that because the Special Willets Point District is isolated from the surrounding neighborhoods, no significant adverse impacts related to land use, zoning, or public policy; neighborhood character; or community facilities were expected on the project site or study areas from construction of the Willets Point Development Plan. Subsequent technical memoranda also concluded that revisions to the Plan would not have resulted in significant adverse impacts on land use, zoning, or public policy; neighborhood character; or community facilities on the project site or study areas from construction of the Willets Point Development Plan.

The 2008 FGEIS concluded that the Willets Point Development Plan would have required the demolition of the former Empire Millwork Corporation Building, which was determined eligible for listing on the State and National Registers of Historic Places, and thus would have had a

¹ Noise barriers would not be practical because of security concerns.

Willets Point Development

significant adverse impact on historic resources. The 2008 FGEIS also concluded that the preparation and enforcement of a Health and Safety Plan (HASP) for the Willets Point Development Plan would have been expected to prevent any significant adverse impacts from hazardous materials.

The 2008 FGEIS concluded that the traffic from construction of the Willets Point Development Plan would have been substantially less than traffic generated by the full operation of the Plan at most intersections, with the exception of the intersection of College Point Boulevard at Roosevelt Avenue, 126th Street at Roosevelt Avenue, and 126th Street at ~~24th~~ 34th Avenue. These intersections would have experienced slightly higher traffic volumes due to limited availability of direct highway access to the District, as the new access ramps to/from the Van Wyck Expressway would not yet have been constructed. Impacts at the study locations could have been mitigated with the early implementation of measures discussed in the 2008 FGEIS. However, unmitigatable impacts would have ~~occurred~~ occurred at some of the same locations identified as having unmitigatable impacts during operation of the proposed Plan. Similarly, Technical Memorandum #3 concluded that although the traffic volumes associated with the construction peak for the Adjusted Plan would be lower than under the Approved Plan, significant adverse traffic impacts would still have ~~occurred~~ occurred and the same types of mitigation would have applied.

The 2008 FGEIS concluded that air pollutant emissions from construction equipment and trucks from the Willets Point Development Plan would have been reduced to the extent practicable by the enforcement of Local Law 77 of 2005, which required all City-sponsored construction to reduce construction-related emissions of diesel particulate matter (DPM) by using the best available technology (BAT) to control emissions, and which applied to the 2008 project, and other additional measures listed below. The construction control measures committed to in the FGEIS addressed both the emissions levels, and the location of sources relative to such receptor locations, so as to ensure that significant impacts on air quality during construction would not have occurred. For the Adjusted Plan, Technical Memorandum #3 concluded that the same measures to control air emissions would have been implemented.

The 2008 FGEIS concluded that the Willets Point Development Plan would not have resulted in any long-term significant adverse noise impacts that would have been expected from construction activities. While increases in noise levels exceeding the CEQR impact criteria for a shorter period of time (less than the two consecutive year CEQR threshold) may be noisy and intrusive, they are not considered to be significant adverse noise impacts. The District is large, and much of it is well-removed from any sensitive receptor. In addition, little night work was expected, and any exceedances of the CEQR criteria at sensitive locations would have ~~occurred~~ occurred during the day. For the Adjusted Plan, Technical Memorandum #3 concluded that the same measures to control noise would have been implemented.

Technical Memorandum #4 found that the schedule change with the Updated Plan would not have resulted in any significant adverse construction impacts that were not previously disclosed in the FGEIS or the subsequent technical memoranda. Technical Memorandum #4 assumed a buffer area within the district between the area to be redeveloped and the surrounding areas. This buffer would not be included in the proposed project, and the absence of the buffer would not have the potential to result in any additional significant adverse construction impacts not found in the 2008 FGEIS as described in the analysis below.

C. ANALYSIS APPROACH

The construction analysis presented in this chapter considers the potential impacts of construction activities anticipated to occur throughout the project site as a result of the proposed project. As discussed in Chapter 1, “Project Description,” as part of the reasonable worst-case development scenario (RWCDs), this SEIS also analyzes the potential future development of parking, retail and office uses on Lot B, a portion of the CitiField leasehold along Roosevelt Avenue. For the purposes of the RWCDs, it is assumed that this development would be completed by 2032, and therefore has been included in this assessment. Additionally, while not part of the proposed project, the construction of the new Van Wyck Expressway access ramps—which was anticipated in the 2008 FGEIS and for which the City has received approval from the Federal Highway Administration—and is now slated to be completed in 2024, is also considered in the construction analyses presented in the chapter.

D. METHODOLOGY

This section discusses the level of analysis used to assess the potential for significant adverse impacts in each of the construction-related analysis areas presented in the *CEQR Technical Manual*. For each of the various technical areas presented below, appropriate construction analysis years were selected (as necessary) to represent reasonable worst-case conditions relevant to that technical area, which can occur at different times for different analyses. For example, the noisiest part of the construction may not be at the same time as the heaviest construction traffic. Therefore, the analysis periods may differ for traffic, air quality, and noise. In each section, the methodologies to determine the period of reasonable worst-case conditions for assessing potential impacts are explained. All methodologies used in the impact analyses are in accordance with the *CEQR Technical Manual*. For all construction-related analysis areas, the methodologies used to assess potential construction-related impacts can be found in the chapters for each analysis area addressing potential operational impacts. Additional details relevant only to the construction air quality and noise analysis methodologies are given in their respective analysis sections below.

For the purposes of the construction analyses performed in this SEIS, in the future without the proposed project, the project site is expected to continue to be occupied by existing uses for Phase 1A. For Phase 1B, the Phase 1A uses previously constructed are assumed to be occupied, and the remainder of the Phase 1B portion of the project site is assumed to have been cleared during the demolition and remediation activities that are to take place during Phase 1A. For Phase 2, all of the Phase 1A development is assumed to be completed and occupied, and as Phase 2 commences, most of the Phase 1B development is assumed to be completed and subsequently occupied according to the construction schedule for Phase 1B presented in the next section of this chapter. In addition, the Phase 2 development area is assumed to remain with its existing uses on that portion of the project site until construction of Phase 2 commences.

The next section in this chapter describes the conceptual construction schedule, the construction methods to be used, and city, state, and federal regulations and policies that govern construction. This section also establishes the framework used for the assessment of potential impacts from construction. The construction timeline—determined by the timing of the various major construction stages associated with constructing a building, such as excavation and foundation, core and shell construction, and interior finishing—is described. The types of equipment are discussed, and the number of workers and truck deliveries estimated. The analyses use these data to determine the potential for significant adverse environmental impacts.

E. CONSTRUCTION PHASING AND ACTIVITIES

INTRODUCTION

This section of the chapter first gives an overview of the anticipated conceptual construction phasing and schedule for the proposed project, and then provides a detailed description of each type of major construction activity and the types of equipment typically associated with each. The major construction activities discussed include: abatement and demolition; site preparation and utilities; excavation and foundations; construction of the core and shell of the building; exterior cladding; interior fit-out; and site work, finishing, and open space construction. General construction practices are then presented, including those associated with deliveries and access, hours of work, and sidewalk and lane closures. Finally, the estimated number of workers and truck deliveries for project construction are presented.

CONCEPTUAL CONSTRUCTION PHASING AND SCHEDULE

While the anticipated construction durations described below have been developed with an experienced New York City construction manager (and are commonly used in New York City), the discussion is only illustrative as means and methods may be chosen at the time of construction. The Phase 1A and 1B development programs are those being advanced by QDG selected to undertake this portion of the proposed project; there are no finalized construction programs or designs for the Phase 1A and 1B elements of the proposed project at this time. Furthermore, as the Phase 2 development will be the subject of a future developer solicitation, the Phase 2 development program analyzed in this SEIS generally reflects the development anticipated for this area based on the development program approved in the 2008 FGEIS, as modified in the subsequent technical memoranda.

The described means, methods, and construction durations are conservatively chosen and are representative of the reasonable worst-case for potential impacts. The analyses also account for overlapping construction activities during each phase of construction at the various building sites in proximity to one another to capture the cumulative nature of construction impacts with respect to numbers of workers, trucks, and non-road engines on site at the various building sites within the project site at any given time, within reasonable construction scheduling constraints for the proposed project. The conceptual construction schedule conservatively identifies the first quarter of 2031 (during Phase 2) as the period of peak construction activity as well as the peak for cumulative effects, because it accounts for the cumulative effects of overlapping operational activities (from previously completed phases and building completed earlier in Phase 2) and ongoing construction activities for the proposed project as well as for nearby no build projects, most notably the construction of the development on Lot B assumed as part of the RWCDS.

In this SEIS, the construction of the proposed project is analyzed in three overall phases, which generally represent construction on a portion of the Special Willets Point District, the Willets West site, and the South Lot (Phase 1A), followed by construction on a portion of the District and the remainder of the South Lot and Lot D (Phase 1B), and ending with construction on the remaining portions of the District (Phase 2), and Lot B. Complete build-out of the various project elements and the 19 building sites within the overall project site would occur in the following three distinct sequential phases: Phase 1A would commence at the beginning of 2014 and last for about 4 years 10 months, and be completed before the end of 2018; Phase 1B would commence in mid-2022, last for about 6 years 1 month, and be completed in mid-2028; and Phase 2 would begin at the end of 2026, last for about 6 years 1 month, and be completed at the

end of 2032. If the proposed project is not built, it is expected that the project site would remain in its current condition.

Figures 20-1 through 20-3 graphically depict the conceptual construction sequencing and schedule for the various components of the proposed project's Phase 1A, Phase 1B, and Phase 2 development, respectively. **Figure 20-4** visually represents the overall conceptual construction sequence for the entire construction duration of the proposed project. **Table 20-1** presents the overall conceptual construction sequencing and schedule for the proposed project, by phase and specific development site.

PHASE 1A

Phase 1A involves construction of a hotel and two retail buildings, temporary surface parking, and temporary recreational areas on 11 parcels within the Special Willets Point District (Parcels A1–A11), the entertainment and retail center and associated structured parking west of CitiField on the Willets West site, and structured parking on the western portion of the South Lot, south of Roosevelt Avenue.

Phase 1A site preparation activities are expected to start in the District during the first quarter of 2014, on the site of the interim surface parking east of 126th Street. For the two years between the start of 2014 and the end of 2015, construction activities would be focused on preparing the site for construction of buildings, including the abatement and demolition of existing structures, followed by remedial action work, site grading and fill, installation of utilities, and surface improvements. This would be followed by construction of the hotel and retail developments east of 126th Street on Parcels A3 and A4, beginning in January 2016. These buildings would take about 22 months to complete, with construction of these buildings ending in the 4th quarter of 2017. Construction of the entertainment and retail center west of 126th Street on the Willets West site would begin during the second quarter of 2015, and would continue for about 29 months, finishing in the fourth quarter of 2018. The structured parking garage on the western portion of the South Lot, south of Roosevelt Avenue, would commence construction during the second quarter of 2017, and would continue for about 14 months, being completed by the end of the second quarter of 2018. Finally, the remaining site work and utilities installation, and associated surface improvements would commence during the first quarter of 2018, lasting for about 9 months, and would be completed in the last quarter of 2018. All Phase 1A construction would be anticipated to be completed by the fourth quarter of 2018, with construction of the entertainment and retail center and associated parking structures on the Willets West site and the final site work on parcels in the District being completed last.

PHASE 1B

Phase 1B involves construction of several mixed use buildings and permanent and temporary public and private open spaces on 10 parcels within the District (Parcels A1-A5, and A7-A11), as well as structured parking on the eastern portion of the South Lot and Lot D, south of Roosevelt Avenue.

Anticipated Construction Schedule (Phase 1A)
Figure 20-1

NOTE: * = The Van Wyck Access Roads/Ramps is not part of the proposed project, but has been accounted for in the construction analyses; therefore, it is included here to show its relationship to the proposed project.

Anticipated Construction Schedule (Phase 1B)
Figure 20-2

NOTE: * = Lot B Development is not part of the proposed project, but has been accounted for in the construction analyses; therefore, it is included here to show its relationship to the proposed project.

Anticipated Construction Schedule (Phase 2)
Figure 20-3

Table 20-1
Conceptual Construction Schedule

Construction Task	Start Month	Finish Month	Approximate duration (months)
Phase 1A			
Area-wide Site Work/Surface Parking East of 126th Street: Demolition, Abatement, and Remediation, and Fill, Grading, and Utility Activities	January 2014	December 2015	24
Hotel & Retail East of 126th Street (Building Parcels 3A & 4A)	January 2016	October 2017	22
Entertainment/Retail Center & Structured Parking, West of 126th Street (Willets West)	June 2016	October 2018	29
Structured Parking Garage (South of Roosevelt Avenue in the South Lot)	May 2017	June 2018	14
Western Site Work and Utilities/Surface Improvements	February 2018	October 2018	9
Phase 1B			
Structured Parking Garages (South of Roosevelt Avenue - South Lot/Lot D)	June 2022	July 2023	14
Area-wide Site Work: Demolition, Site Preparation, Fill, Grading, and Utility/Infrastructure Activities	July 2023	February 2025	20
Parcel A1 (Office/Residential/Retail)	December 2023	June 2026	31
Parcel A2 (Hotel/Office/Retail/Community)	June 2024	September 2026	28
Parcel A3 (Residential)	December 2024	October 2026	23
Parcel A4 (Residential)	May 2025	May 2027	25
Parcel A5 (Residential/Retail)	August 2025	March 2027	20
Parcel A7 (Temporary Open Space)	January 2027	February 2028	14
Parcel A8 (Residential/School)	November 2025	February 2028	28
Parcel A9 (Residential/Retail)	March 2026	April 2028	26
Parcel A10 (Residential/Retail)	August 2026	June 2028	23
Parcel A11 (Temporary Open Space)	January 2027	February 2028	14
Van Wyck Access Roads/Ramps*	July 2022	December 2024	30
Phase 2			
Area-wide Site Work: Demolition, Abatement and Remediation, Site Preparation, Fill, Grading, and Utility/Infrastructure Activities	December 2026	August 2029	33
Parcel A5 (Residential/Retail)	January 2028	November 2029	23
Parcel A16 (Public Park)	January 2028	February 2029	14
Parcel A6 (School/Hotel/Retail/Community)	May 2028	May 2030	25
Parcel A7 (Residential/Retail)	August 2028	June 2030	23
Parcel A11 (Residential/Retail)	November 2028	November 2030	25
Parcel A12 (Residential)	March 2029	April 2031	26
Parcel A13 (Residential)	July 2029	August 2031	26
Parcel A19 (Convention Center)	August 2029	August 2032	37
Parcel A14 (Residential)	December 2029	January 2032	26
Parcel A15 (Residential)	May 2030	April 2032	24
Parcel A17 (Residential)	August 2030	August 2032	25
Parcel A18 (Residential)	December 2030	October 2032	23
Parcels A20-23 (Open Space)	January 2031	February 2032	14
Lot B Development (Mixed Use)*	April 2030	February 2032	23
Notes: Start date is the first day of the month. Finish date is last day of the month. *The Van Wyck Access Roads/Ramps and Lot B development are not part of the proposed project, but have been accounted for in the construction analyses, as described above. Source: Hunter Roberts Construction Group and QDG.			

Phase 1B construction would begin with the construction of the structured parking garages south of Roosevelt Avenue in the second quarter of 2022. Construction of the garages would take about 14 months, with completion anticipated in the third quarter of 2023. Similar to Phase 1A, Phase 1B would involve extensive site preparation, demolition, abatement, fill, and utility and infrastructure

activities on the parcels to be developed during this phase (excluding Parcels A3 and A4, which were prepared during Phase 1A). These activities would commence in the third quarter of 2023; extending for about 20 months, and would be complete in the first quarter of 2025. Construction of the buildings on Parcel A1 would begin in the fourth quarter of 2023 and take about 31 months to complete. Construction of the buildings on Parcel A2 would take about 28 months, beginning in the second quarter of 2024. The buildings on Parcel A3 would commence construction during the fourth quarter of 2024, and would be completed in about 23 months. Construction of the buildings on Parcel A4 would take about 25 months, beginning in the second quarter of 2025. The building on the southern portion of Parcel A5 would commence construction during the third quarter of 2025, and would be completed in about 20 months. Construction of the buildings on Parcel A8 (including the school) would take about 28 months, beginning in the fourth quarter of 2025. The buildings on Parcel A9 would commence construction during the first quarter of 2026, and would be completed in about 26 months. Construction of the buildings on Parcel A10 would take about 23 months, beginning in the third quarter of 2026. Finally, the construction of the temporary open spaces on Parcels A7 and A11 would both commence in January 2027, and would each take about 14 months to complete, finishing in the first quarter of 2028. All Phase 1B construction would be anticipated to be completed by the middle of 2028, with construction of the buildings on Parcel A10, being completed last.

As mentioned previously, while not part of the proposed project, the construction of the new Van Wyck Expressway access ramps—which was anticipated in the 2008 FGEIS and for which the City has received approval from the Federal Highway Administration—is also considered in this construction analyses. This infrastructure improvement would also be completed within the Phase 1B timeframe, over approximately two years, starting in the third quarter of 2022 and ending in the fourth quarter of 2024. Phase 1B buildings within the District would not be occupied until after the completion of the Van Wyck Expressway improvements.

PHASE 2

Phase 2 involves construction of several mixed use buildings and permanent public and private open spaces on 16 parcels within the District (Parcels A5-A7 and A11-A23), as well as the mixed use development assumed as part of the RWCDS on Lot B, west of 126th Street, between CitiField and Roosevelt Avenue.

Similar to Phase 1B, Phase 2 would involve extensive site preparation, demolition, fill, and utility and infrastructure activities on the parcels in the District to be developed during this phase. These construction activities would commence in the fourth quarter of 2026; extending for about 33 months, and would be complete in the third quarter of 2029. Construction of the Phase 2 buildings and open spaces would then begin in January of 2028, with the simultaneous construction of the new public park (on Parcel A16) and the building on the northern portion of Parcel A5. The park would take about 14 months to build, while the building on Parcel A5 would take about 23 months to complete. Construction of the buildings (including the school) on Parcel A6 would begin in the second quarter of 2028, and take about 25 months to complete. Construction of the building on Parcel A7 would take about 23 months, beginning in the third quarter of 2028. The buildings on Parcel A11 would commence construction during the fourth quarter of 2028, and would be completed in about 25 months. Construction of the buildings on Parcel A12 would take about 26 months, beginning in the first quarter of 2029. The buildings on Parcel A13 would commence construction during the third quarter of 2029, and would be completed in about 26 months. The convention center on Parcel A19 would commence construction during the third quarter of 2029. This building would take the longest to construct, and would be completed in about 37 months, in the third quarter of 2032. Construction of the buildings on Parcel A14 would take about 26 months, beginning in the fourth quarter of 2029.

Willets Point Development

Construction of the buildings on Parcel A15 would take about 24 months, beginning in the second quarter of 2030. Construction of the building on Parcel A17 would begin in the third quarter of 2030, and is expected to take about 25 months to complete. The building on Parcel A18 would commence construction during the fourth quarter of 2030, and would be completed in about 23 months. Finally, the construction of the permanent open spaces on Parcels A20-A23 would commence in January 2031, and would collectively take about 14 months to complete, finishing in the first quarter of 2032. All Phase 2 construction would be anticipated to be completed by the fourth quarter of 2032, with construction of the buildings on Parcel A18, being completed last.

While the potential future development on Lot B is not part of the proposed program, and no specific development plans have been proposed, for the purposes of a conservative analysis, a conceptual program for Lot B has been analyzed as part of the RWCDs. Construction of the development on Lot B has been conservatively assumed to commence in the second quarter of 2030, and is anticipated to take about 23 months to construct.

During construction of the proposed project, the highest number of workers and trucks would both be expected to occur in the first quarter of 2031. These peak construction activities during the early part of 2031 reflect the anticipated concurrent construction at seven development parcels in the District (Parcels A12-A15, and A17-A19—which includes the convention center), in addition to overlapping construction of the permanent open spaces on Parcels A20-A23, and the assumed construction of the development on Lot B, south of CitiField, with many of these individual construction sites undergoing labor intensive overlapping construction stages (building core, shell, and finishing) simultaneously during that quarter.

CONSTRUCTION DESCRIPTION

OVERVIEW

Construction of mid-rise or large-scale buildings in New York City typically follows a general pattern. The first task is construction startup, which involves the siting of work trailers, installation of temporary power and communication lines, and the erection of site perimeter fencing. Then, if there is an existing building on the site, any potential hazardous materials (such as asbestos) are abated, and the building is demolished with some of the materials recycled and the debris taken to a licensed disposal facility. For sites requiring new or upgraded public utility connections, these activities are undertaken next (e.g., electrical connections, and installation of new water or sewer lines and hook-ups, etc.). Excavation and removal and/or addition and re-grading of the soils is the next step, followed by construction of building foundations. Specific to this project, as each development phase has several building sites or parcels that will have construction ongoing over the course of each phase, many of the initial site activities will be undertaken for the entire portion of the project site to be developed under the phase all at one time, as described previously. Once the areawide site preparation activities are completed, construction of individual building foundations commences. When the below-grade construction is completed, construction of the core and shell of the new building begins. The core is the central part of the building and is the main part of the structural system. It contains the elevators and the mechanical systems for heating, ventilation, and air conditioning (HVAC). The shell is the outside of the building. As the core and floor decks of the building are being erected, installation of the mechanical and electrical internal networks would start. As the building progresses upward, the exterior cladding is placed, and the interior fit out begins. During the busiest time of building construction, the upper core and structure are built while the mechanical/electrical connections, exterior cladding, and interior finishing progress on lower floors. Finally, site work, including landscaping, and other site work

associated with a particular building site, or in some instances the entire project area being developed during a particular phase, like completing or resurfacing new roadways and sidewalks is undertaken, and individual building or areawide development area site access and protection measures required during construction are removed.

GENERAL CONSTRUCTION PRACTICES

Certain activities would be ongoing throughout the construction period for the proposed project. For the areas in Phases 1A and 1B which are to be developed by QDG, there would be a field representative designated to serve as the contact point for the community and local leaders. The representative would be available to meet and work with the community to resolve concerns or problems that arise during the construction process. This is a fairly standard practice for the construction of large buildings or large-scale area developments in New York City, and it is anticipated that the ultimate developers of the project area for Phase 2, as well as for Lot B, and the Van Wyck access improvements would also designate field representatives to serve as contact points for the community with respect to construction on that site, when it is under construction.

Governmental Coordination and Oversight

The following describes governmental construction oversight agencies and typical construction practices in New York City. In certain instances, specific practices may vary from those described below. However, the typical practices are expected to be used because they have been developed over many years and have been found to be necessary to successfully complete large projects in a confined urban area.

The governmental oversight of construction in New York City is extensive and involves a number of city, state, and federal agencies. **Table 20-2** shows the main agencies involved in construction oversight and the agency's areas of responsibilities. The primary responsibilities lie with New York City agencies. The New York City Department of Buildings (DOB) has the primary responsibility for ensuring that the construction meets the requirements of the Building Code and that the building is structurally, electrically, and mechanically safe. In addition, DOB enforces safety regulations to protect both the workers and the public. The areas of responsibility include installation and operation of the equipment, such as cranes and lifts, sidewalk shed, and safety netting and scaffolding. The New York City Department of Environmental Protection (DEP) enforces the Noise Code and regulates water disposal into the sewer system. The New York City Fire Department (FDNY) has primary oversight for compliance with the Fire Code and for the installation of tanks containing flammable materials. The New York City Department of Transportation (NYCDOT) reviews and approves any traffic lane and sidewalk closures. New York City Transit (NYCT) is responsible for subway access and, if necessary, bus stop relocations. NYCT also coordinates construction work which could affect the subway system. The New York City Landmarks Preservation Commission (LPC) approves studies and testing to prevent loss of archaeological materials and approves the construction protection plan (CPP) used when the construction is in proximity to historic structures. The New York City Department of Parks and Recreation (DPR) is responsible for the oversight, enforcement, and permitting of the replacement of street trees that are lost due to construction. Section 5-102 et. seq. of the Laws of the City of New York requires a permit to remove any trees and the replacement of the trees as determined by calculating the size, condition, species, and location rating of the tree proposed for removal. New York City maintains a 24-hour-a-day telephone hotline (311) so that concerns can be registered with the city.

Table 20-2
Construction Oversight in New York City

Agency	Areas of Responsibility
New York City:	
Department of Buildings	Primary oversight for Building Code and site safety
Department of Environmental Protection	Noise, hazardous materials, dewatering
Department of Environmental Protection and/or Office of Environmental Remediation	<u>Remedial Action Plans (RAPs)/Construction Health and Safety Plans (CHASPs)</u>
Fire Department	Compliance with Fire Code, tank operation
Department of Transportation	Lane and sidewalk closures
New York City Transit	Subway access, bus stop relocation
Department of Parks & Recreation	Street trees
Landmarks Preservation Commission	Archaeological and architectural resources protection
New York State:	
Department of Labor	Asbestos workers
Department of Environmental Conservation	Dewatering, hazardous materials, tanks, Stormwater Pollution Prevention Plan, Industrial SPDES, if any discharge into the Hudson River
United States:	
Environmental Protection Agency	Air emissions, noise, hazardous materials, toxic substances
Occupational Safety and Health Administration	Worker safety

The New York State Department of Environmental Conservation (NYSDEC) regulates discharge of water into rivers and streams, disposal of hazardous materials, and construction, operation, and removal of bulk petroleum and chemical storage tanks. The New York State Department of Labor (DOL) licenses asbestos workers. On the federal level, the Environmental Protection Agency (EPA) has wide ranging authority over environmental matters, including air emissions, noise, hazardous materials, and the use of poisons. Much of the responsibility is delegated to the state level. The Occupational Safety and Health Administration (OSHA) sets standards for work site safety and the construction equipment.

Deliveries and Access

Although the construction on the project site in the various phases will occupy large tracts of land, because of the numbers of trucks and workers, as well as the volume of materials that will be delivered to the site at any given time, specific construction staging and truck marshaling and laydown areas will be designated during each phase of construction to allow for an orderly and safe working environment at the project site. All deliveries, material removals, and hoist uses have to be tightly scheduled to maintain an orderly work area and to keep the construction on schedule and within budget.

Access to the various construction sites of the proposed project would be controlled. The work areas would be fenced off, and limited access points for workers and trucks would be provided. Private worker vehicles would not be allowed into the construction area. Security guards and flaggers may be posted as necessary, and all persons and trucks would have to pass through security points. Workers or trucks without a need to be on the site would not be allowed entry. After work hours, the gates would be closed and locked. Security guards may patrol the construction sites after work hours and over the weekends to prevent unauthorized access.

Material deliveries to the site would be controlled and scheduled. Unscheduled or haphazard deliveries would be minimized. To aid in adhering to the delivery schedules, as is normal for building construction in New York City, flaggers would be employed at each of the gates. The

flaggers could be supplied by the subcontractor on-site at that time or by the construction manager. The flaggers would control trucks entering and exiting the site, so that they would not interfere with one another. In addition, they would provide an additional traffic aid as the trucks enter and exit the on-street traffic streams.

Hours of Work

Construction activities for the proposed project's various building sites and other project elements would take place in accordance with New York City laws and regulations, which allow construction activities to take place between 7 AM and 6 PM. Construction work would begin at 7 AM on weekdays, with most workers arriving between 6 AM and 7 AM. Typically, work would end at 3:30 PM, but could be extended until 6 PM for such tasks as finishing a concrete pour for a pad, or completing the bolting of a steel frame erected that day. Extended workday activities would not include all construction workers on site, but only those involved in the specific task. Extended workdays would be most likely to occur during foundation and superstructure tasks, and limited extended workdays could occur during other tasks over the course of construction, but would likely be minimized.

At limited times over the course of constructing a building, weekend work could be required to make up for weather delays or other unforeseen circumstances. In such cases, the numbers of workers and pieces of equipment in operation would be limited to those needed to complete the particular authorized task. Therefore, the level of activity for any weekend work would be less than a normal workday. Weekend work requires a permit from DOB and, in certain instances, approval of a noise mitigation plan from the DEP under the City's Noise Code. The New York City Noise Control Code, as amended in December 2005 and effective July 1, 2007, limits construction (other than special circumstances as described below) to weekdays between the hours of 7 AM and 6 PM, and sets noise limits for certain specific pieces of construction equipment. Construction activities occurring after hours (weekdays between 6 PM and 7 AM and on weekends) may be permitted only to accommodate: (1) emergency conditions; (2) public safety; (3) construction projects by or on behalf of City agencies; (4) construction activities with minimal noise impacts; and (5) undue hardship resulting from unique site characteristics, unforeseen conditions, scheduling conflicts, and/or financial considerations. In such cases, the numbers of workers and pieces of equipment in operation would be limited to those needed to complete the particular authorized task. Therefore, the level of activity for any weekend work would be less than a normal workday. If it were to become necessary, the typical weekend workday would be on Saturday, beginning with worker arrival and site preparation at 7 AM, and ending with site cleanup at 5 PM.

A few tasks may have to be completed without interruption, and the work can extend past 6 PM. In certain situations, concrete must be poured continuously to form one structure without joints. This type of concrete pour is usually associated with foundations and structural slabs at grade, which could require a minimum of 12 hours or more to complete, depending on the size of the area being poured.

Sidewalk and Lane Closures

During the course of construction, traffic lanes and sidewalks would be closed or protected for varying periods of time. Truck movements would be spread throughout the day and would generally occur between the hours of 6:00 AM and 3:00 PM, depending on the stage of construction. No rerouting of traffic is anticipated and moving lanes of traffic are expected to be available at all times. Some street lanes and sidewalks could be continuously closed, and some

lanes and sidewalks would be closed only intermittently to allow for certain construction activities. For construction at the various building sites, any necessary sidewalk and lane closures would maintain pedestrian flow throughout the construction period for each site, and would generally not divert pedestrians to the other side of the street. Pedestrian circulation and access would be maintained through the use of protected sidewalk enclosures, temporary sidewalks or sidewalk bridges. NYCDOT would be consulted to determine the appropriate protective measures for ensuring pedestrian safety surrounding the various building sites; this work would be coordinated with and approved by NYCDOT.

GENERAL CONSTRUCTION TASKS

Abatement, Demolition, Remediation, and Grading

The proposed project would result in the extensive demolition of surface parking and/or loading areas and existing buildings on the project site. As indicated in **Figures 20-1 through 20-3** (see above), all project site-wide demolition activities required for the proposed project during each phase have been assumed would be undertaken at one time, and would be anticipated to last for between 20 and 33 months, depending on the phase of construction (see **Table 20-1**). These areas would be abated of asbestos and any other hazardous materials within the existing buildings and structures, where applicable.

A New York City-certified asbestos investigator would inspect the buildings for asbestos-containing materials (ACMs), and those materials must be removed by a NYCDOL-licensed asbestos abatement contractor prior to interior demolition. Asbestos abatement is strictly regulated by DEP, NYCDOL, EPA, and OSHA to protect the health and safety of construction workers and nearby residents and workers. Depending on the extent and type of ACMs, these agencies would be notified of the asbestos removal project and may inspect the abatement site to ensure that work is being performed in accordance with applicable regulations, including the new February 2, 2011 DEP regulations. These regulations specify abatement methods, including wet removal of ACMs that minimize asbestos fibers from becoming airborne, and containment measures. The areas of the building with ACMs would be isolated from the surrounding area with a containment system and a decontamination system. The types of these systems would depend on the type and quantity of ACMs, and may include hard barriers, isolation barriers, critical barriers, and caution tape. Specially trained and certified workers, wearing personal protective equipment, would remove the ACMs and place them in bags or containers lined with plastic sheeting for disposal at an asbestos-permitted landfill. Depending on the extent and type of ACMs, an independent third-party air-monitoring firm would collect air samples before, during, and after the asbestos abatement. These samples would be analyzed in a laboratory to ensure that regulated fiber levels are not exceeded. After the abatement is completed and the work areas have passed a visual inspection and monitoring, if applicable, the general demolition work can begin.

Any activities with the potential to disturb lead-based paint would be performed in accordance with the applicable OSHA regulation (OSHA 29 CFR 1926.62—*Lead Exposure in Construction*). When conducting demolition (unlike lead abatement work), lead-based paint is generally not stripped from surfaces. Structures may be disassembled or broken apart with most paint still intact. Dust control measures (spraying with water) would be used if necessary. The lead content of any resulting dust is therefore expected to be low. Work zone air monitoring for lead may be performed during certain activities with a high potential for releasing airborne lead-containing particulates in the immediate work zone, such as manual demolition of walls with

lead paint or cutting of steel with lead-containing coatings. Such monitoring would be performed to ensure that workers performing these activities are properly protected against lead exposure.

Any suspected PCB-containing equipment (such as fluorescent light ballasts) that would be disturbed would be evaluated prior to disturbance. Unless labeling or test data indicate that the suspected PCB-containing equipment does not contain PCBs, it would be assumed to contain PCBs and removed and disposed of at properly licensed facilities in accordance with all applicable regulatory requirements.

All of these procedures related to the handling of ACM, lead-based paint, and potential PCB-containing equipment would be contained in the DEP-approved CHASP.

General demolition is the next step, where necessary. Demolition would occur in accordance with DOB guidelines/requirements. In general, the first step is to remove any economically salvageable materials. Then the building is deconstructed using large equipment. Typical demolition requires fencing around the building to prevent accidental dispersal of building materials into areas accessible to the general public. The demolition debris would be sorted prior to being disposed at landfills to maximize recycling opportunities.

The project site is within the Federal Emergency Management Agency (FEMA) 100-year floodplain, and thus in some locations, particularly within the District, new fill would be required to grade and raise the project site structures above the 100-year floodplain level, consistent with the New York City Building Code. Changes to the grade elevation are expected to occur in phases. During Phase 1A the majority of the project site will remain at the existing grade and only the hotel and commercial spaces would be built at a higher grade above the floodplain elevation. The remainder of the extent of Phase 1A and 1B would be raised above the floodplain elevation prior to completion of the development of Phase 1B in 2028. Those grade changes will either occur through new fill and retaining walls or by building atop basements that raise the finished floor height above the floodplain elevation. Grade transitions would be created between the new streets in Phase 1B and the existing street grades that would remain in the Phase 2 area until that area is raised prior to completion of Phase 2 development in 2032.

For the general remediation, demolition, and site grading activities necessary for the proposed project, it is estimated that there would be approximately 59, 71, and 148 workers per day on-site during Phase 1A, Phase 1B and Phase 2, respectively, with a peak of up to about 420 workers per day during Phase 2. Typically approximately 12, 6, and 29 truckloads of debris would be removed per day from the project site during Phase 1A, Phase 1B and Phase 2, respectively, with a peak of up to about 58 trucks per day during Phase 2. The general abatement, remediation, and demolition phase is expected to last approximately two to three months at any given occupied parcel, with the project site-wide demolition activities anticipated lasting between approximately 20 and 33 months, depending on the phase of construction (see **Table 20-1**).

Site Preparation and Utilities—Construction Startup Tasks

The following tasks are considered to be typical startup work to prepare a site for construction. The tasks could include, but are not limited to, the following items. The means and methods and order of completion of these tasks could change as necessary. Startup work generally involves the installation of public safety measures, such as fencing, sidewalk sheds, and Jersey barriers. The site is fenced off, typically with solid fencing to minimize interference between the persons passing by the site and the construction work. Separate gates for workers and for trucks are installed, and sidewalk shed and Jersey barriers are erected. Trailers for the construction engineers and managers

are hauled to the site and installed. These trailers could be placed within the fence line, in the curb lane, or over the sidewalk sheds. Also, portable toilets, dumpsters for trash, and water and fuel tankers are brought to the site and installed. Temporary utilities are connected to the construction trailers. During the startup period, permanent utility connections may be made, especially if the contractor has obtained early electric power for construction use, but utility connections may be made almost any time during the construction sequence.

In addition to the new public infrastructure, the proposed project may need to relocate existing public infrastructure, particularly water and sewer connections, as well as electric, gas, and telephone lines that will be required for the project. Because the development areas will be cleared for each phase in anticipation of construction, it is assumed that there would be no existing uses in the Phase 1A/1B areas while those areas are under construction. Similarly, for Phase 2 construction, that area is also assumed to be clear, with no existing uses on that portion of the project site during Phase 2 construction. Some services (e.g., sanitary sewers) are currently not available in the District; however, during construction of Phase 1A/1B, the services that are currently available in the Phase 2 area (e.g., telephone, electric, water) will be maintained until the construction of that phase.

Installation of new or upgraded utilities would occur during this stage, and are anticipated to take an average of 3 months at each individual building site. However, as with site preparation activities, some of the more involved installation of new infrastructure elements would occur on an areawide basis. For the areawide installation of new utilities and infrastructure, it is estimated that there would be approximately 59, 71, and 272 workers per day on-site during Phase 1A, Phase 1B and Phase 2, respectively. Typically approximately 12, 6, and 29 truckloads of material would be delivered or debris would be removed per day from the project site during Phase 1A, Phase 1B and Phase 2, respectively. The general areawide installation of new utilities and infrastructure phase are anticipated to last between approximately 9 and 13 months, depending on the phase of construction.

New utility connections for any given building can be made at any time during the construction process. The initial investigatory work often occurs early during excavation and foundations, with the actual connections typically occurring once the building mechanical, electrical and plumbing systems are installed.

Sanitary Sewer System

The proposed project would include the development of a sanitary sewer system that would provide a new sanitary collection service to the area and eliminate the existing septic systems. Nearby areas, such as CitiField, direct their sanitary sewage to the 37th Avenue pump station. However, sewage from the Phase 2 construction may require upgrades to this pump station to increase its capacity. New sanitary collection lines within the District would be connected to the City sewer system that conveys sanitary sewage to the Bowery Bay Water Pollution Control Plant (WPCP) for treatment.

Sewer construction work primarily is a “cut-and-cover” technique. A trench would be excavated in the street, and short piles may need to be driven through the bottom of the trench. Concrete cradles would be installed to hold the sewer pipe. The sewer pipe would be installed in short lengths and connected. The trench would then be backfilled and the pavement replaced. While the new sewers are being constructed, temporary flumes may have to be installed to handle the existing sewer flows. DEP regularly performs this task at sites throughout the City. About 20 to 40 workers would be needed to install the sewer line and to control traffic for any portions that

are installed in public streets. Typical equipment includes backhoes, cranes, and front-end loaders. Trucks bring the sewer pipes to the construction, and depending on the suitability of the soil for re-use, trucks may be needed to cart off existing soils and bring suitable soil to the construction site.

In terms of the new utilities and infrastructure that will be required for the proposed project, the following describes the necessary new utilities by Phase (for more detailed discussion and description, please see Chapter 11, “Infrastructure”). The construction of these project elements has been taken into consideration in the construction estimates developed for each phase of the proposed project, and the effects of construction of these project elements are included in the various analyses.

Phase 1A

New 12-inch water mains in 35th Avenue, 126th Street, 127th Street, and Willets Point Boulevard would be constructed. For Willets West, a new on-site water loop would be required to tie into existing water main in Roosevelt Avenue. Sanitary sewer infrastructure, either existing or being built by the New York City Economic Development Corporation (EDC), would be adequate to accommodate the Phase 1A development. As a part of the proposed project, the 16-inch sanitary sewer connection would be extended south along 126th Street. In addition, a 7.5-foot by 5-foot box storm sewer currently under construction by EDC would be extended south along 126th Street as part of the proposed project to accommodate Phase 1A development within the District. No additional infrastructure would be anticipated to be required to support Willets West and the other sites during this phase.

Phase 1B

Consultation with DEP would be required to determine if upgrades (including a new regulator and connection) to the 72-inch water main in Willets Point Boulevard would be required to support the Phase 1B development. As assumed in the 2008 FGEIS, the existing 72-inch water main within Willets Point Boulevard would remain in place and a permanent easement, mapped on the City map, would be provided to enable acceptable access to this water main. Upgrades to the 37th Avenue pump station and its force main would likely be required for Phase 1B development. Verification of this requirement by DEP will be obtained prior to Phase 1B development. Stormwater and sanitary sewer infrastructure constructed as part of Phase 1A will be sized in accordance with the amended drainage plan (ADP), which would be required to be developed by QDG and would include anticipated flows associated with Phase 1B and Phase 2 development.

Phase 2

For the District, consultation with DEP would be required to determine water supply requirements for Phase 2 of the proposed project. At a minimum, DEP water mains would be required in 34th Avenue, 127th Street, and Willets Point Boulevard; these water mains would be extensions of the mains constructed in Phase 1A. Additional internal water service would likely be required to support the proposed development in 2032. Additionally, consultation with DEP would be required to determine if upgrades (including a new regulator and connection) to the 72-inch water main in Willets Point Boulevard would be required to support the Phase 2 development, if not already constructed in a prior phase. For all other sites, water service would remain as constructed.

For the District, new sanitary sewer trunk mains would be required in Northern Boulevard, 34th Avenue, 126th Street, 127th Street, Willets Point Boulevard, and Roosevelt Avenue. These sewers would be sized in accordance with the ADP that would be developed. Upgrades to the

Willets Point Development

37th Avenue pump station and its force main would likely be required for Phase 2 development. Verification of this requirement by DEP will be obtained prior to Phase 2 development. Upgrades to the 37th Avenue pump station and its force main would be required for Phase 2 development, if not already constructed in a prior phase.

For the District, new storm sewers would be required in Northern Boulevard, 34th Avenue, Willets Point Boulevard, and Roosevelt Avenue. These sewers would be sized in accordance with the ADP developed for Phase 2. In addition, a 60-inch outfall would be required in 127th Street for Phase 2.

All other existing utilities in the streets within the project site have sufficient capacity to support the development anticipated as a result of the proposed project. Connections to new buildings would be made from the existing utility lines.

Excavation and Foundation

Soil excavation, supplementation, re-grading, and foundation construction for the various building sites anticipated to be constructed as part of the proposed project has been estimated to take anywhere from 5 to 12 months to complete for buildings in Phase 1A; from 5 to 10 months to complete for buildings in Phase 1B (with an average of around 7.6 months); and anywhere from 5 to 12 months to complete for buildings in Phase 2 (with an average of around 7.6 months), with the exception of the convention center, which would take approximately 13 months (see **Figures 20-1** through **20-3**, for Phases 1A, 1B, and 2, respectively).

Excavators would be used for the task of digging foundations. Any excavated soil to be removed from the project site would be loaded onto dump trucks for transport to a licensed disposal facility. Foundation work could include pile driving and pouring concrete footings and foundation. The excavation/foundation task could involve the use of excavators, cranes, pile drivers, concrete pumps, concrete trucks, generators, and hand tools.

During construction of the Phase 1A buildings, anywhere from 20 to 128 workers would be on-site at each building site, at any given time, with a corresponding number of about 1 to 25 trucks per day are expected at any given building site. During construction of the Phase 1B buildings, anywhere from 38 to 116 workers would be on-site at each building site, at any given time, with a corresponding number of about 3 to 8 trucks per day are expected at any given building site. During construction of the Phase 2 buildings, anywhere from 25 to 121 workers would be on-site at each building site, at any given time, with a corresponding number of about 3 to 12 trucks per day are expected at any given building site.

Below-Grade Hazardous Materials

All construction subsurface soil disturbances would be performed in accordance with an DEP-approved RAP and CHASP. At a minimum, the RAP would provide for the appropriate handling, stockpiling, testing, transportation, and disposal of excavated materials, as well as any unexpectedly encountered tanks, in accordance with all applicable federal, state, and local regulatory requirements. The RAP would also provide for vapor control measures such as vapor barriers, as deemed necessary. The CHASP would ensure that all subsurface disturbances are done in a manner protective of workers, the community, and the environment.

Dewatering

The excavated area at any given site could be subject to accumulating groundwater until the slab-on-grade and/or above-grade portions of buildings are built. In addition to groundwater, rain and snow could collect in the excavation, and that water would have to be removed. If

necessary, the water would be pretreated prior to discharge. The decanted water would then be discharged into the New York City sewer system. Discharge in the sewer system is governed by DEP regulations.

DEP has a formal procedure for issuing a Letter of Approval to discharge into the New York City sewer system. The authorization is issued by the DEP borough office if the discharge is less than 10,000 gallons per day; an additional approval by the Division of Connections & Permitting is needed if the discharge is more than 10,000 gallons per day. All chemical and physical testing of the water has to be done by a laboratory that is certified by the New York State Department of Health (DOH). The design of the pretreatment system has to be signed by a New York State Professional Engineer or Registered Architect. For water discharged into New York City sewers, DEP regulations specify the following maximum concentration of pollutants.

• Petroleum hydrocarbons	50 parts per million (ppm)
• Cadmium	2 ppm
• Hexavalent chromium	5 ppm
• Copper	5 ppm
• Amenable cyanide	0.2 ppm
• Lead	2 ppm
• Mercury	0.05 ppm
• Nickel	3 ppm
• Zinc	5 ppm
• pH	between 5 to 12
• Temperature	less than 150 degrees Fahrenheit (F)
• Flash Point	greater than 140 degrees F
• Benzene	134 parts per billion (ppb)
• Ethylbenzene	380 ppb
• Methyl-Tert-Butyl-Ether (MTBE)	50 ppb
• Naphthalene	47 ppb
• Tetrachloroethylene (perc)	20 ppb
• Toluene	74 ppb
• Xylenes	74 ppb
• PCB	1 ppb
• Total Suspended Solids	350 ppm

Any groundwater discharged in the New York City system would meet these limits. DEP can also impose project-specific limits, depending on the location of the project and contamination that has been found in nearby areas.

Core and Shell

In general, core (superstructure) and shell (exterior fit out) construction of the various buildings anticipated to be constructed as part of the proposed project would depend on the size and type of the building being constructed. For the buildings being constructed in Phase 1A, core and shell construction would be expected to last approximately 7 to 18 months, depending on the size of the building. Phase 1B core and shell construction for the buildings proposed during this phase would be expected to take approximately 11 to 13 months, depending on the size of the building. For the buildings being constructed in Phase 2, depending on the size of the building, core and shell construction would be expected to last approximately 8 to 12 months, with the

convention center taking about 18 months. Construction of the interior structure, or core, of the buildings would include elevator shafts; vertical risers for mechanical, electrical, and plumbing systems; electrical and mechanical equipment rooms; core stairs; and restroom areas. This phase of work would also include construction of the building's framework (installation of beams and columns), and floor decks. Exterior construction involves the installation of the façade (exterior walls, windows, and cladding) and the roof. Cranes would be used to lift the façade into place, and welding machines and impact wrenches would secure the exterior to the superstructure. These activities would require the use of cranes, delivery trucks, concrete pumps, concrete trowels, welding equipment, and a variety of handheld tools. Temporary construction elevators (hoists) would also be constructed for the delivery of materials and vertical movement of workers during this stage where necessary.

During the core and shell construction of the Phase 1A buildings, anywhere from 54 to 346 workers would be on-site at each building site, at any given time, with a corresponding number of about 1 to 14 trucks per day are expected at any given building site. Core and shell construction would require anywhere from 98 to 382 workers would be on-site at each building site, at any given time, with a corresponding number of about 2 to 14 trucks per day are expected at any given building site, during construction of the Phase 1B buildings. During the core and shell construction of the Phase 2 buildings, anywhere from 98 to 258 workers would be on-site at each building site, at any given time, with a corresponding number of about 3 to 7 trucks per day are expected at any given building site.

Interior Fit-Out

This stage of construction would include the construction of interior partitions, installation of lighting fixtures, interior finishes (flooring, painting, etc.), and mechanical (e.g., installation of elevators) electrical, and plumbing (MEP) work. Mechanical and other interior work at each building would overlap with the building core and shell construction for between 4 and 15 months, partly depending on the size and type of building being constructed. On average the core/shell and interior/MEP work at the various project buildings would overlap for between 8 and 11 months, the largest buildings would have an overlap of up to 15 months. The interior fit-out and MEP work activities would employ a similar number of construction workers as the core and shell work, but would generally have greater numbers of trucks. During MEP and interior construction of the Phase 1A buildings, anywhere from 48 to 349 workers would be on-site at each building site, at any given time, with a corresponding number of about 5 to 25 trucks per day are expected at any given building site. Interior fit-out and MEP work would require anywhere from 64 to 321 workers would be on-site at each building site, at any given time, with a corresponding number of about 5 to 34 trucks per day are expected at any given building site, during construction of the Phase 1B buildings. The interior fit-out and MEP construction of the Phase 2 buildings would have anywhere from 64 to 232 workers on-site at each building at any given time, with a corresponding number of about 5 to 21 trucks per day are expected at any given building site. Equipment used during interior construction would include hoists, delivery trucks, and a variety of small hand-held tools. However, this stage of construction is the quietest, and does not generate fugitive dust.

Site Work and Finishing

This stage of construction would include the final finishing of the building and grounds, including landscaping activities. This is also when the construction protection measures (fencing, sidewalk enclosures, bridges, or temporary sidewalk, remaining scaffolding, etc.)

around the building sites would be removed. This activity would employ the least number of construction workers: with about 5 to 10 workers per day at each building site. In addition, minimal daily truck deliveries would be expected at each building during this stage of construction, with most days having no deliveries. Equipment used during this stage of construction would include hoists, delivery trucks, and a variety of small hand-held tools.

Open Space Areas and Other Surfaces

During construction of the publicly accessible open spaces, top soil may be imported for installation of the grassy areas and landscaping. Concrete sidewalks would be poured, and street furniture, such as benches and tables, would be installed. Dump trucks would bring the soil to the site for spreading by hand. Trees with about a 3- to 4-inch caliper (diameter) and shrubs would be planted. For the active recreation areas, the ground surfaces would be installed, followed by the appropriate amenities (e.g., basketball hoops, volleyball nets, etc.). The majority of this work would be done by hand. For the construction of the open spaces, this phase would require an average of about 45 workers for the construction of the temporary open spaces; about 54 workers for the construction of the new public park on Parcel A16, and about 75 workers for the construction of the open spaces on Parcels A20-A22. For the construction of the open spaces, this phase would require an average of about 3 daily truck deliveries for the construction of the temporary and permanent open spaces and park. Construction of the temporary and permanent open spaces and park are each anticipated to last for about 14 months at each location.

Access Road and Van Wyck Expressway Ramps

A new access ramp from the northbound Van Wyck Expressway would be constructed off the existing Exit 13 ramp and would connect to the new street network within the District at the northeast corner. A new ramp to the southbound Van Wyck Expressway would connect the northeast corner of the District to the expressway mainline immediately south of the interchange with the Whitestone Expressway. The ramps would start at grade and rise on columns to the height of the elevated expressway.

To build the ramps, foundations would be excavated and built for the columns, which could be steel or concrete. Lines of columns would be installed and connected with steel girders. The roadway would be built on the girders. Typically, excavators would be used and the foundations formed by concrete. Cranes would be used to place the columns and girders. Cranes would also be used to place the plates on which the roadway is built. At any given time, up to 50 workers could be engaged in building the ramps and access roads. The number of truck deliveries would be expected to average about 25 trucks per day throughout the majority of the construction of the access road and ramps.

NUMBER OF CONSTRUCTION WORKERS AND MATERIAL DELIVERIES

Construction is labor intensive, and the number of workers varies with the general construction task and the size of the building. Likewise, material deliveries generate many truck trips, and the number also varies. **Table 20-3** shows the estimated numbers of workers and deliveries to the project area by calendar quarter for all construction of the proposed project, regardless of construction Phase. The numbers shown in the table below conservatively include construction of the development on Lot B as well as the construction of the Van Wyck access improvements.

Table 20-3
Average Number of Daily Workers and Trucks by Quarter

Year	2014				2015				2016				2017			
Quarter	1st	2nd	3rd	4th	1st	2nd	3rd	4th	1st	2nd	3rd	4th	1st	2nd	3rd	4th
Workers	59	59	59	59	59	59	59	59	20	116	345	638	770	767	835	1,036
Trucks	12	12	12	12	12	12	12	12	1	9	30	47	63	72	71	56
Year	2018				2019				2020				2021

Notes:	Construction assumed to begin in January of 2014.															
Sources:	Hunter Roberts Construction Group and AKRF, Inc.															

The average number of workers would be about 838 per day throughout the construction period. The peak average number of workers would be 2,200 per day in the first quarter of 2031. For truck trips, the average number of trucks would be 58 per day, and the peak average would occur in the second quarter of 2031 with 128 trucks per day (the first quarter of 2031 would have just one less average truck trip per day during that quarter, compared with the peak quarter for trucking activity). Detailed workforce and delivery projections can be found in **Appendix E**.

F. THE FUTURE WITHOUT THE PROPOSED PROJECT

For the purposes of this SEIS, the no action condition generally assumes that the proposed project is not built, and the project site would continue to be occupied by existing uses, and other known background projects in the area, along with specified background growth will have occurred (e.g., traffic analysis). However, for some analysis areas, including air quality and noise, the future without the proposed project includes the completed phases of the project in the background conditions for those analyses. The only changes to the project site that are assumed would be the infrastructure improvements that are currently under construction, related to sewers and stormwater outfalls. Additionally, the construction of the new Van Wyck Expressway access ramps—which was anticipated in the 2008 FGEIS and for which the City has received approval from the Federal Highway Administration—which are slated to be completed in 2024 are also assumed to be in place by that time.

G. PROBABLE IMPACTS OF THE PROPOSED PROJECT

Similar to many large development projects in New York City, construction can be disruptive to the surrounding area for periods of time. While the anticipated construction durations for the proposed project have been developed with an experienced New York City construction manager, the discussion is only illustrative as specific means and methods will be chosen at the time of construction. While the Phase 1A and 1B development programs are those being

advanced by QDG selected to undertake this portion of the proposed project, there are no finalized construction programs or designs for the Phase 1A and 1B elements of the proposed project at this time. Furthermore, as the Phase 2 development will be the subject of a future developer solicitation, the Phase 2 development program analyzed in this SEIS generally reflects the development anticipated for this area based on the development program approved in the 2008 FGEIS, as modified in the subsequent technical memoranda. The construction durations have been conservatively chosen to serve as the basis of the analyses in this chapter and are representative of the reasonable worst-case assumptions for determining potential construction period impacts. The proposed project's conceptual schedule represents a conservative potential timeline for construction, which shows overlapping construction activities and simultaneously operating construction equipment for the proposed project's 19 building sites and other planned project elements (i.e., new park and open spaces, the proposed surface and structured parking, and/or infrastructure improvements) in proximity to one another. Thus, the analysis captures the cumulative nature of construction impacts, which would result in the greatest impacts at nearby receptors.

The following analyses describe the potential impacts that could result from construction of the proposed project, with respect to transportation, air quality, noise and vibration, historic and cultural resources, hazardous materials, open space, socioeconomic conditions, community facilities, natural resources, land use, and rodent control.

TRANSPORTATION

TRAFFIC

The proposed project would be developed in three sequential phases, from 2014 to 2032, and would generate construction worker and truck traffic. Because of the lengthy duration of these activities, an evaluation of construction sequencing and worker/truck projections was undertaken to identify the construction-related peak hour trip-making activities and to assess the potential transportation-related impacts. As described above, it is expected that parking and staging needs would be managed at each construction site and available areas adjacent to CitiField and within the District.

During the construction of Phase 1A, peak construction activities were projected to take place in the fourth quarter of 2017. By this time, only a small portion of the Phase 1A development program would be completed. **Table 20-4** provides a comparison of the cumulative construction and operational trips projected for peak Phase 1A construction to what would be realized upon the full build-out of Phase 1A. During the construction of Phase 1B, peak construction activities were projected to take place in the first quarter of 2027. By this time, the Phase 1A development program would have been in operation along with portions of the Phase 1B development components. **Table 20-5** provides a comparison of the cumulative construction and operational trips projected for peak Phase 1B construction to what would be realized upon the full build-out of Phase 1B. During the construction of Phase 2, peak construction activities were projected to take place in the first quarter of 2031. By this time, the Phase 1A and Phase B development program would have been in operation along with portions of the Phase 2 development components. **Table 20-6** provides a comparison of the cumulative construction and operational trips projected for peak Phase 2 construction to what would be realized upon the full build-out of Phase 2, or the entire proposed project. As demonstrated by these comparisons, the cumulative project-generated trips would be less than what would be realized upon the build-out of each of

the respective development phases. Therefore, the overall extent of potential traffic impacts during peak construction would be within the envelope of significant adverse traffic impacts identified for the With Action condition in Chapter 14, “Transportation.” For a reasonable worst-case assessment of potential construction traffic impacts, the discussion below focuses on the overall peak construction condition, which as identified above, would take place during the construction of Phase 2 of the proposed project in the first quarter of 2031.

Construction Trip generation

Average daily construction worker and truck activities by quarter were projected for the entire construction period. Construction is anticipated to begin in the first quarter of 2014 and be completed by the end of 2032. Construction worker and truck trip projections were refined to account for worker modal splits and vehicle occupancy, arrival and departure distribution, and passenger car equivalent (PCE) factors for construction truck traffic.¹ These estimates are presented in **Table 20-7**.

Daily Workforce and Truck Deliveries

For a reasonable worst-case analysis of potential transportation-related impacts during construction, the daily workforce and truck trip projections in the peak quarter were used as the basis for estimating peak hour construction trips. Based on a schedule of commencing construction in the beginning of 2014, the combined construction worker and truck traffic peak would occur in the first quarter of 2031. The daily average numbers of construction workers and truck deliveries during this construction peak quarter were estimated at 2,200 workers and 127 truck deliveries per day (see **Appendix E** for details). By the first quarter of 2031, Phase 1A and 1B of the proposed project and the first four buildings of Phase 2 would be completed and would also generate operational traffic. This operational traffic is combined with the construction traffic to assess the worst-case traffic impacts during this period. Estimates of construction activities are further discussed below.

Construction Worker Modal Splits and Vehicle Occupancy

Similar to the FGEIS, approximately 70 percent of construction workers would be expected to travel to the sites by private autos at an average occupancy of 1.15 persons per vehicle. The remaining 30 percent would use public transit.

Peak Hour Construction Worker Vehicle and Truck Trips

Construction activities would mostly take place during the typical construction shift of 7:00 AM to 3:30 PM. While construction truck trips would be made throughout the day (with more trips made during the early morning), most trucks would remain in the area for short durations and construction workers would typically commute during the hours before and after the work shift. For analysis purposes, each worker vehicle was assumed to arrive in the morning and depart in the afternoon or early evening, whereas each truck delivery was assumed to result in two truck trips during the same hour (one “in” and one “out”). Furthermore, in accordance with the 2012 *CEQR Technical Manual*, the traffic analysis assumed that each truck has a PCE of 2.0.

¹ The traffic analysis assumed that each truck has a PCE of 2.0.

4 PM - 5 PM	117	124	150	128	153	172	160	194	201	196	145	114	85	44	31	15				
5 PM - 6 PM	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0				
Daily Total	1,880	2,014	2,404	2,110	2,466	2,782	2,576	3,056	3,190	3,134	2,388	1,890	1,464	786	536	248				

The estimated daily vehicle trips were distributed throughout the workday based on projected work shift allocations and conventional arrival/departure patterns of construction workers and trucks. For construction workers, the majority (approximately 80 percent) of the arrival and departure trips would take place during the hour before and after each shift. For construction trucks, deliveries would occur throughout the day when the construction site is active. Construction truck deliveries typically peak during the early morning (approximately 25 percent), overlapping with construction worker arrival traffic. The peak construction hourly trip projections are summarized in **Table 20-8**.

Table 20-8
Peak Construction Vehicle Trip Projections

Hour	Auto Trips			Truck Trips			Total					
	Regular Shift			Regular Shift			Vehicle Trips			PCE Trips		
	In	Out	Total	In	Out	Total	In	Out	Total	In	Out	Total
Weekday (1st Quarter of 2031)												
6 AM - 7 AM	1,071	0	1,071	32	32	64	1,103	32	1,135	1,135	64	1,199
7 AM - 8 AM	268	0	268	13	13	26	281	13	294	294	26	320
8 AM - 9 AM	0	0	0	13	13	26	13	13	26	26	26	52
9 AM - 10 AM	0	0	0	13	13	26	13	13	26	26	26	52
10 AM - 11 AM	0	0	0	13	13	26	13	13	26	26	26	52

4 PM - 5 PM	0	201	201	0	0	0	0	201	201	0	201	201
Daily Total	1,339	1,339	2,678	128	128	256	1,467	1,467	2,934	1,595	1,595	3,190
Notes: Hourly construction worker and truck trips were derived from an estimated quarterly average number of construction workers and truck deliveries per day, with each truck delivery resulting in two daily trips (arrival and departure). Construction peak hours are shaded in this table.												

The projected construction activities in the first quarter of 2031 would result in 1,199 PCEs between 6 and 7 AM and 1,095 PCEs between 3 and 4 PM on weekdays. Since Phase 1A/1B and some components of Phase 2 of the proposed project would have already been completed and occupied, operational traffic generated by those completed components together with the projected construction traffic were considered for the construction traffic impact analysis. The analysis results are presented below.

Construction Traffic Capacity Analysis

Vehicles generated by construction activities were assigned to the street network, and eight key intersections for analysis were identified. These intersections are the same intersections addressed in the FGEIS. These intersections were analyzed from 6-7 AM and 3-4 PM, which correspond to the hours of peak vehicular traffic generated by construction plus operational traffic during the first quarter of 2031. Construction is not expected to take place on any game days or Saturdays. The key study intersections include:

- 126th Street and Northern Boulevard
- 126th Street at 34th Avenue
- 114th Street at Roosevelt Avenue
- 126th Street at Roosevelt Avenue
- College Point Boulevard at Roosevelt Avenue
- College Point Boulevard at the Northern Boulevard service road
- Boat Basin Road at World's Fair Marina

- 126th Street at New Willets Point Boulevard

The operations at these intersections were analyzed using the Highway Capacity Software (HCS+) version 5.5, which is based on the methodologies presented in the *2000 Highway Capacity Manual (HCM)*. A discussion of the analysis methodology can be found in Chapter 14, “Transportation.”

Construction Peak Traffic Volumes and Conditions

The AM peak hour of construction was selected to be 6-7 AM as the number of projected construction trips are significantly higher (1,135 vehicles) compared to the number of construction trips generated (approximately 26 vehicles) during the proposed project weekday non-game AM peak hour of 8-9 AM. The ATR volume comparison showed that 6-7 AM construction peak traffic volumes are 41.5 percent less than the typical 8-9 AM commuter peak hour. Hence, the 6-7 AM volumes were calculated by decreasing the 8-9 AM volumes by 41.5 percent.

The PM peak hour of construction was selected to be 3-4 PM since no construction trips are anticipated during the proposed project weekday non-game PM peak hour of 5-6 PM. The ATR volume comparison showed that 3-4 PM construction peak traffic volumes are approximately 2 percent less than the typical 5-6 PM peak hour. Hence, the 3-4 PM volumes were calculated by decreasing the 5-6 PM volumes by 2 percent.

Future Without Construction of the Proposed Project

The existing AM and PM peak construction hour volumes were increased to year 2031 using a background growth rate of 0.5 percent per year from 2012 to 2017 and 0.25 percent per year from 2017 to 2031, or a 6.2 percent growth in overall traffic volumes. In addition, No Action conditions for the construction analysis account for traffic generated by the anticipated No Action development sites identified in Chapter 14, “Transportation.” Similar to the existing volumes, these No Action increments were decreased by 41.5 percent in the AM and about 2 percent in the PM peak construction hours.

Overall intersection levels of service (LOS) would be at LOS C or better for all intersections during the 6-7 AM peak construction hour. In the 3-4 PM peak construction hour, ~~four~~ five intersections would operate at overall LOS C or better, ~~one~~ two would operate at LOS D and one would operate at LOS F. During the 6-7 AM peak construction hour, of the 35 traffic lane groups at these intersections, 21 would operate at LOS C or better, 13 would operate at LOS D and one would operate at LOS E. During the 3-4 PM peak construction hour, of the 36 traffic lane groups analyzed (there is one more in the PM peak hour), ~~20~~ 19 would operate at LOS C or better, eight would operate at LOS D, and ~~eight~~ nine would operate at LOS E or F.

Future With Construction of the Proposed Project

During the 6-7AM peak construction hour, construction activities would generate 1,071 construction worker auto trips and 64 delivery (in and out) truck trips. During the 3-4 PM peak construction hour, construction activities would generate 1,071 construction worker auto trips and 12 delivery truck trips. Auto trips were assigned along roadways leading to on-site parking facilities, and trucks were assigned to designated NYCDOT truck routes.

Levels of service for the 2031 With Action condition were determined for the eight intersections analyzed under the No Action condition. The unsignalized portion of the intersection of Willets Point Boulevard and 126th Street would be eliminated due to street demapping, while one new intersection—126th Street at New Willets Point Boulevard—would be created as part of the proposed project under Phase ~~2-1B~~. Future traffic levels of service under the 2031 With Action

condition are shown in **Tables 20-9** and **20-10**. Detailed levels of service tables are presented in **Appendix E-2**.

Table 20-9

Overall Intersection Level of Service Summary Comparison
Phase 2 (2031) Construction No Action vs. With Action Conditions – Non-Game Day

Signalized Intersections	Phase 2 No Action Condition		Phase 2 With Action Condition	
	Weekday AM	Weekday PM	Weekday AM	Weekday PM
	6 Signalized Intersections		7 Signalized Intersections	
Overall Intersection LOS A/B/C	6	4 <u>3</u>	6	1
Overall Intersection LOS D	0	4 <u>2</u>	0	1
Overall Intersection LOS E	0	0	0	4 <u>0</u>
Overall Intersection LOS F	0	1	1	4 <u>5</u>
No. of Locations with Significant Impacts	—	—	4 <u>2</u>	6
Notes: During the non-game peak hours in the Phase 2 With Action condition, one of the two unsignalized intersections analyzed would be significantly impacted in the weekday AM and PM peak hours.				

Table 20-10

Traffic Lane Group Level of Service Summary Comparison
Phase 2 (2031) Construction No Action vs. With Action Conditions – Non-Game Day

Signalized Intersections	Phase 2 No Action Condition		Phase 2 With Action Condition	
	Weekday AM	Weekday PM	Weekday AM	Weekday PM
	6 Signalized Intersections		7 Signalized Intersections	
No. of Lane Groups at LOS A/B/C	16	45 <u>14</u>	20 <u>18</u>	44 <u>13</u>
No. of Lane Groups at LOS D	13	8	11 <u>12</u>	5 <u>4</u>
No. of Lane Groups at LOS E	1	2	4 <u>2</u>	2 <u>1</u>
No. of Lane Groups at LOS F	0	6 <u>7</u>	2	46 <u>19</u>
Notes: <u>All five signalized lane groups would operate at LOS C or better during the non-game peak hours in the Phase 2 No Action condition. During the non-game peak hours in the Phase 2 With Action condition, one of the three unsignalized lane groups analyzed would operate at LOS F in the non-game weekday AM peak hour and one of the three unsignalized lane groups would operate at LOS F in the non-game weekday PM peak hour. of the two unsignalized intersections analyzed would be significantly impacted in the weekday AM and PM peak hours.</u>				

The summary overview of the Phase 2 construction condition indicates that:

- In the 6-7 AM peak construction hour, one of the seven analyzed signalized intersections is projected to operate at overall LOS F, which is one more than that under the No Action condition. (Note: there would be one more signalized intersection in the Phase 2 With Action condition as compared to the No Action condition.) One intersection Two signalized intersections and one unsignalized intersection would be significantly impacted. The number of traffic lane groups expected to operate at LOS E or F would increase from one to ~~three~~ five between the No Action and With Action conditions.
- In the 3-4 PM peak construction hour, five of the seven analyzed signalized intersections are projected to operate at overall LOS E or F, four more than under the No Action condition. Six signalized intersections and one unsignalized intersection would be significantly impacted. The number of traffic lane groups expected to operate at LOS E or F would increase from ~~eight to 18~~ nine to 21 (including 2 unsignalized lane groups not included in Table 20-10) between the No Action and ~~construction~~ With Action conditions.

All significantly impacted intersections could be fully or partially mitigated, the majority of which would require standard mitigation measures typically implemented by NYCDOT. In addition, two locations—126th Street at Northern Boulevard and 126th Street/Grand Central Parkway Ramp at 34th Avenue—would require special more intensive mitigation measures to

Willets Point Development

mitigate the significant impacts in the 3–4 PM peak construction hour. The recommended mitigation measures would be similar to those proposed to mitigate the intersection impacts associated with the project's build-out and occupancy. A discussion of the recommended mitigation measures for each of the impacted intersections is provided below.

- *Northern Boulevard at 126th Street*—Impacts on this intersection would occur during the 3–4 PM peak construction hour. The significant impacts expected on the northbound 126th Street approach and on eastbound and westbound Northern Boulevard (leading to the intersection from the Van Wyck and Whitestone Expressway off-ramps) could not be mitigated by applying traditional mitigation measures. Therefore, to fully mitigate significant impacts during the 3–4 PM peak construction hour, this intersection would require cost intensive mitigation measures. These measures include installation of quick-curb (i.e., plastic reflective pylons used for channelizing the traffic) and traffic signal louvers (used on traffic signals to avoid confusion on two closely spaced intersection approaches where approaching motorists may be able to see the signal indication for another approach) on the westbound approach between the right-most lane and the center lane to allow the Van Wyck and Whitestone Expressway ramp traffic to operate as free flow through the intersection, modification of signal timing, widening of the eastbound Northern Boulevard approach to the intersection from two 12-foot-wide lanes to three 10-foot-wide lanes, prohibition of pedestrian crossing in the east crosswalk and diversion of those pedestrians to the west crosswalk of Northern Boulevard at 126th Place, and implementation of signal timing changes needed to coordinate the northbound 126th Street approach with the upstream signal at the intersection of 126th Street and 34th Avenue.
- *34th Avenue at 126th Street*—Significant impacts are expected to occur on the slip ramp from GCP/Astoria Boulevard to 126th Street, eastbound Shea Road approach, and westbound 34th Avenue approach during both the 6–7 AM and 3–4 PM peak construction hours and the northbound de facto left turn movement on the northbound 126th Street approach during the 3–4 PM peak construction hour. The geometric complexity of this intersection, with approaches from two exit ramps in addition to the northbound 126th Street, eastbound Shea Road and westbound 34th Avenue approaches, limits traditional capacity improvement options. Signal timing changes would fully mitigate the significant impacts only during the 6–7 AM peak construction hour. To partially mitigate significant impacts during the 3–4 PM peak construction hour, this intersection would require cost intensive mitigation measures including closing the ramp from eastbound Northern Boulevard to 126th Street and diverting those vehicles to 126th Place and 34th Avenue, reconstructing and merging the Grand Central Parkway and Northern Boulevard ramp approaches to have one 11-foot-wide left turn lane, two 11-foot-wide travel lanes and one 11-foot-wide exclusive right turn lane, a channelized right turn from the Grand Central Parkway ramp to westbound Shea Road, widening the roadway on the east leg of the intersection to ~~40~~ 44 feet to provide two 11-foot-wide westbound approach lanes and two 11-foot-wide eastbound receiving lanes, restriping the northbound 126th Street approach from two 11-foot-wide travel lanes, one 12-foot-wide travel lane, and one 7-foot-wide hatched median to one 12-foot-wide exclusive left turn lane, two 12-foot-wide travel lanes, and one 5-foot-wide Class II bicycle lane, and modifying the signal timing and phasing plan.
- *Roosevelt Avenue at 114th Street*—Significant impacts would occur during the 3–4 PM peak construction hour on ~~the southbound 114th Street approach and the eastbound and westbound Roosevelt Avenue~~ all approaches. These impacts could be mitigated through geometric changes, signal phasing and timing plan changes, limited prohibition of parking,

- and pavement restriping. The centerline on the westbound approach would be shifted 11 feet to the south and the approach would be restriped from two 11-foot-wide travel lanes to one 11-foot-wide exclusive left turn lane, one 11-foot-wide through lane, and one 11-foot-wide exclusive right turn lane. The eastbound approach would be restriped from two 11-foot-wide travel lanes to one 11-foot-wide exclusive left turn lane and one 11-foot-wide travel lane. The centerline on the northbound approach would be shifted three feet to the east and the approach would be restriped from one 16-foot-wide travel lane to one 13-foot-wide travel lane. The centerline on the southbound approach would be shifted two feet to the east. Parking prohibitions at this location include installing “No Standing Anytime” regulations along the east curb of the northbound 114th Street approach 250 feet from the intersection, installing “No Standing Anytime” regulations along the south curb of the eastbound Roosevelt Avenue Street approach 250 feet from the intersection, and installing “No Standing 3–4 PM–7 PM Monday-Friday” regulations along the west curb of the southbound 114th Street approach 150 feet from the intersection to allow for one 12-foot-wide left-through lane and one 10-foot-wide right turn lane. Signal phasing and timing plans would also be modified.
- Roosevelt Avenue at 126th Street*—Significant impacts would occur during the 3–4 PM peak construction hour on the northbound and southbound 126th Street approaches and the eastbound Roosevelt Avenue de facto left turn movement. The intersection could be partially mitigated by reconfiguring the northbound 126th Street approach to have one 10-foot-wide exclusive left turn lane and two 10-foot-wide travel lanes. The centerline on the southbound 126th Street approach would be shifted nine feet to the east and restriped from one 11-foot-wide and one 12-foot-wide travel lane to one 11-foot-wide exclusive left turn lane, one 10-foot-wide through lane, and one 11-foot-wide exclusive right turn lane. The centerline of the eastbound Roosevelt Avenue approach would be shifted one foot to the north and the centerline of the westbound approach would be shifted one foot to the south. The eastbound approach would be restriped from one 10-foot-wide and one 11-foot-wide travel lane to two 11-foot-wide travel lanes and the westbound approach would be restriped from one 11-foot-wide travel lane and one 10-foot-wide travel lane to two 11-foot-wide travel lanes. The signal timing and phasing would also be modified.
 - Roosevelt Avenue at College Point Boulevard*—Significant impacts would occur during the 3–4 PM peak construction hour on the northbound College Point Boulevard left turn movement, the southbound College Point Boulevard approach, and the eastbound Roosevelt Avenue through-right turn movement. The impacts could be partially mitigated by ~~removing the center median on the east leg of Roosevelt Avenue and~~ restriping the westbound Roosevelt Avenue approach from ~~one 22-foot wide center median, one 13-foot-wide travel lane, and one 17-foot-wide travel lane to one 13-foot wide left turn pocket, one 9-foot wide tapered hatched median, one 11-foot wide travel lane and one 19-foot wide travel lane for 80 feet~~ two 15-foot-wide travel lanes. The northbound College Point Boulevard approach would be restriped from one 9-foot-wide exclusive left turn lane, one 13-foot-wide travel lane, and one 18-foot-wide travel lane with parking to two 10-foot-wide exclusive left turn lanes, and two 10-foot-wide travel lanes for 200 feet. The southbound College Point Boulevard approach would be restriped from one 11-foot-wide travel lane and one 19-foot-wide travel lane to three 10-foot-wide travel lanes for 200 feet. The northbound and southbound lanes in the Roosevelt Avenue median would be restriped from one 24-foot-wide travel lane, one 11-foot-wide travel lane, and one 10-foot-wide exclusive left turn lane in the northbound direction and one 10-foot-wide travel lane and one 20-foot-wide travel lane in the southbound direction to one 15-foot-wide travel lane, one 10-foot-wide travel

lane, and two 10-foot-wide exclusive left turn lanes in the northbound direction, and three 10-foot-wide travel lanes in the southbound direction. Parking prohibitions would include installing “No Standing Anytime” regulations along the east curb of the northbound approach of College Point Boulevard for 250 feet and along the west curb of the southbound approach for 200 feet. Southbound right turn traffic on College Point Boulevard would be prohibited and directed to use 39th Avenue and Janet Place and westbound left-turn traffic on Roosevelt Avenue would be prohibited and directed to use Janet Place and 39th Avenue en route back to southbound College Point Boulevard. Additionally, the signal timing and phasing would be modified.

- *College Point Boulevard at Northern Boulevard Service Road*—The westbound approach of the Northern Boulevard service road would be significantly impacted during the 3–4 PM peak construction hour, but could be fully mitigated by modifying the signal timing.
- *Boat Basin Road at World’s Fair Marina*—Significant impacts would occur on the northbound Boat Basin Road left turn movement during the 6–7 AM and 3–4 PM peak construction hours. The intersection would be fully mitigated by installing a traffic signal with a 90 second cycle length, striping the westbound approach as one 11-foot-wide left turn lane and one 11-foot-wide shared left-through lane, and striping the northbound approach as two 10-foot-wide left turn lanes and one 10-foot-wide right turn lane.
- *126th Street at New Willets Point Boulevard*—Significant impacts are not expected during either of the analysis peak hours.

In addition to the above impact and mitigation findings described for peak construction in 2031, the significant adverse traffic impacts disclosed for the 2032 With Action condition may also occur during peak construction in 2031. Similar mitigation measures as those identified for the 2032 With Action condition are expected to also address the potential traffic impacts during construction. As with the 2032 With Action condition, several of the projected traffic impacts during various analysis peak periods may remain unmitigated.

DELIVERIES

Construction trucks would be required to use NYCDOT-designated truck routes, including the Van Wyck Expressway, the Long Island Expressway (LIE), Northern Boulevard, Roosevelt Avenue, and College Point Boulevard. At the construction site, flaggers would manage the access and movements of trucks. Limited site deliveries may occur along the perimeters of the construction sites within delineated closed-off areas for concrete pour or steel delivery.

CURB LANE CLOSURES AND STAGING

Curb lanes and sidewalks within and adjacent to the project site might be temporarily closed due to construction activities. Sidewalk protection or temporary sidewalks would be provided to maintain pedestrian access. Staging areas would be required from the start of foundation work until cranes and hoists are completely removed at the completion of the core and shell stage. Because the majority of construction activities would be accommodated on-site, construction trucks would be staged primarily at each construction site and available areas adjacent to CitiField and within the District. Maintenance and protection of traffic plans would be developed for all anticipated curb lane and sidewalk closures.

PARKING

The construction activities would generate a maximum daily parking demand of 1,339 spaces in the first quarter of 2031. Parking would be managed within available parking in the South Lot/Lot D and the District, and if necessary, supplemented by the existing parking areas adjacent to the District. As with the 2032 With Action condition, there would not be a parking impact during construction.

TRANSIT

With approximately 70 percent of the construction workers predicted to commute via auto, the remaining 30 percent would travel to and from the construction sites via transit. Based on the peak first quarter 2031 projections (maximum of 2,200 average daily construction workers), this distribution would represent correspondingly up to 660 daily workers traveling by transit. With 80 percent of these workers arriving or departing during the construction peak hours, the estimated number of total peak hour transit trips would be 528. These construction worker trips would occur outside of peak periods of transit ridership and would be distributed and dispersed to the nearby transit facilities, and would not result in any significant adverse transit impacts. However, the significant adverse transit impacts disclosed for the 2032 With Action condition may also occur during peak construction in 2031. Similar mitigation measures as those identified for the 2032 With Action condition (i.e., stairway widening at the Mets-Willets Point subway station and bus frequency increase) are expected to also address the potential transit impacts during construction. As with the 2028 and 2032 With Action conditions, projected line-haul impacts may remain unmitigated. ~~Additionally, as discussed in more detail in Chapter 14, "Transportation," and Chapter 21, "Mitigation," subway station impacts may remain unmitigated, if mitigation options are found to be infeasible, or if NYCT changes the current game day operation of the station.~~

PEDESTRIANS

Sidewalk protection or temporary sidewalks would be provided in accordance with NYCDOT requirements to maintain pedestrian access for most construction periods. With a maximum of 2,200 average daily construction workers, as shown in **Appendix E**, there would be up to approximately 1,760 workers arriving or departing during the construction peak hours via various modes of transportation. These pedestrian trips would primarily be concentrated during off-peak hours (6 to 7 AM and 3 to 4 PM) and would be distributed among numerous pedestrian facilities (i.e., sidewalks, corner reservoirs, and crosswalks) in the area. Accordingly, there would also not be a potential for significant adverse pedestrian impacts attributable to the projected construction worker pedestrian trips. However, the significant adverse pedestrian impacts disclosed for the 2032 With Action condition may also occur during peak construction in 2031. Similar mitigation measures as those identified for the 2032 With Action condition (i.e., crosswalk widening) are expected to also address the potential pedestrian impacts during construction. Where mitigation measures may be deemed impractical to mitigate the projected With Action significant adverse pedestrian impacts, those impacts could similarly be unmitigatable during construction.

AIR QUALITY

INTRODUCTION

Emissions from on-site construction equipment and on-road construction-related vehicles, and the effect of construction vehicles on background traffic congestion, have the potential to affect air quality. The analysis of potential impacts of the construction of the proposed project on air quality includes a quantitative analysis of both on-site and on-road sources of air emissions, and the overall combined impact of both sources, where applicable.

In general, most construction engines are diesel-powered, and produce relatively high levels of nitrogen oxides (NO_x) and particulate matter (PM). Construction activities also emit fugitive dust. Although diesel engines emit much lower levels of carbon monoxide (CO) than gasoline engines, the stationary nature of construction emissions and the large quantity of engines could lead to elevated CO concentrations, and impacts on traffic could increase mobile source-related emissions of CO as well. Therefore, the pollutants analyzed for the construction period are nitrogen dioxide (NO_2), particles with an aerodynamic diameter of less than or equal to 10 micrometers (PM_{10}), particles with an aerodynamic diameter of less than or equal to 2.5 micrometers ($\text{PM}_{2.5}$), and CO. Since ultra-low-sulfur diesel (ULSD) would be used for all diesel engines used in the construction of the proposed project, sulfur oxides (SO_x) emitted from those construction activities would be negligible. For more details on air pollutants, see Chapter 15, “Air Quality.”

Construction activity in general, and large-scale construction in particular, has the potential to adversely affect air quality as a result of diesel emissions. The main component of diesel exhaust that has been identified as having an adverse effect on human health is fine PM. To ensure that the construction of the proposed project results in the lowest practicable diesel particulate matter (DPM) emissions, the project sponsors would implement an emissions reduction program for all construction activities, consisting of the following components:

- *Diesel Equipment Reduction.* Construction of the proposed project would minimize the use of diesel engines and use electric engines, to the extent practicable. QDG would apply for a grid power connection early on so as to ensure the availability of grid power, reducing the need for on-site generators, and require the use of electric engines in lieu of diesel where practicable.
- *Clean Fuel.* Ultra-low sulfur diesel (ULSD) would be used exclusively for all diesel engines throughout the construction sites, to the extent practicable.
- *Best Available Tailpipe Reduction Technologies.* Nonroad diesel engines with a power rating of 50 horsepower (hp) or greater and controlled truck fleets (i.e., truck fleets under long-term contract with the project) including but not limited to concrete mixing and pumping trucks, would utilize the best available tailpipe (BAT) technology for reducing DPM emissions. Diesel particle filters (DPFs) have been identified as being the tailpipe technology currently proven to have the highest reduction capability. Construction contracts would specify that all diesel nonroad engines rated at 50 hp or greater would utilize DPFs to the extent practicable, either installed on the engine by the original equipment manufacturer (OEM) or a retrofit DPF verified by the EPA or the California Air Resources Board, and

may include active DPFs,¹ if necessary; or other technology proven to ~~reduce DPM by at least 90 percent~~ achieve equivalent emissions reduction. This measure is expected to reduce site-wide tailpipe PM emissions by at least 90 percent.

- *Utilization of Newer Equipment.* EPA's Tier 1 through 4 standards for nonroad engines regulate the emission of criteria pollutants from new engines, including PM, CO, NO_x, and hydrocarbons (HC). All nonroad construction equipment in the proposed project with a power rating of 50 hp or greater would meet at least the Tier 3 emissions standard, to the extent practicable. Tier 3 NO_x emissions range from 40 to 60 percent lower than Tier 1 emissions and considerably lower than uncontrolled engines. All nonroad engines in the project rated less than 50 hp would meet at least the Tier 2 emissions standard.
- *Dust Control.* Fugitive dust control plans would be required as part of contract specifications. For example, stabilized truck exit areas would be established for washing off the wheels of all trucks that exit the construction site. Truck routes within the sites would be either watered as needed or, in cases where such routes would remain in the same place for an extended duration, the routes would be stabilized, covered with gravel, or temporarily paved to avoid the re-suspension of dust. All trucks hauling loose material would be equipped with tight fitting tailgates and their loads securely covered prior to leaving the sites. Chutes would be used for material drops during demolition. Water sprays would be used for all excavation, demolition, and transfer of spoils to ensure that materials are dampened as necessary to avoid the suspension of dust into the air. Loose materials would be watered, stabilized with a biodegradable suppressing agent, or covered. In addition, all necessary measures would be implemented to ensure that the New York City Air Pollution Control Code regulating construction-related dust emissions is followed.
- *Source Location.* In order to reduce the resulting concentration increments, large emissions sources and activities such as concrete trucks and pumps would be located away from residential buildings and publicly accessible open spaces to the extent practicable and feasible.
- *Idle Restriction.* In addition to adhering to the local law restricting unnecessary idling on roadways, on-site vehicle idle time will also be restricted to three minutes for all equipment and vehicles that are not using their engines to operate a loading, unloading, or processing device (e.g., concrete mixing trucks) or otherwise required for the proper operation of the engine.

Additional measures may be taken to reduce pollutant emissions during construction of the proposed project in accordance with all applicable laws, regulations, and building codes. Overall, the proposed emission reduction program is expected to significantly reduce DPM emissions consistent with the goals of the currently best available control technologies under New York City Local Law 77, which are required only for publically funded City projects.

As discussed in Chapter 15, "Air Quality," EPA recently established a 1-hour average standard for NO₂. Great uncertainty exists as to 1-hour NO₂ background concentrations at ground level, especially near roadways, since these concentrations have not been measured. In addition, there are no clear methods to predict the rate of transformation of NO to NO₂ at ground-level given

¹ There are two types of DPFs currently in use: passive and active. Most DPFs currently in use are the "passive" type, which means that the heat from the exhaust is used to regenerate (burn off) the PM to eliminate the buildup of PM in the filter. Some engines do not maintain temperatures high enough for passive regeneration. In such cases, "active" DPFs can be used (i.e., DPFs that are heated either by an electrical connection from the engine, by plugging in during periods of inactivity, or by removal of the filter for external regeneration).

the level of existing data and models. Therefore, the significance of predicted construction impacts cannot be determined based on comparison with the new 1-hour NO_2 NAAQS since total 98th percentile values, including local area roadway contributions, cannot be estimated. In addition, methods for accurately predicting 1-hour NO_2 concentrations from construction activities have not been developed. However, exceedances of the 1-hour NO_2 standard resulting from construction activities cannot be ruled out and therefore, as discussed above, non-road diesel-powered vehicles and construction equipment rated Tier 3 or higher would be used during construction to reduce NO_x emissions. The electrification, source location and idling restrictions mentioned above would also reduce NO_x emissions and NO_2 concentration levels.

METHODOLOGY

Chapter 15, “Air Quality,” contains a review of the pollutants for analysis; applicable regulations, standards, and benchmarks; and general methodology for stationary and mobile source air quality analyses. The general methodology for stationary source modeling (regarding model selection, receptor placement, and meteorological data) presented in Chapter 15 was followed for modeling dispersion of pollutants from on-site sources during the construction period. Additional details relevant only to the construction air quality analysis methodology are presented in the following section.

The *CEQR Technical Manual* states that the significance of a likely consequence (i.e., whether it is material, substantial, large, or important) should be assessed in connection with its setting (e.g., urban or rural), its probability of occurrence, its duration, its irreversibility, its geographic scope, its magnitude, and the number of people affected. In terms of the magnitude of air quality impacts, an action predicted to increase the concentration of a criteria air pollutant to a level that would exceed the NAAQS, or increase the concentration of $\text{PM}_{2.5}$ above the ~~interim guidance thresholds~~ de minimis criteria, could have an adverse impact of significant magnitude. The factors identified above would then be considered in determining the overall significance of the potential impact.

On-Site Construction Activity Assessment

The CitiField Stadium, the home of the New York Mets major league baseball team, is located near the construction sites. However, most of the baseball games would occur during weeknights or weekends when limited construction activities are expected for the proposed project. Therefore, construction activities would not likely impair the enjoyment of stadium users. Since there are no other sensitive residential and open space receptors located near the construction of Phases 1A and 1B, the quantitative analysis focused on Phase 2 construction of the proposed project, which would be built in proximity of residential and open space areas.

To determine which construction periods constitute the worst-case periods for the pollutants of concern (PM , CO , NO_2), construction-related emissions were calculated throughout the duration of construction on an annual and peak day basis for $\text{PM}_{2.5}$. $\text{PM}_{2.5}$ was selected for determining the worst-case periods for all pollutants as analyzed, because the ratio of $\text{PM}_{2.5}$ emissions to impact criteria is higher than for other pollutants. Therefore, initial estimates of $\text{PM}_{2.5}$ emissions throughout the construction years were used for determining the worst-case periods for analysis of all pollutants. Generally, emission patterns of PM_{10} and NO_2 would follow $\text{PM}_{2.5}$ emissions, since they are related to diesel engines by horsepower (hp). CO emissions may have a somewhat different pattern but generally would also be highest during periods when the most activity would occur. Based on the resulting multi-year profiles of annual average and peak day average emissions of $\text{PM}_{2.5}$, and the proximity of the construction activities to residences and publicly

accessible open spaces, a worst-case year and a worst-case short-term period for construction were identified for dispersion modeling of annual and short-term (i.e., 24-hour, 8-hour, and 1-hour) averaging periods. Dispersion of the relevant air pollutants from the sites during these periods was then analyzed, and the highest resulting concentrations are presented in the following sections. Broader conclusions regarding potential concentrations during other periods, which were not modeled, are presented as well, based on the multi-year emissions profiles and the worst-case period results.

The sizes, types, and number of construction equipment were estimated based on the construction activity schedule. Emission factors for NO_x, CO, PM₁₀, and PM_{2.5} from on-site construction engines were developed using the EPA's NONROAD2008 Emission Model (NONROAD). Since emission factors for concrete pumps are not available from either the EPA Motor Vehicle Emission Simulator (MOVES) emissions model or NONROAD, emission factors specifically developed for this type of application were used.¹ With respect to trucks, emission rates for NO_x, CO, PM₁₀, and PM_{2.5} for truck engines were developed using MOVES.

As described in the introduction above, the project sponsors would be committed to a number of measures to reduce air pollutant emissions during construction of the proposed project, with special attention given to DPM. These measures include the exclusive use of ULSD for all construction engines, the use of Tier 3 or newer equipment with DPFs (OEM or the equivalent tailpipe controls to reduce DPM emissions by at least 90 percent compared with normal private construction practices) during construction on all nonroad construction engines with an engine output rating of 50 hp or greater. In addition, controlled truck fleets (i.e., truck fleets under long-term contract, such as concrete trucks) would use trucks equipped with DPFs.

Based on the above commitments, emission factors for the construction of the proposed project were calculated assuming the exclusive use of ULSD, diesel engines of Tier 3 certification, and the application of DPFs on all nonroad diesel engines 50 hp or greater and on concrete delivery and pumping trucks; other trucks were assumed to have emissions consistent with the general truck fleet (all on-road diesel vehicles currently use ULSD, as mandated by federal regulations). PM_{2.5} emission factors for engines retrofit with a DPF (i.e., all nonroad engines with a power output of 50 hp or greater and all concrete delivery trucks) were calculated as 10 percent of the NONROAD Tier 3 emission factors. The emission factors specifically developed for concrete pump trucks were also reduced by 90 percent to account for the DPFs. All personnel/material hoists and small hand tools would be electric and would therefore have no associated emissions.

In addition to engine emissions, fugitive dust emissions from operations (e.g., excavation and loading excavated materials into dump trucks) were calculated based on EPA procedures delineated in AP-42 Table 13.2.3-1. It was estimated that the planned control of fugitive emissions would reduce PM emissions from such processes by 50 percent. A robust watering program would be implemented for all demolition, excavation, and transfer of loose materials to and from trucks.

¹ Concrete pumps are truck mounted and use the truck engine to power the pumps at high load. This application of truck engines is not addressed by the MOVES model, and since it is not a non-road engine, it is not included in the NONROAD model. Emission factors were obtained from a study which developed factors specifically for this type of activity. *FEIS for the Proposed Manhattanville in West Harlem Rezoning and Academic Mixed-Use Development*, CPC-NYCDP, November 16, 2007.

The resulting emission factors were used for the emissions and dispersion analyses. Average annual (running 12-month averages) and peak-day $PM_{2.5}$ engine emissions profiles for the entire duration of the construction were prepared by multiplying the above emission rates by the number of engines, the work hours per day, and fraction of the day each engine would be expected to work during each month. The resulting overall peak day and annual average emission profiles are presented in **Figures 20-5** and **20-6**. Based on the $PM_{2.5}$ construction emissions profiles, August 2029 and the year from August 2029 to July 2030 were identified as the worst-case short-term and annual periods, respectively, since the highest project-wide emissions were predicted in these periods, construction activities would occur simultaneously at parcels A6, A7, A11, A12, A13, A14, A15 and A19, and the construction activities would take place in close proximity to completed Phase 1B residential locations and open spaces during these periods.

The dispersion of pollutants during the worst-case short-term and annual periods was then modeled in detail to predict resulting maximum concentration increments from construction activity and total concentrations (including background concentrations) in the surrounding area. Although the modeled results are based on construction scenarios for specific sample periods, conclusions regarding other periods, were derived based on the fact that lower concentration increments from construction would generally be expected during periods with lower construction emissions. As presented in **Figures 20-5** and **20-6**, emissions during other periods would be lower—often much lower—than the peak emissions. However, since the worst-case short-term results may often be indicative of very local impacts, similar maximum local impacts may occur at any stage at various locations but would not persist in any single location, since emission sources would not be located continuously at any single location throughout construction. Equipment would move throughout the site as construction progresses.

For the short-term model scenarios, predicting concentration averages for periods of 24 hours or less, all stationary sources, such as compressors, pumps, or concrete trucks, which idle in a single location while unloading, were simulated as point sources. Other engines, which would move around the site on any given day, were simulated as area sources. For periods of 8 hours or less (less than the length of a shift), it was assumed that all engines would be active simultaneously. All sources would move around the site throughout the year and were therefore simulated as area sources in the annual analyses.

Receptors (locations in the model where concentrations are predicted) were placed along the sidewalks surrounding the construction sites on both sides of the street at locations that would be publicly accessible, at residential and other sensitive uses at both ground-level and elevated locations (e.g., residential windows), at completed and occupied Phase 1B buildings, and at open spaces.

Mobile Source Assessment

The general methodology for mobile source modeling presented in Chapter 15 was followed for intersection modeling during the construction period. The CAL3QHC model was used to perform mobile source CO computations, while CAL3QHCR, a refined version of the CAL3QHC model, was used to determine motor vehicle generated PM concentrations. The intersection selected for CO, PM_{10} and $PM_{2.5}$ modeling is presented in **Table 20-11**. This intersection was selected after considering all intersection locations analyzed for the traffic study because it is a signalized location where the greatest number of cumulative construction and operational vehicles generated by the proposed project and, therefore, the maximum change in the concentrations and greatest potential for air quality impacts is expected.

Cumulative Assessment

Since emissions from on-site construction equipment and on-road construction-related vehicles may contribute to concentration increments concurrently, a cumulative assessment was undertaken to determine the potential effect of these sources combined. The mobile source and stationary source analyses are performed separately with different dispersion models, as appropriate for the different types of analyses. Total cumulative concentration increments were estimated qualitatively by examining the highest results from the on-site construction analysis to the maximum mobile-source increments from the mobile source site closest to the location of the on-site construction activities. The combination of the results from different models is a conservatively high estimate of potential impacts, since it is likely that the highest results from different sources would occur under different meteorological conditions (e.g., different wind direction and speed) and would not actually occur simultaneously.

FUTURE WITHOUT THE PROPOSED PROJECT

Background Air Quality

In the future without the proposed project, there would likely be much less or possibly no development at the proposed sites. Since air quality regulations mandated by the Clean Air Act are anticipated to maintain or improve air quality in the region, it can be expected that air quality conditions in the future without the proposed project would be similar to or no worse than those that presently exist. However, it should be noted that, without the proposed project, the current auto-related and other industrial uses—as well as the attendant pollutants emitted by those uses—would continue to have an effect on local air quality.

Mobile Source Assessment

CO

CO concentrations without the proposed project were determined using the methodology previously described. **Table 20-12** shows future maximum predicted 8-hour average CO concentrations at the analysis intersections without the proposed project. The values shown are the highest predicted concentrations for the receptor locations for any of the time periods analyzed. As indicated in **Table 20-12**, the predicted 8-hour concentrations of CO, including background, are below the corresponding ambient air quality standard.

Table 20-12
8-Hour Average CO Concentrations
Without the Proposed Project (ppm)

Analysis Site	Location	8-Hour Concentration	NAAQS
1	34th Avenue and 126th Street	2.1	9
Note: An adjusted ambient background concentration of 2.0 ppm is included in the No Action values presented above.			

PM

Concentrations of PM₁₀ and PM_{2.5} from mobile sources without the proposed project were also determined. Concentrations of PM₁₀ included a 24-hour averaging period and PM_{2.5} included the 24-hour and annual averaging periods. As shown in **Table 20-13**, including a background concentration of 50 µg/m³, the maximum PM₁₀ 24-hour No Action concentrations are predicted to be below the applicable NAAQS of 150 µg/m³. Note that PM_{2.5} concentrations for No Action condition are not presented, since impacts are assessed on an incremental basis.

Without the Proposed Project (µg/m³)

Analysis Site	Location	24-Hour Concentration	NAAQS
1	34th Avenue and 126th Street	63.7	150
Note: An adjusted ambient background concentration of 50 µg/m ³ is included in the No Action values presented above.			

FUTURE WITH THE PROPOSED PROJECT

On-Site Construction Activity Assessment

Maximum predicted concentration increments from construction of the proposed project, and overall concentrations including background concentrations, are presented in **Table 20-14**. For PM_{2.5}, monitored concentrations are not added to modeled concentrations from sources, since impacts are determined by comparing the predicted increment from the proposed project as compared to the No Action with the ~~interim guidance~~ *de minimis* criteria. The total maximum combined concentrations, including mobile sources and construction, are presented in the “Cumulative Assessment” section, below.

The maximum predicted total concentrations of PM₁₀, CO, and annual-average NO₂ are not expected to exceed the NAAQS.

From the on-site sources related to the construction, the maximum predicted 24-hour average PM_{2.5} incremental concentration (3.3µg/m³) ~~would occur~~ ~~occurred~~ at a sidewalk receptor location southwest of the construction activities at parcel A11. This maximum predicted 24-hour average PM_{2.5} incremental concentration would not exceed the *de minimis* criterion of 4.5 µg/m³. The maximum predicted neighborhood-scale annual average PM_{2.5} concentration would be 0.001 µg/m³—lower than the *de minimis* criterion of 0.1 µg/m³, and the maximum predicted local annual average PM_{2.5} concentration would be less than the applicable *de minimis* criterion.

The maximum predicted 24-hour average and annual-average PM_{2.5} concentration increments exceeded 2 µg/m³ at a few sensitive residential receptor locations would occur on the northeastern façade of parcel A1 immediately southwest of the construction of parcel A11. As shown in **Table 20-4**, the maximum predicted 24-hour average and annual-average PM_{2.5} incremental concentrations would not exceed the *de minimis* criterion of 4.5 µg/m³ and 0.1 µg/m³ respectively. (See **Figure 1-6** for locations of parcels A1 and A11). At these locations, the maximum predicted frequency ranged from one to four times per year with an annual average frequency of two times per year or less.

Therefore, the predicted concentrations and increments from on-site construction sources associated with the proposed project would not result in any significant adverse air quality impacts.

Table 20-14

Maximum Predicted Pollutant Concentrations from Construction Site Sources
($\mu\text{g}/\text{m}^3$)

Pollutant	Averaging Period	No Action	Proposed Project	Increment	<i>De Minimis</i>	NAAQS
Residence, Academic Buildings or Open Space						
PM _{2.5}	24-hour ¹	—	—	2.7 ³	4.5 ²	35
	Annual Local ¹	—	—	0.19	0.30	15
PM ₁₀	24-hour	50	54.7	4.7	—	150
NO ₂	Annual	43	56.4	13.4	—	100
CO	1-hour	3.4 ppm	4.5 ppm	1.1 ppm	—	35 ppm
	8-hour	2.0 ppm	2.5 ppm	0.5 ppm	—	9 ppm
Sidewalks and Covered Walkways Adjacent to Construction						
PM _{2.5}	24-hour ¹	—	—	3.3 ³	4.5 ²	35
	Annual Local ¹	—	—	0.21	0.30	15
PM ₁₀	24-hour	50	55.5	5.5	—	150
NO ₂	Annual	43	60.6	17.6	—	100
CO	1-hour	3.4 ppm	0.6 ppm	4.0 ppm	—	35 ppm
	8-hour	2.0 ppm	0.3 ppm	2.3 ppm	—	9 ppm
Notes: Results for any other time period would be lower. PM _{2.5} concentration increments were compared with threshold values. Total concentrations were compared with the NAAQS. ¹ Monitored concentrations are not added to modeled PM _{2.5} values. ² NYCDEP is currently applying threshold criteria for assessing the significance of 24-hour average PM _{2.5} impacts. The significance of temporary concentration increments greater than 2 $\mu\text{g}/\text{m}^3$ is assessed in the context of the magnitude, frequency, duration, location and size of area affected by the concentration increment. <u>The PM_{2.5} <i>de minimis</i> criteria superseded the PM_{2.5} interim guidance criteria on June 5, 2013. The 24-hour average interim guidance criteria for PM_{2.5} were as follows: > 2 $\mu\text{g}/\text{m}^3$ (5 $\mu\text{g}/\text{m}^3$ not-to-exceed value), based on the magnitude, frequency, duration, location, and size of the area of the predicted concentrations.</u> ³ This value exceeds the interim guidance threshold level. See text for further discussion. <u>The PM_{2.5} increments shown are less than the <i>de minimis</i> value. These increments were not considered significant when they were compared with the interim guidance criteria in the DSEIS, and are also not significant when compared to the <i>de minimis</i> value.</u>						

The maximum predicted concentrations are probably overstated because the model did not include the effects of the noise reduction wall along the site perimeter that would be between sensitive receptors and the source of the emissions. The location of the maximum 24-hour average increments would vary based on the location of the sources during construction, which would move throughout the site over time. Therefore, continuous daily exposures would not be likely to occur at any one location. Based on the limited duration and extent of these predicted exceedances, the low frequency of occurrence, and the limited potential for exposure, this would not result in significant adverse impacts.

These maximum increments were computed for the peak construction period; for other construction time periods with lesser emissions, the potential 24-hour increments would be less. The maximum predicted neighborhood scale annual average PM_{2.5} concentration would be 0.001 $\mu\text{g}/\text{m}^3$ —lower than the interim guidance threshold level of 0.1 $\mu\text{g}/\text{m}^3$, and the maximum predicted local annual average PM_{2.5} concentration would be less than the applicable interim guidance threshold.

Construction during Phases 1A and 1B of the Proposed Project

Based on the results of the detailed quantitative analysis of construction air quality during Phase 2, the effects of construction during the earlier phases of the proposed project could be

qualitatively evaluated. As described above, besides CitiField Stadium, there are no sensitive residential and open space receptors located near the construction of Phases 1A and 1B of the proposed project. However, most of the baseball games would occur during weeknights or weekends when limited construction activities are expected for the proposed project. Therefore, construction activities would not likely impair the enjoyment of Stadium users. Although Phase 1A construction activities would be nearest to the sensitive receptor locations west of 114th Street, these receptor locations are more than 500 feet away from the Phase 1A construction site. Such distance between the emissions sources and these receptors locations would result in enhanced dispersion of pollutants and therefore potential concentration increments from on-site sources at such locations would be reduced. A review of the surrogate receptors from the detailed analysis performed for Phase 2 construction activities showed that results at 500 feet away from the sources would result in concentrations well below the corresponding standards and thresholds. Therefore, there would be no significant adverse construction air quality impacts at sensitive receptor locations west of 114th Street. Furthermore, Phase 2 would include the most intense construction activities during construction of the proposed project as compared to Phases 1A and 1B. Therefore, since the construction of Phase 2 of the proposed project would not result in significant adverse impacts with respect to air quality, Phases 1A and 1B construction activities would also not result in significant adverse impacts with respect to air quality.

Mobile Source Assessment

A mobile source air quality analysis was conducted for the project during construction activities at the site for the peak construction traffic year of 2030. Localized pollutant impacts from the vehicles queuing at the selected intersection were analyzed for CO for the 8-hour averaging period. PM₁₀ was analyzed for the 24-hour averaging period and PM_{2.5} was analyzed for the 24-hour and annual averaging periods.

CO

CO concentrations with the proposed project were determined using the methodology previously described. **Table 20-15** shows the future maximum predicted 8-hour average CO concentration with the proposed project at the analysis intersections studied. (No 1-hour values are shown, since no exceedances of the NAAQS would occur and the *de minimis* criteria are only applicable to 8-hour concentrations; therefore, the 8-hour values are the most critical for impact assessment.) The values shown are the highest predicted concentrations for the time periods analyzed. In addition, the incremental increases in 8-hour average CO concentration is small, and consequently would not result in a violation of the CEQR *de minimis* CO criteria. Therefore, construction of the proposed project would not result in any significant CO air quality impacts in the With Action condition.

Table 20-15
Maximum Predicted Future No Action and With Action
8-Hour Average CO Concentrations (ppm)

Analysis Site	Location	No Action 8-Hour Concentration	With Action 8-Hour Concentration	Increment	De Minimis	NAAQS
1	34th Avenue and 126th Street	2.1	2.6	0.5	3.4	9
Note: An adjusted ambient background concentration of 2.0 ppm is included in the No Action values presented above.						

PM

Concentrations of PM₁₀ and PM_{2.5} from mobile sources with the proposed project were also determined. **Table 20-16** shows the future maximum predicted 24-hour average PM₁₀

concentrations with the proposed project. The values shown are the highest predicted concentrations for all locations analyzed and include the ambient background concentrations. The results indicate that the construction of the proposed project would not result in any violations of the PM₁₀ standard or any significant adverse impacts on air quality.

Table 20-16
Maximum Predicted Future No Action and With Action
24-Hour Average PM₁₀ Concentrations (µg/m³)

Analysis Site	Location	No Action 24-Hour Concentration	With Action 24-Hour Concentration	NAAQS
1	34th Avenue and 126th Street	63.6	80.3	150
Note: An adjusted ambient background concentration of 50 µg/m ³ is included in the No Action values presented above.				

Future maximum predicted 24-hour and annual average PM_{2.5} concentration increments were calculated so that they could be compared to the ~~interim guidance~~ *de minimis* criteria that would determine the potential significance of any impacts from the proposed project. Based on this analysis, the maximum predicted localized 24-hour average and neighborhood-scale annual average incremental PM_{2.5} concentrations are presented in **Tables 20-17** and **20-18**, respectively. The results show that the maximum daily (24-hour) PM_{2.5} increments are predicted to be below the applicable ~~interim guidance~~ *de minimis* criterion of 54.5 µg/m³, and the maximum annual average PM_{2.5} increments are not predicted to exceed the applicable ~~interim guidance~~ *de minimis* criterion of 0.1 µg/m³. Therefore, the predicted PM_{2.5} increments from mobile sources associated with construction of the proposed project would not result in any significant adverse impacts on air quality.

Table 20-17
Maximum Predicted Future
24-Hour Average PM_{2.5} Concentration Increments (µg/m³)

Analysis Site	Location	Increment	<i>De Minimis</i>
1	34th Avenue and 126th Street	3.1	<u>4.5</u>
Note: The PM _{2.5} <i>de minimis</i> criteria superseded the PM _{2.5} interim guidance criteria on June 5, 2013. The 24-hour average interim guidance criteria for PM _{2.5} were as follows: 24-hour average, ≥ 2 µg/m ³ (5 µg/m ³ not-to-exceed value), based on the magnitude, frequency, duration, location, and size of the area of the predicted concentrations. The PM _{2.5} increments shown are less than the <i>de minimis</i> value. These increments were not considered significant when they were compared with the interim guidance criteria in the DSEIS, and are also not significant when compared to the <i>de minimis</i> value.			

Table 20-18
Maximum Predicted Future
Neighborhood Scale PM_{2.5} Concentrations (µg/m³)

Analysis Site	Location	Increment	<i>De Minimis</i>
1	34th Avenue and 126th Street	0.09	0.1
Note: PM _{2.5} interim guidance <i>de minimis</i> criteria—annual average (neighborhood scale) greater than 0.1 µg/m ³ . The <i>de minimis</i> criteria superseded the interim guidance criteria that were used for impact assessment in the DSEIS. For annual increments, the <i>de minimis</i> criteria are the same as the superseded interim guidance criteria.			

~~The maximum 24 hour average incremental PM_{2.5} concentration from mobile source analysis site 1, 3.1 µg/m³ (shown in **Table 20-17**), was predicted on the southeast corner of 34th Avenue and 126th Street. At this location, PM_{2.5} concentration increments above 2.0 µg/m³ were predicted to occur for at most six times in a year, and at an average of four times per year. At~~

~~other modeled locations, maximum predicted PM_{2.5} increments are predicted to be below the interim guidance criteria. Based on the magnitude, extent, and frequency of 24-hour average PM_{2.5} concentrations above 2.0 µg/m³, the proposed project would not result in significant PM_{2.5} impacts at the analyzed receptor locations. Additional air quality studies may be undertaken between the Draft SEIS and Final SEIS to further refine the construction mobile source analysis for the Phase 2 analysis year, in consultation with DEP.~~

Cumulative Assessment

As described in the cumulative assessment methodology section above, the combination of the highest results from separate analyses performed with different dispersion models are highly conservative, since it is likely that the highest results from different sources would occur under different meteorological conditions (e.g., different wind direction and speed) and would not actually occur simultaneously. In addition, as described above in the methodology section, August 2029 was identified as the worst-case short-term period since the highest project-wide emissions were predicted in these periods, when construction activities would occur simultaneously at parcels A6, A7, A11, A12, A13, A14, A15 and A19 and when construction activities would take place in close proximity to completed Phase 1B residential locations and open spaces. However, most of the activities during this peak period would be away from the intersection (34th Avenue and 126th Street) where the greatest number of cumulative construction and operational vehicles would be generated by the proposed project and away from the proposed school in A8 that would be constructed during Phase 1A.

As described above, from the on-site sources related to the construction, the maximum predicted 24-hour average PM_{2.5} incremental concentration (3.3 µg/m³) occurred at a sidewalk receptor location southwest of the construction activities at parcel A11. It should be noted that the maximum increments, predicted at sidewalks and covered walkways adjacent to construction, are overstated, since they do not include the effect of the solid fence and sidewalk protection on mixing. In addition, sidewalk locations are for transient use and people would not be expected to be present for extended durations. Furthermore, the location of the maximum 24-hour average increments would vary based on the location of the sources, which would move throughout the site over time. Therefore, continuous daily exposures would not be likely to occur at these locations. For PM_{2.5}, although the maximum predicted concentration due to stationary sources only (at a sensitive receptor location) and mobile sources only are 2.7 µg/m³ and 3.1 µg/m³, respectively, the combined effect of these sources ~~would be minimal and~~ would be much less than just adding the highest results, as explained below. ~~Similarly, for short term cumulative CO and PM₁₀ and annual PM_{2.5} concentrations, the combined effect of these sources would also be minimal and would be much less than just adding the highest results. In addition,~~ The peak construction traffic period corresponds to a time when interior fit-out construction work would occur in multiple buildings due to the number of deliveries and construction workers required for this task; however, interior fit-out work would generate the lowest levels of air emissions since most of the large diesel equipment (i.e., excavators, loaders) on-site would no longer be required during this stage of construction. In addition, 38th Avenue (between Buildings A1 and A11 where the maximum 24-hour average PM_{2.5} concentration from on-site construction sources is predicted) is not a major thoroughfare so a substantial percentage of the construction vehicles passing through 34th Avenue and 126th Street would not also pass through the 38th Avenue corridor. Furthermore, the maximum predicted concentrations resulting from stationary sources are likely to be overstated because the model does not include the shielding effects of the noise reduction wall along the site perimeter that would be between sensitive receptors and the source of the emissions. Moreover, the location of the maximum increments would vary based on the

location of the sources, which would move throughout the construction sites over time so continuous daily exposures would not be likely to occur at the same locations. Therefore, based on an analysis of all of the above factors affecting construction emissions and the limited potential for exposure, the combined effects of on-site and on-road construction sources would be minimal and not result in significant adverse impacts. Similarly, for short-term cumulative CO and PM₁₀ and annual PM_{2.5} concentrations, the combined effect of these sources would also be minimal and would be much less than just adding the highest results.

Further examination of the Phase 2 construction plan shows that activities at Buildings A5 and A7 would be located near the completed school within Building A8 and much closer to the intersection of 34th Avenue and 126th Street, where the greatest number of cumulative construction and operational vehicles would be generated by the proposed project, than the Phase 2 peak construction period. In terms of air pollutant emissions, the most intense construction activities are excavation and foundations work when multiple heavy duty diesel equipment (i.e., excavators, loaders etc.) would be used. However, as shown in **Figure 20-3**, the excavation and foundation activities for Buildings A5 and A7 would not coincide: the excavation and foundation activities for Building A5 is expected to occur from January 2028 to June 2028 while the excavation and foundation activities for Building A7 is expected to occur from August 2028 to February 2029. In addition, as shown in **Appendix E**, the peak combined construction emissions for Buildings A5 and A7 are expected to be four times less than that for the peak construction period. Therefore, the maximum 24-hour average PM_{2.5} concentration increments at the school within Building A8 due to construction activities at Buildings A5 and A7 would be much less than the 2.7 µg/m³ predicted during the peak Phase 2 construction period. Similarly, for short-term CO and PM₁₀ and annual PM_{2.5} concentrations, concentration increments at the school within Building A8 due to construction activities at Buildings A5 and A7 would be much less than the 0.5 ppm (8-hour CO), 4.7 µg/m³ (24-hour PM₁₀), and 0.19 µg/m³ (annual PM_{2.5}) predicted during the peak Phase 2 construction period. As explained above, the peak construction traffic period corresponds to a time when interior fit-out construction work would occur in multiple buildings due to the number of deliveries and construction workers required for this task; however, interior fit-out work would generate the lowest levels of air emissions since most of the large diesel equipment (i.e., excavators, loaders) on-site would no longer be required during this stage of construction. As shown in **Appendix E**, the peak construction traffic peak period would occur in the first quarter of 2031 and would generate more traffic than the period when peak on-site construction activities would occur at Buildings A5 and A7 (first quarter of 2028 to 1st quarter of 2029). Furthermore, the construction traffic on 35th Avenue (between Buildings A5 and A7, and the school within Building A8) is not a major thoroughfare such that a substantial percentage of the construction vehicles passing through 34th Avenue and 126th Street would not pass through the 35th Avenue corridor. Hence, the maximum 24-hour average PM_{2.5} concentration increments at the school within Building A8 due to mobile sources would be much less than the 3.1 µg/m³ predicted during the peak construction traffic period at the intersection of 34th Avenue and 126th Street. Similarly, for short-term CO and PM₁₀ and annual PM_{2.5} concentrations, concentration increments at the school within Building A8 due to mobile sources at Buildings A5 and A7 would be much less than the 0.5 ppm (8-hour CO), 30.3 µg/m³ (24-hour PM₁₀), and 0.09 µg/m³ (annual PM_{2.5}) predicted during the peak construction traffic period. Therefore, based on an analysis of all of the above factors affecting construction emissions, the combined effects of on-site and on-road construction sources at the school within Building A8 due to construction activities at Buildings A5 and A7 would also not result in significant adverse air quality impacts.

CONCLUSIONS

A detailed analysis of the combined effects of on-site and on-road emissions determined that annual-average NO₂, CO, ~~and PM₁₀, and PM_{2.5}~~ concentrations would be below their corresponding NAAQS or de minimis criteria. Therefore, the proposed project would not cause or contribute to any significant adverse air quality impacts with respect to these standards.

~~Dispersion modeling determined that the maximum predicted incremental concentrations of PM_{2.5} (using a worst case emissions scenario) would exceed the City's applicable 24 hour interim guidance criterion of 2 µg/m³ at a few receptor locations on the northeastern façade of parcel A1 during the construction activities at parcel A11 located immediately to the northeast, where the likelihood of prolonged exposure is very low. The maximum predicted incremental concentrations of PM_{2.5} would also be exceeded at a sidewalk location due to mobile sources on the southeast corner of 34th Avenue and 126th Street. The occurrences of elevated 24 hour average concentrations for PM_{2.5} would be limited in duration, frequency, and magnitude. Therefore, after taking into account the limited duration and extent of these predicted exceedances, and the limited area wide extent of the 24 hour impacts, it is concluded that no significant adverse air quality impacts for PM_{2.5} are expected from the on site construction sources.~~

Because background concentrations are not known and the analysis methodology for mobile and stationary sources has not been developed for the new 1-hour NO₂ NAAQS, exceedances of the 1-hour NO₂ standard resulting from construction activities cannot be ruled out. Therefore, measures including diesel equipment reduction, utilization of newer equipment, and source location and idling restriction, would be implemented by the proposed project to minimize NO_x emissions from construction

NOISE AND VIBRATION

INTRODUCTION

Potential impacts on community noise levels during construction of a proposed project can result from noise from construction equipment operation and from construction vehicles and delivery vehicles traveling to and from the site. Noise and vibration levels at a given location are dependent on the kind and number of pieces of construction equipment being operated, the acoustical utilization factor of the equipment (i.e., the percentage of time a piece of equipment is operating at full power), the distance from the construction site, and any shielding effects (from structures such as buildings, walls, or barriers). Noise levels caused by construction activities would vary widely, depending on the phase of construction and the location of the construction relative to receptor locations. The most significant construction noise sources are expected to be impact equipment such as jackhammers, excavators with ram hoes, drill rigs, rock drills, impact wrenches, tower cranes, and paving breakers, as well as the movements of trucks.

Noise from construction activities and some construction equipment is regulated by the New York City Noise Control Code and by the EPA. The New York City Noise Control Code, as amended December 2005 and effective July 1, 2007, requires the adoption and implementation of a noise mitigation plan for each construction site, limits construction (absent special circumstances as described below) to weekdays between the hours of 7:00 AM and 6:00 PM, and sets noise limits for certain specific pieces of construction equipment. Construction activities occurring after hours (weekdays between 6:00 PM and 7:00 AM, and on weekends) may be authorized in the following circumstances: (1) emergency conditions; (2) public safety; (3)

construction projects by or on behalf of City agencies; (4) construction activities with minimal noise impacts; and (5) where there is a claim of undue hardship resulting from unique site characteristics, unforeseen conditions, scheduling conflicts, and/or financial considerations. EPA requirements mandate that certain classifications of construction equipment meet specified noise emissions standards.

Given the scope and duration of construction activities for the proposed project, a quantified construction noise analysis was performed for Phase 2 of the proposed project. Based on the results of the detailed construction noise analysis of Phase 2 of the proposed project, construction noise associated with the earlier phases of construction was qualitatively evaluated. The purpose of this analysis was to determine if significant adverse noise impacts would occur during construction, and if so, to examine the feasibility of implementing mitigation measures to reduce or eliminate such impacts.

CONSTRUCTION NOISE IMPACT CRITERIA

Construction noise impact criteria consider the magnitude and the duration. If the magnitude of the noise level increments due to construction are below the impact criteria applied to the proposed project (3-5 dBA), they are not considered to be significant impacts. If the noise level increments due to construction exceed the 3-5 dBA criteria, the duration of the impacts would be also considered. The *CEQR Technical Manual* states that significant noise impacts due to construction would occur “only at sensitive receptors that would be subjected to high construction noise levels for an extensive period of time.” This has been interpreted to mean that such impacts would occur only at sensitive receptors where the activity with the potential to create high noise levels would occur continuously for approximately two years or longer.

In addition, the *CEQR Technical Manual* states that the impact criteria for vehicular sources, using the No Action noise level as the baseline, should be used for assessing construction impacts. As recommended in the *CEQR Technical Manual*, this study uses the following criteria to define a significant adverse noise impact:

- An increase of 5 dBA, or more, in Build $L_{eq(1)}$ noise levels at sensitive receptors (including residences, play areas, parks, schools, libraries, and houses of worship) over those calculated for the No Build condition, if the No Build levels are less than or equal to 60 dBA $L_{eq(1)}$ and the analysis period is not a nighttime period.
- An increase in Build $L_{eq(1)}$ noise levels at sensitive receptors of such that the total Build $L_{eq(1)}$ noise levels would be 65 dBA or greater, if the No Build levels are between 60 and 62 dBA $L_{eq(1)}$ and the analysis period is not a nighttime period.
- An increase of 3 dBA, or more, in Build $L_{eq(1)}$ noise levels at sensitive receptors over those calculated for the No Build condition, if the No Build levels are greater than or equal to 62 dBA $L_{eq(1)}$ and the analysis period is not a nighttime period.
- An increase of 3 dBA, or more, in Build $L_{eq(1)}$ noise levels at sensitive receptors over those calculated for the No Build condition, if the analysis period is a nighttime period (defined by the *CEQR Technical Manual* criteria as being between 10 PM and 7 AM).

NOISE ANALYSIS METHODOLOGY

Construction activities for the proposed project would be expected to result in increased noise levels as a result of: (1) the operation of construction equipment on-site; and (2) the movement of construction-related vehicles (i.e., worker trips, and material and equipment trips) on the

surrounding roadways. The effect of each of these noise sources was evaluated. The results presented below show the effects of construction activities (i.e., noise due to both on-site construction equipment and construction-related vehicle operation) and the total cumulative impacts due to operational effects (caused by project-generated vehicular trips) and construction effects (as construction proceeds on uncompleted components of the project).

Noise from the operation of construction equipment on-site at a specific receptor location near a construction site is calculated by computing the sum of the noise produced by all pieces of equipment operating at the construction site. For each piece of equipment, the noise level at a receptor site is a function of:

- The noise emission level of the equipment;
- A usage factor, which accounts for the percentage of time the equipment is operating at full power;
- The distance between the piece of equipment and the receptor;
- Topography and ground effects; and
- Shielding.

Similarly, noise levels due to construction-related traffic are a function of:

- The noise emission levels of the type of vehicle (e.g., auto, light-duty truck, heavy-duty truck, bus, etc.);
- Vehicular speed;
- The distance between the roadway and the receptor;
- Topography and ground effects; and
- Shielding.

CONSTRUCTION NOISE MODELING

Noise effects from Phase 2 construction activities were evaluated using the CadnaA model, a computerized model developed by DataKustik for noise prediction and assessment. The model can be used for the analysis of a wide variety of noise sources, including stationary sources (e.g., construction equipment, industrial equipment, power generation equipment), transportation sources (e.g., roads, highways, railroad lines, busways, airports), and other specialized sources (e.g., sporting facilities). The model takes into account the reference sound pressure levels of the noise sources at 50 feet, attenuation with distance, ground contours, reflections from barriers and structures, attenuation due to shielding, etc. The CadnaA model is based on the acoustic propagation standards promulgated in International Standard ISO 9613-2. This standard is currently under review for adoption by the American National Standards Institute (ANSI) as an American Standard. The CadnaA model is a state-of-the-art tool for noise analysis and is approved for construction noise level prediction by the *CEQR Technical Manual*.

Geographic input data used with the CadnaA model included CAD drawings that defined site work areas, adjacent building footprints and heights, locations of streets, and locations of sensitive receptors. For each analysis period, the geographic location and operational characteristics—including equipment usage rates (percentage of time operating at full power) for each piece of construction equipment operating at the project site, as well as noise control measures—were input to the model. In addition, reflections and shielding by barriers erected on the construction site, and shielding from both adjacent buildings and project buildings as they are constructed, were accounted for in the model. In addition, construction-related vehicles were assigned to the adjacent

roadways. The model produced A-weighted $L_{eq(1)}$ noise levels at each receptor location for each analysis period, as well as the contribution from each noise source.

DETERMINATION OF NO ACTION AND NON-CONSTRUCTION NOISE LEVELS

Noise generated by construction activities is added to noise generated by non-construction traffic on adjacent roadways in order to determine the total noise levels at each receptor location. No Action levels would be expected to be similar to existing noise levels in the study area, because no substantial increases in traffic are predicted to occur in the No Action condition. Consequently, existing noise levels were conservatively used as the baseline noise levels for determining construction-generated noise level increases. Existing noise levels at the analysis receptors were determined by:

- Performing noise measurements at various at-grade locations;
- Calculating noise levels at the receptor sites and measurement locations using the CadnaA model with existing site geometry and existing traffic on adjacent roadways as inputs;
- Determining adjustment factors based on the difference between the measured and calculated existing noise levels at the measurement locations; and
- Applying the adjustment factors to the calculated existing noise levels at the construction noise receptors.

ANALYSIS PERIODS

As described above, construction activities are expected to take place over a period of about 19 years (i.e., from 2014 through 2032). Except for unusual circumstances construction activities would occur on weekdays only. Therefore, construction noise analyses were performed only for the weekday periods.

A qualitative analysis of Phases 1A and 1B was performed, but the quantitative construction noise analysis focused on Phase 2 of the proposed project, lasting from 2028 through 2032, which is the Phase of the project whose construction would be most likely to result in significant construction noise impacts. Anticipated construction schedule and durations for this Phase were developed by Hunter Roberts Construction Group, an experienced New York City construction manager, and are representative of the reasonable worst-case conditions for assessing potential impacts. The schedule included projections of the number of workers, types and number of pieces of equipment, and number of construction vehicles anticipated to be operating during each month of the Phase 2 construction period. An analysis was performed based on this construction schedule to determine the months during the Phase 2 construction period (i.e., 2028-2032) when the maximum potential for significant noise impacts would occur. This analysis conservatively assumed that the worst-case month of each year would represent the entire year, and the year was modeled according to its peak month. In addition, to be conservative, the noise analysis assumed that both peak on-site construction activities and peak construction-related traffic conditions occurred simultaneously.

NOISE REDUCTION MEASURES

Construction at the project site would be required to follow the requirements of the New York City Noise Control Code (NYC Noise Code) for construction noise control measures. Specific noise control measures will be described in a noise mitigation plan required under the NYC Noise Code. These measures could include a variety of source and path controls.

Willeys Point Development

In terms of source controls (i.e., reducing noise levels at the source or during the most sensitive time periods), the following measures would be implemented in accordance with the NYC Noise Code:

- Equipment that meets the sound level standards specified in Subchapter 5 of the New York City Noise Control Code would be utilized from the start of construction. **Table 20-19** shows the noise levels for typical construction equipment and the mandated noise levels for the equipment that would be used for construction of the proposed project.

Table 20-19
Typical Construction Equipment Noise Emission Levels (dBA)

Equipment List	NYCDEP & FTA Typical Noise Level at 50 feet ¹	Noise Level with Noise Control Measures at 50 feet ²
Compressors	58	
Concrete Pump	82	
Crane (Crawler Cranes)	85	
Cranes (Tower Cranes)	85	
Delivery Trucks	84	
Dump Trucks	84	
Excavator	85	
Generators	82	72
Hand Tool	59	
Hoist	75	
Lift	85	
Pile Driving Rig (Impact)	95	85
Notes:

² Path controls include portable noise barriers, enclosures, acoustical panels, and curtains, whichever are feasible and practicable.		
³ Source: Kessler, Frederick M., "Noise Control for Construction Equipment and Construction Sites," report for Hydro Quebec.		

- As early in the construction period as logistics will allow, diesel- or gas-powered equipment would be replaced with electrical-powered equipment such as welders, water pumps, bench saws, and table saws (i.e., early electrification) to the extent feasible and practicable.
- Where feasible and practicable, construction sites would be configured to minimize back-up alarm noise. In addition, all trucks would not be allowed to idle more than three minutes at the construction site based upon New York City Local Law, unless necessary for construction operations.
- Contractors and subcontractors would be required to properly maintain their equipment and mufflers.
- A properly secured impact cushion (either a commercially available model or one fabricated from scrap wood, leather, or rubber at the job site) would be installed on top of piles that are being driven by an impact hammer.

In terms of path controls (e.g., placement of equipment, implementation of barriers or enclosures between equipment and sensitive receptors), the following measures for construction, which go beyond typical construction techniques, would be implemented to the extent feasible and practical:

- Where logistics allow, noisy equipment, such as cranes, concrete pumps, concrete trucks, and delivery trucks, would be located away from and shielded from sensitive receptor locations. Once building foundations are completed, delivery trucks would operate behind construction fence, where possible.
- Noise barriers constructed from plywood or other materials would be utilized to provide shielding (e.g., the construction sites would have a minimum 8-foot barrier during Phase 1A

construction and a minimum 16-foot barrier during Phase 1B and Phase 2 construction, and, where logistics allow, truck deliveries would take place behind these barriers once building foundations are completed).

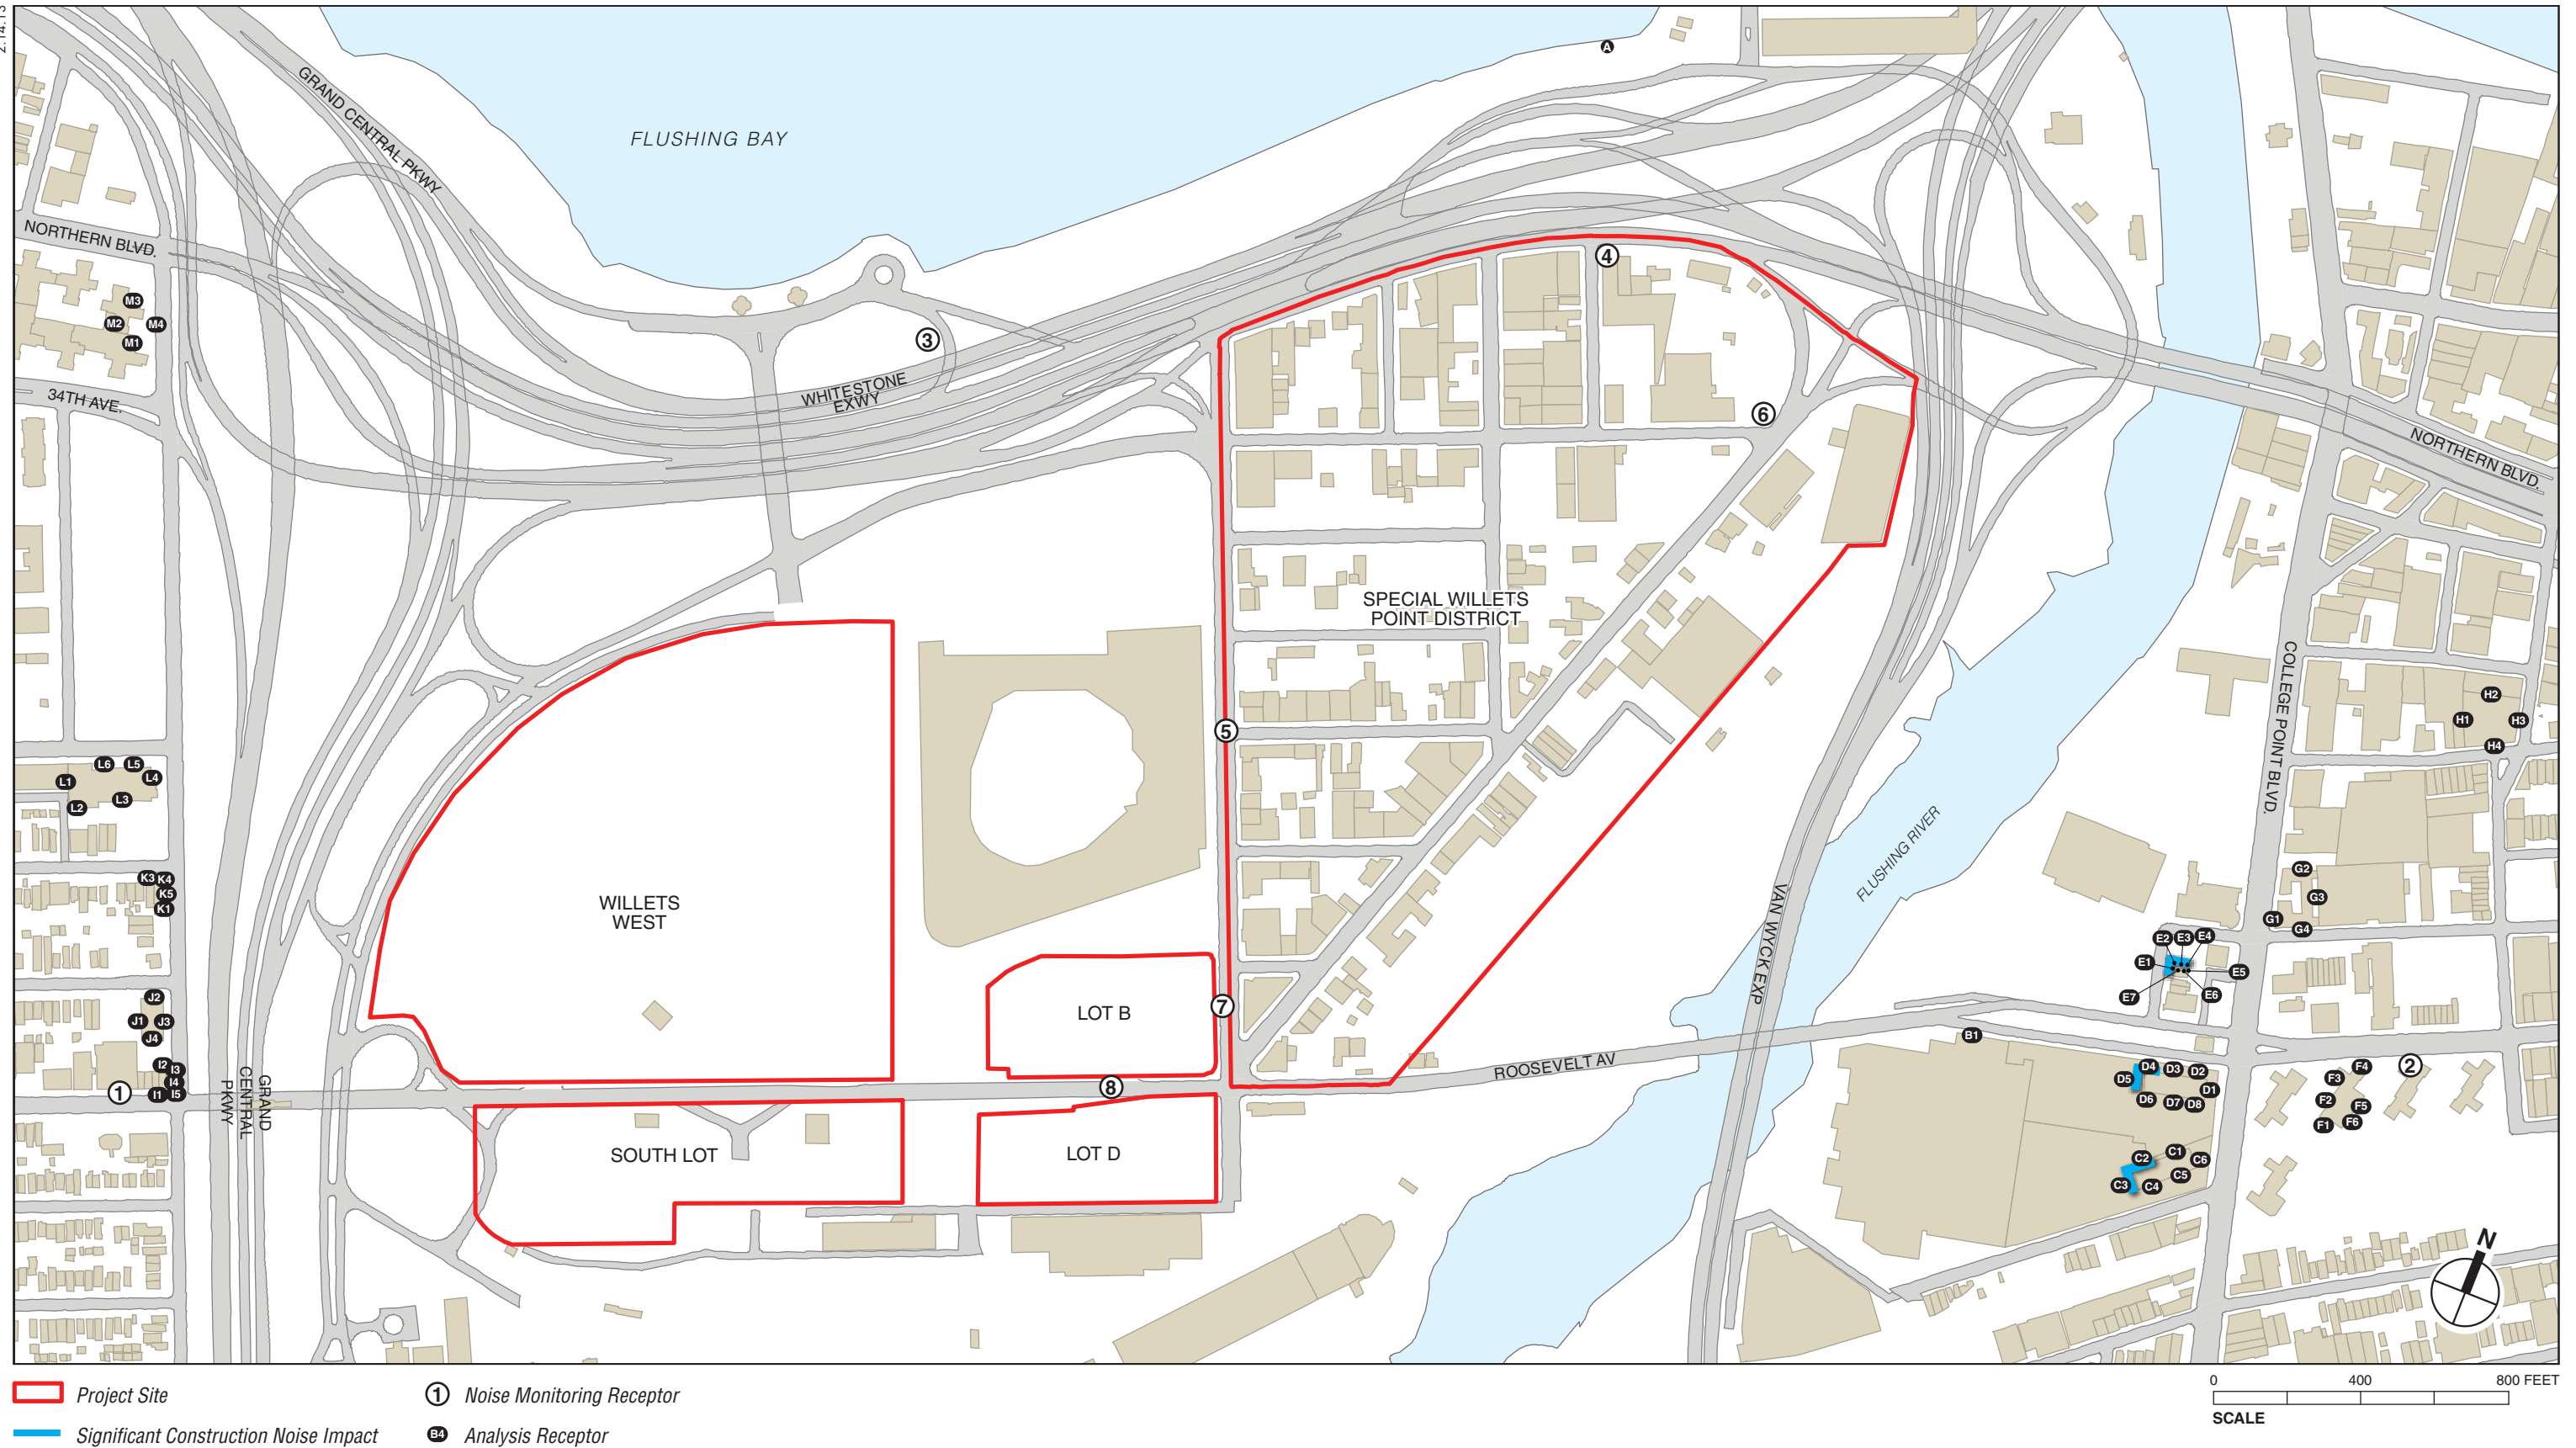

- During Phase 1B and Phase 2 construction, path noise control measures (i.e., portable noise barriers, panels, enclosures, and acoustical tents, where feasible) would be used for impact pile drivers and generators used on site. These path control measures were conservatively assumed to offer only a 10 dBA reduction in noise levels for each piece of equipment to which they are applied, as shown in **Table 20-19**. The details to construct portable noise barriers, enclosures, tents, etc. are based upon the instructions of NYCDEP Citywide Construction Noise Mitigation.

RECEPTOR SITES

Eight (8) noise measurement locations (i.e., sites 1 to 8) were selected to determine the baseline existing noise levels, and fourteen (14) receptor locations (i.e., sites 1 to 14) close to the project area were selected as discrete noise receptor sites for the construction noise analysis. These receptors were either located directly adjacent to the project site or streets where construction trucks would pass. Each receptor site was the location of a residence or other noise-sensitive use. At some buildings, multiple building façades were analyzed. At high-rise buildings, noise receptors were selected at multiple elevations. At open space locations, receptors were selected at street level. **Figure 20-7** shows the locations of the 16 noise receptor sites, and **Table 20-20** lists the noise receptor sites and the associated land use at each site. The receptor sites selected for detailed analysis are representative of other noise receptors in the immediate project area and are the locations where maximum project impacts due to construction noise would be expected.

Table 20-20
Noise Receptor Locations

Receptor	Location	Associated Land Use
1	Roosevelt Avenue between 114th Street and 111th Street	Residential/Commercial
2	Roosevelt Avenue between College Point Boulevard and Prince Street	Residential

Construction Noise Analysis Receptors
Figure 20-7

CONSTRUCTION NOISE ANALYSIS RESULTS

Cumulative Analysis

Using the methodology described above, and considering the noise abatement measures for source and path controls specified above, cumulative noise analyses were performed to determine maximum one-hour equivalent ($L_{eq(1)}$) noise levels that would be expected to occur during each year of construction.

The noise analysis results in **Appendix E** show that predicted noise levels due to construction-related activities would result in increases in noise levels that would exceed the CEQR impact criteria during one or more years at three (3) of the fourteen (14) receptor sites.

The noise analysis results show that predicted noise levels would not exceed the CEQR impact criteria for two or more consecutive years on one or more floors at any of the fourteen (14) receptor sites. (Additional details of the construction analysis are presented in **Appendix E**).

The conceptual schedule on which the noise analysis was based assumes a compressed and conservative potential timeline for construction that tended to show the most construction activity and most construction equipment operating simultaneously, which conditions would result in the largest increase in noise levels at the nearby receptors. Actual construction activities may take place over a longer time period, and result in lower noise levels than those predicted for the worst-case conditions analyzed.

Construction During Phase 1A of the Proposed Project

Phase 1A construction includes construction on parcels within the District as well as the Willets West parcel, and parking lot parcels south of Roosevelt Avenue. However, the construction on each parcel is generally of very short duration. Construction of the retail building on the Willets West parcel would be the longest duration construction of any of the parcels included in Phase 1A. It is also the parcel nearest to the sensitive receptor locations west of 114th Street.

Based on the results of the detailed analysis of Phase 2 construction, the demolition, excavation and foundation phases of the construction period were determined to generate the most noise, especially during the times when pile drivers and excavators would be operating on site. Phase 1A construction does not include the additional noise controls, including higher site-perimeter noise barriers (which would tend to shield excavators from receptors) and additional path controls on impact pile drivers that would be used for Phases 1B and 2. While the full duration of construction on the Willets West parcel is 31 months, the most noise-intensive construction activities (demolition/excavation/foundation work) would last only approximately 16 months (as shown in the conceptual schedule in **Appendix E**).

Based on the results of the detailed analysis of Phase 2 construction, maximum $L_{eq(1h)}$ noise levels at the nearby receptors during this period would be expected to be in the low 70s dBA range, which may result in some exceedances of the *CEQR Technical Manual* noise impact criteria at these locations. However, the duration of these exceedances would be less than 24 consecutive months. So, while the resulting noise level increases may be perceptible and intrusive, they would not be considered “long-term” or significant according to CEQR criteria.

Furthermore, there is a long distance between the Willets West parcel and the receptors west of 114th Street and the Grand Central Parkway, which generates high levels of traffic noise, runs in between the Willets West parcel and the receptors west of 114th Street. Because of these factors, the magnitudes of the noise level increments at the nearby receptors resulting from construction on the Willets West parcel, while they may result in some exceedances of the *CEQR Technical*

Manual noise impact criteria, would not be large enough to disrupt quality of life at these receptors during their limited durations.

Construction at other parcels included in Phase 1A of the proposed project would occur over even shorter durations, and would be located even further from sensitive receptor locations. Consequently, Phase 1A construction in its entirety would not be expected to result in any significant adverse noise impacts.

Construction During Phase 1B of the Proposed Project

Construction of Phase 1B of the proposed project would occur within the District, similarly to the Phase 2 construction. Additionally, Phase 1B construction would utilize all of the same noise control measures included in the detailed analysis of Phase 2 construction, and would include a comparable or smaller amount of construction equipment to that of the Phase 2 construction. Consequently, the conclusions of the detailed analysis of Phase 2 would be applicable to the Phase 1B construction as well, and Phase 1B construction would not be expected to result in any significant adverse noise impacts.

Noise Levels During Construction at Locations Included in the Proposed Project

Proposed buildings that would be completed and occupied before construction is completed at other project building sites, including buildings included in Phase 1B and buildings included in Phase 2 that are completed and occupied before the completion of construction of Phase 2, would also experience elevated exterior noise levels due to ongoing construction activities associated with the proposed project. During the Phase 2 construction periods, these project noise receptors would experience $L_{10(1)}$ noise levels due to construction ranging from 73.4 dBA to 83.6 dBA. These noise levels would result in increments up to 8.6 dBA, comparing noise levels during construction to the noise levels at these receptors without construction. The highest predicted construction noise levels at these receptors are based on the modeling of the worst-case hour of the worst-case quarters of construction and would occur only when the most intense construction activities, such as excavation and foundation work, are underway at immediately adjacent buildings. As shown in **Figure 20-3**, these particularly loud construction tasks at each Phase 2 building parcel would last not longer than six to ten months, and consequently the highest construction noise levels would not be expected to occur at any one building façade for longer than that amount of time. Additionally, the receptors included in the proposed project would include building façades providing not less than 31-43 dBA of attenuation, and alternate means of ventilation (i.e., air conditioners) that do not degrade the acoustical performance of the façade, which would result in acceptable interior noise levels at these receptors during much of the construction period. However, noise levels during construction may exceed 45 dBA $L_{10(1)}$ (the CEQR acceptable interior noise level criteria for residential uses) when the most intense construction activities (including excavation and foundation work), which could result in noise levels in excess of 80 dBA for limited periods of time, would occur immediately adjacent to buildings whose façades provide 35 dBA or less of attenuation. The predicted noise level increments at these receptors, while in excess of CEQR noise impact thresholds, would be noticeable, but would not necessarily result in disruption to quality of life at these receptors. As a result of the relatively small predicted construction noise increments, the short duration of the most intense construction noise adjacent to any one building façade, and the high levels of attenuation provided by project building facades, proposed buildings that would be completed and occupied before construction is completed at other project building sites, including buildings included in Phase 1B and buildings included in Phase 2 that are completed and occupied before the completion of construction of Phase 2, would experience perceptible noise impacts during ongoing construction of Phase 2, but would not experience significant adverse impacts requiring mitigation.

On-site, construction activities would produce $L_{10(1)}$ noise levels at open space areas up to approximately 70 dBA, which would exceed the levels recommended by CEQR for passive open spaces (55 dBA L_{10}). (Noise levels in these areas exceed CEQR recommended values for existing and No Action conditions.) While this is not desirable, there is no effective practicable mitigation¹ that could be implemented to avoid these levels during construction. Noise levels in many parks and open space areas throughout the city, which are located near heavily trafficked roadways and/or near construction sites, experience comparable and sometimes higher noise levels, and consequently such levels would not be considered a significant adverse impact.

VIBRATION

Introduction

Construction activities have the potential to result in vibration levels that may in turn result in structural or architectural damage, and/or annoyance or interference with vibration-sensitive activities. In general, vibratory levels at a receiver are a function of the source strength (which in turn is dependent upon the construction equipment and methods utilized), the distance between the equipment and the receiver, the characteristics of the transmitting medium, and the construction of the receiver building. Construction equipment operation causes ground vibrations that spread through the ground and decrease in strength with distance. Vehicular traffic, even in locations close to major roadways, typically does not result in perceptible vibration levels unless there are discontinuities in the roadway surface. With the exception of the case of fragile and possibly historically significant structures or buildings, generally construction activities do not reach the levels that can cause architectural or structural damage, but can achieve levels that may be perceptible in buildings close to a construction site. An assessment has been prepared to quantify potential vibration impacts of construction activities on structures and residences near the project site.

Construction Vibration Criteria

For purposes of assessing potential structural or architectural damage, the determination of a significant impact was based on the vibration impact criterion used by LPC of a peak particle velocity (PPV) of 0.50 inches/second. For non-fragile buildings, vibration levels below 0.60 inches/second would not be expected to result in any structural or architectural damage.

For purposes of evaluating potential annoyance or interference with vibration-sensitive activities, vibration levels greater than 65 vibration decibels (VdB) would have the potential to result in significant adverse impacts if they were to occur for a prolonged period of time.

Analysis Methodology

For purposes of assessing potential structural or architectural damage, the following formula was used:

$$PPV_{\text{equip}} = PPV_{\text{ref}} \times (25/D)^{1.5}$$

where: PPV_{equip} is the peak particle velocity in in/sec of the equipment at the receiver location;
 PPV_{ref} is the reference vibration level in in/sec at 25 feet; and
 D is the distance from the equipment to the received location in feet.

¹ Noise barriers would not be practicable because of security concerns.

For purposes of assessing potential annoyance or interference with vibration sensitive activities, the following formula was used:

$$L_v(D) = L_v(\text{ref}) - 30\log(D/25)$$

where: $L_v(D)$ is the vibration level in VdB of the equipment at the receiver location;
 $L_v(\text{ref})$ is the reference vibration level in VdB at 25 feet; and
D is the distance from the equipment to the receiver location in feet.

Table 20-21 shows vibration source levels for typical construction equipment.

Table 20-21
Vibration Source Levels for Construction Equipment

Equipment	PPV _{ref} (in/sec)	Approximate L _v (ref) (VdB)
Pile Driver (Impact)	0.644-1.518	104-112
Pile Driver (Sonic)	0.170-0.734	93-105
Clam Shovel drop (slurry wall)	0.202	94
Hydromill (slurry wall in rock)	0.017	75
Vibratory Roller	0.210	94
Hoe Ram	0.089	87
Large bulldozer	0.089	87
Caisson drilling	0.089	87
Loaded trucks	0.076	86
Jackhammer	0.035	79
Small bulldozer	0.003	58

Construction Vibration Analysis Results

The buildings and structures of most concern with regard to the potential for structural or architectural damage due to vibration are the buildings included in the proposed project that would be completed while construction occurs on an adjacent parcel. However, vibration levels at all of these buildings and structures would be well below the 0.50 inches/second PPV limit, and—being new structures—these buildings would not be particularly susceptible to structural or architectural damage due to vibration. At all other locations, the distance between construction equipment and receiving buildings or structures is large enough to avoid vibratory levels that would approach the levels that would have the potential to result in architectural or structural damage.

In terms of potential vibration levels that would be perceptible and annoying, the pieces of equipment that would have the most potential for producing levels that exceed the 65 VdB limit are pile drivers. They would produce perceptible vibration levels (i.e., vibration levels exceeding 65 VdB) at receptor locations within a distance of approximately 230 feet. However, the operation would only occur for limited periods of time at a particular location and, therefore, resulting from the proposed project would not result in any significant adverse impacts. In no case are significant adverse impacts from vibrations expected to occur.

OTHER TECHNICAL AREAS

HISTORIC AND CULTURAL RESOURCES

As described in Chapter 7, consistent with the findings in the 2008 FGEIS, construction activities related to the development that would occur within the District during Phase 2 of the proposed project would be anticipated to result in the demolition of the former Empire Millwork

Willets Point Development

Corporation Building, which was found by OPRHP to be eligible for listing on the State and National Registers of Historic Places (S/NR). Demolition of this structure would be considered a significant adverse effect on this architectural resource.

Retaining the former Empire Millwork Corporation Building would be challenging from a site grading and engineering perspective. The District is below the Federal Emergency Management Agency (FEMA) 100-year floodplain level of 14 feet above mean sea level (AMSL), and up to seven feet of fill would be required in some locations to grade and raise the entire District to an elevation of between 14 and 17 feet AMSL. If the City were to provide new infrastructure—including new roadways, sidewalks, and storm and sanitary sewer lines—at the existing grade, potential future development could be subject to flooding on the lower floors. As such, the City plans to raise the District and require that any new development be raised above the 100-year floodplain level. The site of the former Empire Millwork Corporation Building would require up to 3.4 feet of fill to conform to the future grade of the District.

As the former Empire Millwork Corporation Building is at the District's existing grade and located near the Flushing Bay inlet, it is presumed that it is subject to flooding on the lower floors and would remain so in the future without the proposed project. If the former Empire Millwork Corporation Building were not raised it would be significantly more vulnerable to flooding, both because it is below AMSL, and because the surrounding topography would be raised, directing water runoff into lower areas. Raising the grade in a majority of the District while maintaining the existing grade on the former Empire Millwork Corporation Building site would require special engineering measures to protect the building during site preparation and construction to prevent future flooding on the site, and to visually and functionally integrate the building with the rest of the District despite the differences in grade.

In a letter dated May 30, 2008, OPRHP stated that the demolition of the former Empire Millwork Corporation Building would constitute an adverse impact, and that all alternatives to demolition have not been explored. The substantial challenges inherent in retaining the former Empire Millwork Corporation Building as part of the proposed project are detailed above. Furthermore, as the structure would remain under private ownership in the No Action condition, it could be demolished as-of-right in that scenario, and mitigation measures such as photographic documentation would not be required. Retention of the structure also would not advance the goals and objectives of the approved Willets Point Development Plan, including the improvement of environmental conditions and the development of affordable housing, community facilities, and public open space.

A developer for Phase 2 has not yet been selected, and QDG may or may not be selected as the designated developer for Phase 2. Before the development of Phase 2, the selected developer will consult with OPRHP and LPC to evaluate any remaining potential alternatives to demolition. If none are identified, measures to mitigate this adverse impact have been or will be developed, as discussed in Chapter 21, "Mitigation." As discussed in the 2008 FGEIS, these would include consultation with OPRHP to develop mitigation measures, such as recording the building through a Historic American Buildings Survey (HABS)-level photographic documentation and accompanying narrative.

HAZARDOUS MATERIALS

Consistent with the conclusions of the 2008 FGEIS and subsequent technical memoranda, the proposed project would not result in significant adverse impacts related to hazardous materials during construction.

Consistent with the Staged Acquisition Alternative analyzed in the 2008 FGEIS as well as the Adjusted Plan and Updated Plan analyzed in subsequent technical memoranda, the proposed project would phase remediation and redevelopment of the District. Construction of Phase 1A of the proposed project would commence with the remediation to standards appropriate for multi-family residences of an approximately 23-acre portion of the District and involve the construction of hotel, retail, and interim surface parking/recreational uses in this area. The interim uses would be developed on an impermeable surface. Remediation of areas to be developed in Phase 1A would be completed prior to 2018. Construction activities involving the remediation of the portion of the District not already redeveloped in Phases 1A and 1B to standards appropriate for multi-family residences is assumed to be completed prior to 2028, and thus before the commencement of construction of the Phase 2 development.

To avoid the potential for significant adverse impacts related to hazardous materials, the proposed project would include appropriate health and safety (e.g., dust control and air monitoring) and investigative/remedial (e.g., delineating and excavating contaminated soils and disposing of them off site at an appropriately licensed facility) measures that would precede or govern both demolition and soil disturbance activities. These measures would be conducted in compliance with all applicable laws and regulations and would conform to appropriate engineering practices. Also, given that some subsurface contamination would likely remain after completion of construction (e.g., historical fill materials underlying the development area) and in nearby areas that would not be cleaned up until a subsequent phase of development, new development would require engineering controls, which could include capping to prevent exposure to underlying soils, groundwater controls at construction site boundaries, and vapor barriers with active or passive sub-slab depressurization systems beneath enclosed or occupied buildings (e.g., not open parking structures). As development of the District is contemplated to occur in phases, excavation and cleanup during Phase 1B and Phase 2 would occur near already developed buildings and uses, requiring stringent controls on construction dust and other potential sources of contaminant migration. Institutional controls would be used to ensure the investigations and remedial measures would be implemented along with requirements to prevent future exposure during intrusive work and subsurface utility repairs at developed sites. Specifically, these institutional controls would be the existing E designations (possibly supplemented by additional requirements should any lots enroll in the BCP) for the District, and restrictions added to the proposed lease amendments or development agreements for the remainder of the project site.

The institutional controls would require the project sponsor, prior to seeking or obtaining DOB permits associated with redevelopment, conduct Phase I and Phase II ESAs (to the extent they have not already been conducted), and complete necessary remediation (with appropriate construction-related HASPs) either prior to or as a part of site development, to the satisfaction of (for the District) the New York City Office of Environmental Remediation (OER) or (for lots outside of the District) DEP. Should all or portions of the District be entered into the BCP, this State program would entail similar requirements to OER's (which would not be superseded). The BCP is a voluntary program in which a property owner/developer enters into an agreement with the State to conduct investigation and remediation in accordance with a variety of requirements, including public participation. Following the cleanup, with, if required, the implementation of deed restrictions to ensure the performance of institutional and engineering controls, the State issues a Certificate of Completion indicating cleanup has been achieved consistent with the proposed site use. It is not anticipated that cleanup requirements of the State and City would differ substantively. Likely components of site remediation and other measures

Willeys Point Development

to avoid impacts are essentially unchanged from those described in Chapter 12 of the 2008 FGEIS, i.e., they would include:

- Procedures for pre-demolition removal of asbestos and appropriate management of LBP and PCB-containing equipment.
- Additional subsurface investigation, both within the District and of areas not yet investigated, to better characterize soils to be removed for excavation.
- Development of a CHASP and Site Management Plan (SMP) for site remediation, excavation, and redevelopment that would include detailed procedures for managing both known contamination issues (e.g., tank removal, and soil and groundwater remediation of existing petroleum spills, excavation, and removal of existing septic tanks or fields, floor drains, and historic fill) and any unexpectedly encountered contamination issues. The CHASP would also include procedures for avoiding the generation of dust that could affect the surrounding community (especially at later-phase sites neighboring already developed sites), as well as the monitoring necessary to ensure that no such impacts occur.
- Prevention of contaminant migration to a particular development site from other properties might entail the use of various forms of groundwater flow controls at construction site boundaries and/or vapor barriers and sub-slab venting systems could be incorporated into the foundations of new buildings to prevent remaining subsurface contaminated vapors from entering buildings. Procedures that are instituted would be consistent with applicable laws and regulations.

Institutional controls (specifically, E designations, BCP requirements, or restrictions added to leases or development agreements) would be used to ensure required post-development procedures (e.g., implementation of health and safety procedures during subsurface utility repair) would be implemented. Methods for guaranteeing the continued effectiveness of these controls would include periodic (e.g., annual) certification and reporting requirements.

Contamination in the subsurface (including petroleum contamination) within the District has been identified through limited Phase II ESAs. This contamination is likely related primarily to the District's current and historical automotive-related businesses. Although detailed investigations have not yet been performed at the other portions of the project site, less extensive contamination has been found and is anticipated to be encountered, with levels (including elevated methane levels) expected to be consistent with the area's historical ash filling. In addition to subsurface contamination, asbestos-, LBP-, and PCB-containing equipment are likely to be present inside existing buildings.

With the implementation of the variety of measures described above, not only would no significant adverse impacts related to hazardous materials be expected to occur as a result of construction of the proposed project, but the proposed project, with its associated extensive cleanup which would otherwise likely not occur at all or only much more slowly, would result in significant potential benefits to public health and the environment. To ensure the various required measures would be implemented, they would be made binding on all site developers through conditions in the project documents. Although some hazardous materials would likely remain in the subsurface following construction of the proposed project, with the building vapor control measures outlined above, there would be no exposure pathways and thus no further potential for significant adverse impacts. Thus, consistent with the conclusions of the 2008 FGEIS and subsequent technical memoranda, the proposed project would not result in significant adverse impacts related to hazardous materials.

OPEN SPACE

Consistent with the 2008 FGEIS and subsequent technical memoranda, this analysis finds that the proposed project would not result in any significant adverse construction impacts with respect to open space.

Construction of the proposed project would not remove or alter any existing publicly accessible open spaces, and construction of the proposed project would not change the use of any existing publicly accessible open space on the project site or in the study area. Construction of the proposed project also would not limit access to area parks or other publicly accessible open space resources in the vicinity of the proposed project.

Phase 1A construction of the Willets West portion of the proposed project would occupy 30.7 acres of the surface parking lot west of CitiField, as well as one of the CitiField parking lots along Roosevelt Avenue (South Lot). While this land is mapped as parkland, it does not function as open space. The land was formerly occupied by Shea Stadium and associated parking and circulation space until the stadium was replaced by CitiField in 2009, and it is now occupied exclusively by surface parking. Therefore, construction of portions of the proposed project on this mapped parkland would have no direct effect on the use or adequacy of open space for the study area residential and non-residential populations during construction. While it is anticipated that some of the trees within the Willets West portion of the project site would require removal during construction, as would trees within the Lot B area, tree replacement would be conducted in conformance with DPR requirements. Construction of the Phase 1B and Phase 2 portions of the proposed project to be constructed by 2028 and 2032, respectively, also would have no direct effect on the use or adequacy of open space for the study area residential and non-residential populations during construction. Furthermore, throughout the course of the proposed project's construction, substantial new open spaces would be introduced (some temporary), and study area residents would continue to have access to the portions of Flushing Meadows-Corona Park and the Flushing Bay Promenade that are outside of the proposed project's boundaries.

However, because Phase 2 construction activities on Parcels A12, A13, A14, A17, and A18 of the project site would occur immediately adjacent to the new public park on Parcel A16 (anticipated to be complete and open by early 2029), special measures would be taken to prevent construction activities intrusion into this new public park. Similarly, Phase 2 construction activities on Parcels A15, A17, A18, and A19 would occur immediately adjacent to new passive open spaces on Parcels A20, A22, and A23 (anticipated to be completed by early 2032). In each case, a solid fence would be erected along the perimeter of the site that borders the new park or open spaces. The fence would have no openings between the construction site and the new park or open spaces and would be high enough to reduce sound from construction activity from these building sites, to the extent practicable, and to minimize dust. The hoists, cranes, and other equipment would be located on the side of the building sites away from the new park or open spaces, to the extent practicable. As the various building superstructures are being erected, netting would be installed on the side of the buildings facing the new park or open spaces to prevent any materials from falling into the new park or open spaces.

Construction activities would be conducted with the care mandated by the close proximity of an open space to the project site. Dust control measures—including watering of exposed areas and dust covers for trucks—would be implemented to ensure compliance with the New York City Air Pollution Control Code, which regulates construction-related dust emissions. As discussed below, there would be no significant adverse air quality impacts on open spaces.

However, as described in the Noise section of this chapter, at limited times some project site and study area public and private open spaces (including some of the new private open spaces being constructed as part of the proposed project) would experience project-related short-term significant noise impacts from activities such as excavation and foundation construction. These activities would generate noise that could impair the enjoyment of nearby public open space users; however, because of the temporary nature of these impacts, and their short duration (in all cases less than 9 months), these would not be considered significant.

SOCIOECONOMIC CONDITIONS

Consistent with the 2008 FGEIS and subsequent technical memoranda, this analysis finds that the proposed project would not result in any significant adverse construction impacts with respect to socioeconomic conditions.

Construction could, in some instances, temporarily affect pedestrian and vehicular access on street frontages immediately adjacent to the proposed project's various building sites or the areas of the other project elements. However, lane and/or sidewalk closures are expected to be of very limited duration, and are not expected to occur in front of entrances to any existing or planned retail businesses, construction activities would not obstruct major thoroughfares used by customers or businesses, and businesses would not be significantly affected by any temporary reductions in the amount of pedestrian foot traffic or vehicular delays that could occur as a result of construction activities, because of the maintenance and protection of traffic (MPT) measures required by NYCDOT. Utility service would be maintained to all businesses, although very short-term interruptions (i.e., hours) may occur when new equipment (e.g., a transformer, or a sewer or water line) is put into operation. Overall, construction resulting from the proposed project is not expected to result in any significant adverse impacts on surrounding businesses.

Construction would create major direct benefits resulting from expenditures on labor, materials, and services, and indirect benefits created by expenditures by material suppliers, construction workers, and other employees involved in the direct activity.

COMMUNITY FACILITIES

Consistent with the conclusions of the 2008 FGEIS, construction of the proposed project would not result in any significant adverse impacts on community facilities and services, including libraries; health care facilities; and police and fire protection facilities.

No community facilities are located within the project site. Therefore, construction of the proposed project would not have a significant adverse impact on community facilities. Construction activities related to the proposed project would not physically displace or alter any existing community facilities. No study area community facilities would be directly affected by construction activities for an extended duration. The analysis of potential indirect effects on schools finds that the proposed project would not result in any significant adverse impacts on high schools. For Phase 1B, QDG would coordinate with the School Construction Authority (SCA) to determine whether the public school space currently planned as part of Phase 1B would be sufficient to accommodate all of the elementary and intermediate school children generated by the proposed project by 2028. For Phase 2, the New York City Economic Development Corporation (EDC) would require as part of the developer's agreement that the designated developer similarly coordinate with SCA. If necessary, the school spaces would be expanded, and corresponding reductions in square footage would be made elsewhere in the development program.

The construction of the proposed schools on Parcel A8 (during Phase 1B) and Parcel A6 (during Phase 2), as well as ongoing project construction effects on the school located on Parcel A8 once it is operational, are discussed in this chapter. The construction sites adjacent to the school on Parcel A8 would be surrounded by construction fencing and barriers that would limit the effects of construction on this facility. Similarly, the proposed convention center construction site on Parcel A19, adjacent to the school on Parcel A6 would be surrounded by construction fencing and barriers that would limit the effects of construction on this facility.

Construction workers would not place any burden on public schools and would have minimal, if any, demands on libraries, child care facilities, and health care. Construction of the proposed buildings and the other project elements would not block or restrict access to any facilities in the area, and would not materially affect emergency response times. New York Police Department (NYPD) and Fire Department (FDNY) emergency services and response times would not be materially affected as a result of the geographic distribution of the police and fire facilities and their respective coverage areas.

NATURAL RESOURCES

As discussed in detail in Chapter 9, “Natural Resources,” and consistent with the findings of the 2008 FGEIS and subsequent technical memoranda, construction of the proposed project would not result in significant adverse impacts to groundwater, floodplains, water quality, aquatic biota, wetlands, terrestrial natural resources, threatened or endangered species, or essential fish habitat (EFH) within and near the project site.

Willeys West, the South Lot, and Lots B and D are within the current 100-year floodplain, the level of which is projected to increase as a result of climate change, as discussed in more detail in Chapter 9, “Natural Resources.” Most of the District is also within the 100 year floodplain, with the exception of three areas located in the northwest, along the eastern border and along Roosevelt Avenue that are within the 500-year floodplain. Thus in some locations, particularly within the District, new fill would be required during construction of the proposed project to grade and raise the project site structures above the 100-year flood elevation, consistent with the New York City Building Code.¹ Changes to the grade elevation are expected to occur in phases, as construction of the proposed project progresses. During Phase 1A the majority of the project site will remain at the existing grade and only the hotel and commercial spaces would be built at a higher grade above the floodplain elevation. The remainder of the extent of Phase 1A and 1B would be raised above the 100-year flood elevation during the initial stages of construction for Phase 1B. Those grade changes will either occur through bringing in new fill and constructing retaining walls or by building atop basements that raise the finished floor height above the floodplain elevation. Grade transitions would be created between the new streets in Phase 1B and the existing street grades that would remain in the Phase 2 area until that area is raised, most likely during the initial stages of construction for Phase 2. Because the 100-year floodplain within and adjacent to the study area is affected by coastal flooding (rather than local or fluvial flooding) as a result of astronomic tide and meteorological forces, flooding conditions in the

¹ As specified in Appendix G: “Flood Resistant Construction” of the *New York City Building Code*¹ for the applicable building category (see Table 1604.5 of the *New York City Building Code* or Table 1-1 of Appendix G to the *New York City Building Code*), and revisions to these requirements prior to construction.

Willets Point Development

project site and surrounding area would not be affected by construction or regrading/filling that would occur as part of the RWCDS.

The project site is more than 180 feet away from the nearest NYSDEC-mapped tidal wetland and more than 165 feet away from the nearest U.S. Fish and Wildlife Services (USFWS) NWI-mapped wetland. As described in the 2008 FGEIS, NYSDEC and NWI-mapped wetlands would not be impacted as a result of construction of the proposed project within the District, and Lots B and D. Similarly, because there are no wetlands present within Willets West or the South Lot, construction of the RWCDS would not adversely affect wetland resources. Therefore, adverse impacts on NYSDEC or USFWS mapped wetlands from construction activities are not expected.

Measures to protect existing trees would include protection plans to minimize impacts to the critical root zones, trunks, and canopies. The potential loss of trees and the existing “terrestrial cultural” ecological communities within the project site, which are common to the New York metropolitan area, would not result in significant adverse impacts to vegetation resources within the region.

Site preparation activities and construction of the RWCDS would generate noise and anthropogenic activity. However, impacts to wildlife would be minimal because wildlife within the study area consists of urban-adapted, highly disturbance-tolerant species. The species of wildlife in the area are ubiquitous throughout the city and commonly inhabit areas with extensive levels of human disturbance and degraded habitat conditions. Wildlife occurring in the area would not be expected to be significantly impacted by the noise and other anthropogenic disturbances generated by project construction.

As discussed in Chapter 10, “Hazardous Materials,” management of wastes generated during project construction related to the cleanup and redevelopment of the project site will be conducted in accordance with applicable federal, state, and local regulatory requirements and with oversight of New York City regulatory agencies. As a result, the proposed project would have the potential to have a direct benefit to soils of the study area. Therefore, consistent with the conclusions in the 2008 FGEIS, construction of the RWCDS would not result in direct or indirect adverse impacts to soils of the study area.

As discussed in Chapter 10, “Hazardous Materials,” a CHASP and SMP for site remediation, excavation, and redevelopment would be developed and would include detailed procedures for managing known contamination issues (e.g., tank removal, and soil and groundwater remediation of existing petroleum spills, excavation, and removal of existing septic tanks or fields, floor drains, and historic fill), as well as any unexpectedly encountered contamination issues during construction. As a result, the proposed project would have the potential to result in a net benefit to groundwater of the study area. Thus, consistent with the conclusions of the 2008 FGEIS and subsequent technical memoranda, the proposed project would not result in significant adverse impacts related to groundwater quality.

No in-water construction activities would result from the construction of the RWCDS. Soil disturbing activities associated with construction all phases of the RWCDS would be conducted in accordance with the NYSDEC State Pollutant Discharge Elimination System (SPDES) General Permit for Stormwater Discharges from Construction Activity (GP-0-10-001). Erosion and sediment control measures to be implemented during construction activities would be specified in the stormwater pollution prevention plan (SWPPP). With the implementation of these measures, stormwater discharged through the existing stormwater outfalls would not result in significant adverse impacts to water quality and aquatic biota of Flushing Bay. Additionally,

with implementation of the proposed site remediation (detailed in Chapter 10, “Hazardous Materials”) construction and operation of the RWCDs would reduce the potential for contaminants to enter Flushing Bay and the Flushing River, thereby having the potential to improve the water quality of these waterbodies.

No in-water construction would take place in Flushing Creek and Flushing Bay as a result of the RWCDs. Therefore, the sediments of Flushing Creek and Flushing Bay would not be impacted during the construction or operation of the proposed project. Furthermore, the dredging plans for Flushing Bay, as proposed by DEP and as part of the U.S. Army Corps of Engineers’ (USACE) navigational channel clearance maintenance, would not be impacted by the construction or operation of the proposed project.

As discussed in the 2008 FGEIS and in Chapter 9, “Natural Resources,” no federally- or state-listed species or ecological communities are known to occur within the study area nor is habitat present. Therefore, consistent with the conclusions of the 2008 FGEIS, construction of the RWCDs would not result in adverse impacts to federally- and state-listed species.

As discussed above, no significant adverse impacts to aquatic biota are expected as a result of construction of the proposed project. Construction would not occur within Flushing Bay or Flushing Creek. Therefore, consistent with the conclusions of the 2008 FGEIS, construction of the RWCDs would not result in significant adverse impacts to EFH.

LAND USE

Consistent with the 2008 FGEIS and subsequent technical memoranda, construction of the proposed project would not be expected to result in any significant adverse impacts to land use.

Construction activities resulting from the proposed project would affect land use within the District and on the Willets West, South Lot, Lot D and Lot B sites, but would not alter surrounding land uses. Because the District is isolated from the surrounding uses by the Flushing River, the Whitestone Expressway, the Van Wyck Expressway, and Northern Boulevard, construction is expected to have no significant adverse effects on the surrounding areas. As is typical with construction projects, during periods of peak construction activity there would be some disruption, predominantly noise, to the nearby area. There would be construction trucks and construction workers coming to the various sites. There would also be noise, sometimes intrusive, from building construction as well as trucks and other vehicles backing up, loading, and unloading. These disruptions would be temporary in nature and would have limited effects on land uses within the study area, particularly as most construction activities would take place within each of the building sites, existing surface parking lots, areas of the other project elements, or within portions of sidewalks, curbs, and travel lanes of public streets immediately adjacent to these sites. Throughout construction, access to any remaining or new surrounding residences, businesses, and institutions in the area would be maintained. In addition, measures would be implemented to control noise, vibration, emissions, and dust on construction sites, including the erection of construction fencing incorporating sound-reducing measures. Overall, while the construction at the various building sites and areas of the other project elements within the project site would be evident to the local community, the limited duration of construction at each of the proposed project’s building sites and the areas of the other project elements, coupled with the project site’s isolation from the neighboring community by the Flushing River, the Whitestone Expressway, the Van Wyck Expressway, and Northern Boulevard, construction of the proposed project would not result in significant or long-term adverse impacts on local land use patterns or the character of the nearby area.

RODENT CONTROL

Construction contracts for the various RWCDs building sites (Willets West, Parcels A1-A15, A17-A19, and Lot B) and areas of the other proposed project elements—open spaces, public park (Parcel A16), surface and structured parking (South Lot and Lot D), and infrastructure improvements—would include provisions for a rodent (mouse and rat) control program, as standard construction practice. Before the start of construction at any given Phase or development parcel within the project site, construction contractors would survey and bait the appropriate areas and provide for proper site sanitation. During construction, as necessary, the contractors would carry out a maintenance program. Coordination would be maintained with appropriate public agencies. Only EPA- and NYSDEC-registered rodenticides would be utilized, and the contractors would be required to perform rodent control programs in a manner that avoids hazards to persons, domestic animals, and non-target wildlife. *

A. INTRODUCTION

The preceding chapters of this Draft Supplemental Environmental Impact Statement (DSEIS) discuss the potential for significant adverse environmental impacts to result from the proposed project and potential future development on Lot B. Such potential impacts were identified in the areas of historic resources, community facilities, transportation, and construction. Measures have been examined to minimize or eliminate these anticipated impacts. These mitigation measures are discussed below. This chapter also discusses the potential effect of traffic mitigation measures on air quality and noise.

B. COMMUNITY FACILITIES AND SERVICES

As discussed in Chapter 4, “Community Facilities and Services,” the analysis of potential indirect effects on library services finds that the holdings per resident ratio for the combined study area would decrease from 3.03 under the No Action condition to 2.80 with the proposed project in 2032. This ratio would decrease to 5.02 for the Flushing Library and to 0.69 for the Corona Library. For both the Flushing Library and Corona Library, the catchment area population increase would exceed five percent, which may represent a significant adverse impact on library services according to the *CEQR Technical Manual*. However, as noted above, many of the residents in the catchment areas also reside within the catchment areas for other nearby libraries and would also be served by these libraries, residents of the study area would have access to the entire Queens Library system through the inter-library loan system, and would also have access to libraries near their places of work. In consideration of the above, the lead agency, in consultation with the Queens Public Library, has determined that the additional population introduced by the proposed project would impair the delivery of library services in the study area in 2032. Therefore, Phase 2 of the proposed project would result in a significant adverse impact on library services. To mitigate this impact, adequate space¹ within the 125,000 square feet of as-yet-unprogrammed community facility space in the program for Phase 2 would be made available to ~~could potentially~~ be utilized as a branch library or auxiliary facility for the Queens Library system, or additional volumes or programs to accommodate new users could be provided if adequate space in nearby branches exists. Although no developer has yet been designated for Phase 2, the provision of additional library space in Phase 2 would be based on further consultation with Queens Public Library and the lead agency.

As discussed in Chapter 4, the analysis of indirect effects on child care facilities finds that the proposed project may result in significant adverse impacts on publicly funded child care facilities in 2028. Therefore, consistent with the conclusions of the 2008 FGEIS, to mitigate the potential impact on child care facilities that could occur by 2028, the Queens Development

¹ In other projects, 15,000–20,000 square feet of community facility space has been adequate for the operation of a branch library.

Group (i) would consult with ACS to determine the appropriate way to meet demand for child care services generated by ~~development on the proposed project~~; and (ii) would, as directed by ACS, add capacity to existing facilities or provide a new child care facility within or near the area surrounding the project site. To mitigate the potential impact on child care facilities that could occur by 2032, EDC would require, as part of the developer's agreement, that the designated developer of Phase 2 consult with the New York City Administration for Child Services (ACS) to determine the appropriate way to meet demand for child care services generated by development in the District by 2032 and would, as directed by ACS, add capacity to existing facilities or provide a new child care facility within or near the area surrounding the project site.

Possible mitigation measures, which would be implemented by the developer(s) of Phase 1B and Phase 2, include adding capacity to existing facilities or providing a new child care facility within or near the area surrounding the project site. At this point, however, it is not possible to know exactly which type of mitigation would be most appropriate and when, because several factors may limit the number of children in need of publicly funded child care slots. Families in the study area could make use of alternatives to publicly funded child care facilities, such as homes licensed to provide family child care which families of eligible children could elect to use instead of a public child care center. In addition, parents of eligible children may use ACS vouchers to finance care at private child care centers either within the study area or could use facilities outside of study area.

C. HISTORIC AND CULTURAL RESOURCES

As discussed in Chapter 7, "Historic and Cultural Resources," there are substantial challenges inherent in retaining the historic building located in the District—the Former Empire Millwork Corporation Building—and the proposed project contemplates demolition of this building in Phase 2. A developer for Phase 2 has not yet been selected, and the Queens Development Group may or may not be selected as the designated developer for Phase 2. Before the development of Phase 2, the selected developer will consult with the New York State Office of Parks, Recreation and Historic Preservation (OPRHP) and the New York City Landmarks Preservation Commission (LPC) to evaluate any remaining potential alternatives to demolition. If none are identified, measures to mitigate this adverse impact would be developed in consultation with OPRHP and LPC. The mitigation measures could include recording the building through a Historic American Buildings Survey (HABS)-level photographic documentation and accompanying narrative.

D. TRAFFIC AND PARKING

As discussed in Chapter 14, "Transportation," the proposed project would result in significant adverse traffic impacts at many locations within the study area. The sections below identify the mitigation that may be needed at each location for each phase of development and provide descriptions of mitigation findings at the intersections analyzed and within the highway network. A separate section is then provided describing implementation of the mitigation measures. ~~The effectiveness and feasibility of proposed mitigation measures will be further assessed between the draft and final SEIS.~~ Detailed LOS tables are presented at the end of the chapter.

TRAFFIC—PHASE 1A (2018)

Table 21-1 presents a summary of significant adverse traffic impacts and their ability to be mitigated, and **Table 21-2** summarizes the unmitigated traffic study area locations by time period. Details of the intersection capacity results and traffic mitigation measures are provided in tables at the back of the chapter.

<u>Northern Boulevard at 126th Place</u>							

Notes: "X" means the intersection would be unmitigated in the corresponding peak hour

The overall finding of the traffic mitigation analysis is that the majority of locations analyzed under the proposed project would be significantly impacted, and that a broad range of mitigation measures would be needed. Depending on the peak hour, approximately one-half or more of the significantly impacted locations could be fully or partially mitigated with traffic signal operation changes, such as signal phasing and/or timing changes, signalization of an unsignalized intersection, lane re-striping, parking prohibitions, or turn prohibitions (i.e., the prohibition of right turns from southbound College Point Boulevard at Roosevelt Avenue, the prohibition of left turns from westbound Roosevelt Avenue at College Point Boulevard, and the prohibition of left turns from westbound Northern Boulevard at 114th Street).

Three locations—including 126th Street at Northern Boulevard, 126th Street/Grand Central Parkway (GCP) ramp at 34th Avenue, and the GCP exit ramp at West Park Loop/Stadium Road—would require special, more intensive mitigation measures to mitigate the significant impacts in all peak hours. This more intensive mitigation is explained in detail in the following sections. The locations that were fully or partially mitigated during any of the seven peak analysis hours are listed below:

~~The overall finding of the traffic mitigation analysis is that the majority of locations analyzed under the proposed project would be significantly impacted, and that a broad range of mitigation measures would be needed. Depending on the peak hour, approximately one-half or more of the significantly impacted locations could be fully or partially mitigated with traffic signal operation changes, such as signal phasing and/or timing changes, signalization of an unsignalized intersection, lane re-striping, parking prohibitions, or turn prohibitions (i.e., the prohibition of right turns from southbound College Point Boulevard at Roosevelt Avenue, the prohibition of left turns from westbound Roosevelt Avenue at College Point Boulevard, and the prohibition of left turns from westbound Northern Boulevard at 114th Street).~~

~~Three locations—including 126th Street at Northern Boulevard, 126th Street/Grand Central Parkway (GCP) ramp at 34th Avenue, and the GCP exit ramp at West Park Loop/Stadium Road—would require special, more intensive mitigation measures to mitigate the significant impacts in all peak hours. This more intensive mitigation is explained in detail in the following sections. The locations that were fully or partially mitigated during any of the seven peak analysis hours are listed below:~~

- 108th Street at Astoria Boulevard
- 108th Street at Northern Boulevard
- 114th Street at Northern Boulevard
- 126th Street at Northern Boulevard
- Union Street at Northern Boulevard
- Parsons Boulevard at Northern Boulevard
- 114th Street at 34th Avenue
- 126th Street/GCP Ramp at 34th Avenue
- 108th Street at Roosevelt Avenue
- 111th Street at Roosevelt Avenue
- 114th Street at Roosevelt Avenue
- 126th Street at Roosevelt Avenue
- College Point Boulevard at Roosevelt Ave
- Prince Street at Roosevelt Avenue
- Main Street at Roosevelt Avenue
- Parsons Boulevard at Roosevelt Avenue
- Main Street at Kissena Boulevard
- Parsons Boulevard at Sanford Avenue
- Boat Basin Road at Stadium Road
- Boat Basin Road at World's Fair Marina
- GCP Ramp at West Park Loop/Stadium Road

The following intersections could only be partially mitigated or could not be mitigated at all during the following time periods:

- In the weekday non-game AM peak hour, 114th Street at Roosevelt Avenue would be partially mitigated and there would be two unmitigatable intersections—Union Street at Roosevelt Avenue, and Prince Street at Northern Boulevard.
- In the non-game weekday midday peak hour, College Point Boulevard at Roosevelt Avenue would be partially mitigated, and three intersections including the Northern Boulevard intersections at Prince Street and at Main Street, and the intersection of Union Street at Roosevelt Avenue could not be mitigated.
- In the non-game weekday PM peak hour, College Point Boulevard at Roosevelt Avenue would be partially mitigated, and four intersections including 108th Street at Astoria Boulevard, the Northern Boulevard intersections at Prince Street and at Main Street, and the intersection of Union Street at Roosevelt Avenue could not be mitigated.
- In the non-game Saturday midday peak hour, College Point Boulevard at Roosevelt Avenue would be partially mitigated, and three intersections including the Northern Boulevard intersections at Prince Street and at Main Street, and the intersection of Union Street at Roosevelt Avenue could not be mitigated.
- In the weekday pre-game peak hour, 126th Street/GCP Ramp at 34th Avenue, College Point Boulevard at Roosevelt Avenue, and Boat Basin Road at Stadium Road would be partially mitigated, and ~~five~~ seven intersections could not be mitigated, including 108th Street at Astoria Boulevard, the Northern Boulevard intersections at Prince Street and at Main Street, ~~and~~ the Roosevelt Avenue intersections at 126th Street and at Union Street, and the 126th Street intersections at 36th and 37th Avenues.
- In the Saturday pre-game peak hour, 126th Street/GCP Ramp at 34th Avenue, 108th Street at Roosevelt Avenue, 114th Street at Roosevelt Avenue, and 126th Street at Roosevelt Avenue College Point Boulevard at Roosevelt Avenue could be partially mitigated, and ~~three~~ five intersections could not be mitigated, including Prince Street at Northern Boulevard, ~~and~~ the Roosevelt Avenue intersections at 126th Street and at Union Street, and the 126th Street intersections at 36th and 37th Avenues.
- In the Saturday post-game peak hour, there would be ~~three~~ five partially mitigated intersections—126th Street at Northern Boulevard, 126th Street/GCP Ramp at 34th Avenue, 114th Street at Roosevelt Avenue, 126th Street at Roosevelt Avenue, and College Point Boulevard at Roosevelt Avenue, ~~and Boat Basin Road at Stadium Road~~—and ~~three~~ five intersections could not be mitigated, including the Northern Boulevard intersections at Prince Street and at Main Street, ~~and~~ the intersection of Union Street at Roosevelt Avenue, and the 126th Street intersections at 36th and 37th Avenues.

A summary of the traffic mitigation findings for each analysis location, including the proposed mitigation measures where applicable, is provided below.

ASTORIA BOULEVARD

The analyzed intersection at 108th Street would be significantly impacted during the non-game weekday PM, weekday pre-game and weekend post-game peak hours. The impacts on the northbound de-facto left turn lane on 108th Street and on the eastbound Astoria Boulevard approach could not be mitigated during the non-game PM and weekday pre-game peak hours. Signal timing modifications at this intersection would not be possible without creating new significant impacts, and geometric modifications to improve capacity would not be feasible, except during the weekend post-game peak hour, where the impact on the westbound left turn lane on Astoria Boulevard could be fully mitigated by modifying the signal timing plan.

NORTHERN BOULEVARD

~~All seven~~ Seven of the eight intersections analyzed along Northern Boulevard would be significantly impacted during the non-game weekday PM, weekday pre-game arrival and weekend post-game departure peak hours. Six of the ~~seven eight~~ intersections analyzed along Northern Boulevard would be significantly impacted during the non-game weekday AM and midday peak hours and the Saturday midday peak hour, and ~~five six~~ would be significantly impacted during the pre-game Saturday midday arrival peak hour.

Northern Boulevard at 108th Street

This intersection would be significantly impacted during all non-game and game day peak hours. This intersection could be fully mitigated by installing “No Standing Anytime” regulations along the east curb and west curb of the northbound and southbound approaches, respectively, for 250 feet from the intersection to allow for two moving lanes, restriping the southbound approach of 108th Street from one 23-foot-wide lane to one 11-foot-wide exclusive left-turn lane and one 12-foot-wide shared through-right lane for 175 feet, and modifying the signal timing plan in all seven time periods.

Northern Boulevard at 114th Street

Mitigation would not be necessary during the non-game weekday and Saturday midday peak hours. Significant adverse impacts would be ~~partially mitigated during the Saturday post-game departure peak hour and~~ fully mitigated during all other peak hours ~~the Saturday pre-game and non-game Saturday midday peak hours~~ by modifying the signal timing plan and by ~~monitoring the westbound Northern Boulevard traffic conditions by Traffic Enforcement Agents (TEAs) who can manually override the traffic signal timing patterns to improve traffic operation for intersection approaches experiencing congestion during the Saturday post-game peak hour. In order to fully mitigate significant impacts in all peak hours, in addition to the signal timing changes, other mitigation measures would include prohibition of~~ prohibiting left turns from westbound Northern Boulevard and diverting them to southbound 114th Street, ~~prohibition of prohibiting~~ parking along the west east side of southbound 114th Street and lane restriping restriping the southbound 114th Street approach as two 11-foot-wide travel lanes and the receiving lanes as two 11-foot-wide moving lanes with parking on both sides.

Northern Boulevard at 126th Street

This intersection would be significantly impacted during all seven peak hours ~~except during the Saturday pre-game peak hour~~. Significant impacts expected on the northbound 126th Street approach and on westbound Northern Boulevard (leading to the intersection from the Van Wyck and Whitestone Expressway off-ramps) could be fully mitigated in all non-game peak hours and during the weekday and Saturday pre-game peak hours and partially mitigated in the Saturday post-game peak hour by modifying the signal timing plan in addition to more intensive measures discussed below, and by having TEAs monitor traffic conditions (i.e., manually override the traffic signal timing patterns to improve traffic operation for intersection approaches experiencing congestion) on the northbound approach. None of the significant impacts expected during the remaining analysis peak hours could be mitigated by applying the above mentioned mitigation measures. Because this intersection is the convergence point of Northern Boulevard, 126th Street, and two highway exit ramps, it would carry significant project-generated traffic volumes. Under existing conditions, consistently long queues are experienced on the westbound Northern Boulevard approach, especially the lane adjacent to the north curb, which receives the traffic volume from the southbound Whitestone Expressway and the northbound Van Wyck

Expressway exit ramps. One of the mitigation measures at 126th Street/GCP Ramp at 34th Avenue includes closure of the eastbound Northern Boulevard ramp to 126th Street and diversion of traffic through this intersection to 126th Place. Therefore, In order to fully mitigate the significant impacts during all seven peak hours, this intersection would require additional cost intensive mitigation measures including installation of quick curb (i.e., plastic reflective pylons used for channelizing the traffic) Jersey barriers and traffic signal louvers (used on traffic signals to avoid confusion on two closely spaced intersection approaches where approaching motorists may be able to see the signal indication for another approach) on the westbound approach between the right-most lane and the center lane to allow Van Wyck and Whitestone Expressway ramp traffic to operate as free flow through the intersection, plus widening the westbound Northern Boulevard approach by shifting the north and south curbs to allow for a 15-foot-wide right-most lane, modification of signal timing, widening of the eastbound Northern Boulevard approach from two 12-foot-wide lanes to three 10-foot-wide lanes, prohibiting pedestrian crossing in the east crosswalk, channelizing the northbound left-turn lanes to allow for smoother turns onto westbound Northern Boulevard, and implementation of signal timing changes needed to coordinate the northbound 126th Street approach with the upstream signal at the intersection of 126th Street and 34th Avenue.

Northern Boulevard at 126th Place

Significant impacts are not expected during any of the analysis peak hours. However, a traffic signal would be installed to allow pedestrians to cross safely from the south side of Northern Boulevard to the proposed MTA bus stop in the median of Northern Boulevard.

Northern Boulevard at Prince Street

None of the significant impacts expected during the seven analysis peak hours could be mitigated. With impacts occurring on the Northern Boulevard approaches, the geometric complexity and signal timing characteristics of this intersection, ~~there is limited~~ limit opportunity for mitigation.

Northern Boulevard at Main Street

Mitigation would not be required during the weekday non-game AM peak hour and the Saturday pre-game arrival peak hour. Significant impacts during the other five peak hours could not be mitigated.

Northern Boulevard at Union Street

This intersection would be significantly impacted during all non-game and game day peak hours with significant impacts expected on eastbound Northern Boulevard during the non-game weekday AM and midday peak hours and the Saturday post-game peak hour, and on both eastbound and westbound Northern Boulevard during the non-game weekday PM, Saturday midday, weekday pre-game, and the Saturday pre-game peak hours. Installing “No Standing 7 AM–10 PM” regulations along the north curb of the westbound Northern Boulevard approach 200 feet from the intersection to allow for one 10-foot-wide daylighted shared through-right lane, and signal timing adjustments, could fully mitigate significant impacts in all seven peak hours.

Northern Boulevard at Parsons Boulevard

This intersection would be significantly impacted during all non-game and game day peak hours. Installing “No Standing Anytime” regulations along the south side of eastbound Northern Boulevard, north side of westbound Northern Boulevard, and west side of southbound Parsons

Willetts Point Development

Boulevard and signal timing adjustments during the non-game weekday AM and PM, and weekday pre-game peak hours could fully mitigate significant impacts in all seven time periods.

34TH AVENUE

The intersection of 34th Avenue at 126th Street (and the Grand Central Parkway and eastbound Northern Boulevard ramps) would be significantly impacted during all seven peak hours since the intersection would be a key gateway to the District. The other intersection, 34th Avenue at 114th Street, would be significantly impacted during all seven peak hours except the non-game weekday AM peak hour.

34th Avenue at 114th Street

Significant impacts are expected during all seven peak hours except the non-game weekday AM peak hour, which could be fully mitigated by modifying the signal timing plan.

34th Avenue at 126th Street

Significant impacts are expected during all seven analysis peak hours. As a key entrance point to the District, this intersection would carry significant volumes of project generated traffic. Its geometric complexity, with approaches from two exit ramps in addition to the 126th Street northbound and 34th Avenue eastbound and westbound approaches, limits traditional capacity improvement options. ~~Signal timing changes would fully mitigate the significant adverse impacts only during the weekday AM peak hour, but would only partially mitigate impacts during the remaining six peak hours.~~ To fully mitigate significant impacts during all non-game peak hours six of the seven and partially mitigate significant impacts during the game day time periods, this intersection would require cost intensive mitigation measures including closure of the existing slip ramp from GCP/Astoria Boulevard eastbound Northern Boulevard to 126th Street and ~~combining it with the existing ramp from eastbound Northern Boulevard to 126th Street~~ diverting traffic to 126th Place, striping the proposed ~~combined~~ widened GCP/Astoria Boulevard ramp as one ~~12-foot-wide shared left through lane~~ 11-foot-wide left-turn lane and two 11-foot-wide through lanes, ~~one 12-foot-wide exclusive through lane, and one 12-foot-wide exclusive right turn lane~~, constructing a channelized right-turn from the GCP/Astoria Boulevard ramp to westbound Shea Road (upstream of the intersection), ~~signalization of the intersection of the Northern Boulevard ramp at GCP/Astoria Boulevard ramp (which currently operates as an unsignalized intersection)~~ widening the westbound 34th Avenue approach to two 11-foot-wide travel lanes and two 11-foot-wide receiving lanes, restriping the northbound 126th Street approach from two 11-foot-wide travel lanes, one 12-foot-wide travel lanes and one 7-foot-wide hatched median to one 12-foot-wide exclusive left-turn lane, two 12-foot-wide travel lanes, and one 5-foot-wide Class II bicycle lane, and modifying the existing signal timing plan.

ROOSEVELT AVENUE

All nine intersections would be significantly impacted during the seven analysis peak hours, except for the intersection of Roosevelt Avenue at 108th Street during the weekday AM peak hour, the intersection at 111th Street during the weekday AM and midday peak hours, the intersection at Prince Street during the weekday midday, non-game Saturday midday and all game day peak hours, the intersection at Main Street during the non-game weekday midday and Saturday pre-game peak hours, and the intersection at Parsons Boulevard during the weekday midday and PM peak hours, and the Saturday pre-game and post-game peak hours. In each time period, the intersection of Roosevelt Avenue at Union Street would be unmitigatable. The intersection of Roosevelt Avenue at College Point Boulevard could be fully mitigated during the non-game weekday AM peak hour and

partially mitigated during the ~~non-game weekday midday, PM and Saturday midday~~ other six peak hours, ~~and during the Saturday post-game peak hour~~. The intersection of Roosevelt Avenue at 126th Street could be partially mitigated during ~~all game day~~ the Saturday post-game peak hours ~~and would be unmitigatable during the weekday and Saturday pre-game peak hours~~, and the intersection at 108th Street could be partially mitigated during the Saturday pre-game arrival peak hour. Limited mitigation options for the Roosevelt Avenue corridor would be possible, due in part to limited space for travel lanes and critical curbside activities, including bus stops, bus layover, and truck loading/unloading, and columns supporting the No. 7 subway line.

Roosevelt Avenue at 108th Street

Significant impacts would occur in all peak hours except during the non-game weekday AM peak hour and could be fully mitigated (except during the Saturday pre-game peak hour when it would be only partially mitigated) by providing “No Standing Anytime” parking regulations within 150 feet of the intersection on the east side of northbound 108th Street and the west side of southbound 108th Street, to allow for one 11-foot-wide left-through lane and one 11-foot-wide right-turn lane.

Roosevelt Avenue at 111th Street

Significant impacts would occur in all peak hours except during non-game weekday AM and midday peak hours and could be fully mitigated by providing “No Standing 10 AM–10 PM” parking regulations within 100 feet of the intersection on the north side of the westbound Roosevelt Avenue approach, to allow for one 11-foot-wide left-through lane and one 10-foot-wide right-turn lane.

Roosevelt Avenue at 114th Street

Significant impacts would occur in all seven peak hours. These impacts could be partially mitigated during the non-game weekday AM and Saturday pre- and post-game peak hours and could be fully mitigated during the remaining four peak hours by shifting the centerline of the southbound 114th Street approach two feet to the east, installing “No Standing Anytime” regulations along the west curb of the southbound 114th Street approach 150 feet from the stop bar to allow for one 12-foot-wide shared left-through lane and one 10-foot-wide right-turn lane, installing “No Standing Anytime” regulations along the south curb of the eastbound Roosevelt Avenue approach 150 feet from the stop bar to allow for one 11-foot-wide left-turn lane and one 11-foot-wide shared through-right lane, shifting the centerline of the westbound Roosevelt Avenue approach eleven feet to the south, and restriping the westbound Roosevelt Avenue approach as one 11-foot-wide left-turn pocket (250 feet long), one 11-foot-wide through lane, and one 11-foot-wide right-turn lane (upstream of the intersection, Roosevelt Avenue would continue to operate as two lanes in each direction). In addition to the above mitigation measures, signal timing changes would be necessary to fully or partially mitigate expected significant impacts during all game and non-game peak hours except during the non-game weekday AM and midday peak hours.

Roosevelt Avenue at 126th Street

Significant impacts would occur in all seven peak hours. These impacts could be fully mitigated during all non-game peak hours, and could be partially mitigated in the Saturday post-game peak hour by restriping the southbound 126th Street approach as one 12-foot-wide right-turn lane and one 11-foot-wide shared left-through lane, and by implementing a new signal phasing and timing plan. The significant impacts that occur during the weekday and Saturday pre-game peak hours could not be mitigated.

Roosevelt Avenue at College Point Boulevard

Significant impacts would occur in all seven peak hours. These impacts could be fully mitigated during the non-game weekday AM peak hour, ~~weekday pre-game and Saturday pre-game peak hours~~, and could be partially mitigated in the remaining ~~four~~ six peak hours. Measures necessary for the full or partial mitigation of the significant impacts include ~~geometric changes~~, signal phasing and timing plan changes, turn prohibitions, limited prohibition of parking, and pavement restriping. ~~The geometry of the east leg of the intersection would be changed by removing the 22-foot wide center median and replacing it with a 9-foot wide tapered hatched median between the proposed 13-foot wide westbound left turn pocket and the westbound through-right lanes. The westbound Roosevelt Avenue through-right travel lanes would be restriped from one 13-foot-wide travel lane and one 17-foot-wide travel lane to one 11-foot-wide two 15-foot-wide travel lanes and one 19-foot-wide travel lane for 80 feet. Left turns from westbound Roosevelt Avenue to southbound College Point Boulevard would be prohibited and diverted to Janet Place and 39th Avenue.~~ The northbound College Point Boulevard approach would be restriped from one 9-foot-wide exclusive left-turn lane, one 13-foot-wide travel lane, and one 18-foot-wide travel lane with parking to ~~one two~~ two 10-foot-wide exclusive left-turn lanes, ~~and two 10-foot-wide through travel lanes, and one 10-foot wide exclusive right turn lane~~ for 200 feet. The southbound College Point Boulevard approach would be restriped from one 11-foot-wide travel lane and one 19-foot-wide travel lane to three 10-foot-wide travel lanes for 200 feet. The eastbound Roosevelt Avenue approach would be restriped from one 14-foot-wide travel lane and one 12-foot-wide travel lane to two 13-foot-wide travel lanes. Parking prohibitions at this location include installing “No Standing Anytime” regulations along the east curb of the northbound approach of College Point Boulevard for 250 feet and installing “No Standing Anytime” regulations along the west curb of the southbound approach of College Point Boulevard for 200 feet. Southbound right-turn traffic on College Point Boulevard would be diverted to 39th Avenue and Janet Place. Signal phasing and timing plan would be modified.

Roosevelt Avenue at Prince Street

Significant impacts would occur during the non-game weekday AM and PM peak hours and could be fully mitigated by ~~shifting the center line of the eastbound Roosevelt Avenue approach 6 feet to the north, restriping the eastbound Roosevelt Avenue approach from one 11-foot wide travel lane and one 19-foot wide travel lane with parking to one 11-foot wide exclusive left turn lane, one 11-foot wide travel lane, one 6-foot wide hatched buffer, and one 8-foot wide parking lane for 250 feet, restriping the receiving side of westbound Roosevelt Avenue from one 9-foot-wide travel lane and one 19-foot wide travel lane to two 11-foot wide travel lanes for 250 feet and modifying the signal phasing and timing plan.~~

Roosevelt Avenue at Main Street

This intersection would be significantly impacted during all ~~seven~~ peak hours except for the non-game midday and Saturday pre-game peak hours and could be fully mitigated by modifying the signal timing plan.

Roosevelt Avenue at Union Street

None of the significant impacts expected during all seven peak hours could be mitigated.

Roosevelt Avenue at Parsons Boulevard

Significant impacts are expected during the non-game weekday AM, Saturday midday and weekday pre-game peak hours. Significant impacts during the non-game weekday AM and

weekday pre-game peak hour could be fully mitigated by prohibiting parking between 7 AM–10 AM and 4 PM–7 PM (Monday through Friday) on the northbound approach 75 feet from the intersection to allow for a 10-foot-wide daylighted right-turn lane and modifying the signal timing. Significant impacts during the Saturday midday peak hour could be fully mitigated by modifying the signal timing.

SANFORD AVENUE

One of the three intersections analyzed along Sanford Avenue, i.e., Parsons Boulevard at Sanford Avenue, would be significantly impacted during the non-game weekday midday peak hour.

Sanford Avenue at College Point Boulevard

Significant impacts are not expected during any of the analysis peak hours.

Sanford Avenue at Union Street

Significant impacts are not expected during any of the analysis peak hours.

Sanford Avenue at Parsons Boulevard

Modifying signal timings would fully mitigate significant impacts expected during the non-game weekday midday peak hour.

OTHER STUDY AREA LOCATIONS

Kissena Boulevard at Main Street

Modifying signal timings would fully mitigate significant impacts during the Saturday midday peak hour.

32nd Avenue at College Point Boulevard

Significant impacts are not expected during any of the analysis peak hours.

World's Fair Marina at Boat Basin Road

Significant impacts would occur in all seven peak hours. Significant impacts at this currently unsignalized intersection could be fully mitigated by installing a traffic signal, operating with a 90-second cycle, to provide sufficient gaps for northbound Boat Basin Road left turn traffic toward the entrance ramp to the westbound Grand Central Parkway, striping the westbound approach as one 11-foot-wide left-turn lane and one 11-foot-wide shared left-through lane, and striping the northbound approach as two 10-foot-wide left-turn lanes and one 10-foot-wide right-turn lane.

Northern Boulevard Service Road at College Point Boulevard

Significant impacts are not expected during any of the analysis peak hours.

Boat Basin Road at Stadium Road

Significant impacts are expected in all peak hours except during the non-game weekday AM and midday peak hours and could be fully mitigated during the non-game weekday PM, Saturday midday, and Saturday pre-game and post-game peak hours, and could be partially mitigated during the weekday pre-game and ~~Saturday post-game~~ peak hours by installing an actuated signal controller and by modifying the signal phasing and timing plan.

Stadium Road at the Grand Central Parkway Ramp

Significant adverse impacts are expected during non-game weekday midday, Saturday midday, weekday pre-game, and Saturday pre-game peak hours, and could be fully mitigated by

Willets Point Development

widening the exit ramp from the westbound GCP to add one travel lane in the diverge/weave area, which would be a channelized right-turn lane at the intersection, and installing a traffic signal with a 120-second cycle length, striping the westbound approach for as two 12-foot-wide left-turn lanes and one 12-foot-wide right-turn lane, and adding a 12-foot-wide southbound left-turn lane in the median of Stadium Road. The new westbound approach exiting the Willets West Center would continue to operate at unacceptable LOS D or LOS E during all peak hours except the non-game weekday AM peak hour.

Willets Point Boulevard at Northern Boulevard

Significant impacts are not expected during any of the analysis peak hours.

~~In addition to the study locations analyzed and reported above, the intersections of 126th Street at 36th Avenue, 126th Street at 37th Avenue, and Northern Boulevard at 126th Place are expected to carry a significant amount of project generated trips in Phase 1A. These three intersections were not analyzed for this Draft SEIS since the majority of project generated trips from the District were assigned to the adjacent analyzed intersections. Since impacts have been identified for these adjacent intersections, the three intersections listed above will be analyzed for the Final SEIS to determine if they would similarly experience significant adverse impacts. If they are found to be significantly impacted under the With Action condition, mitigation measures such as those typically implemented by NYCDOT would be further explored to address the impacts, or if no practicable mitigation measures can be identified, the impacts would be disclosed as being unmitigatable.~~

126th Street at 36th Avenue

Significant impacts are expected during all game day peak hours and would be unmitigatable.

126th Street at 37th Avenue

Significant impacts are expected during all game day peak hours and would be unmitigatable.

TRAFFIC—PHASE 1B (2028)

Table 21-3 presents a summary of significant adverse traffic impacts and their ability to be mitigated, and **Table 21-4** summarizes the unmitigated traffic study area locations by time period. Details of the intersection capacity results and relevant traffic mitigation measures are provided in tables at the back of this chapter.

Table 21-3
Traffic Impact Mitigation Summary—Phase 1B

Intersection	Without a Mets Game				With a Mets Game		
	Weekday AM	Weekday Midday	Weekday PM	Saturday Midday	Weekday Pre-Game PM	Saturday Pre-Game Midday	Saturday Post-Game PM
No Significant Impact	44 14	9 12	8 12	5 9	8 11	40 12	9 10
Fully Mitigated Impact	45 14	42 13	44 9	43 12	42 10	43 12	44 11
Partially Mitigated Impact	1	6 5	6 8	8	7 9	4 5	4 9
Unmitigated Impact	3 4	3	5 4	4	3	3 4	3

Table 21-4
Summary of Unmitigated Intersections—Phase 1B

Intersection	Without a Mets Game				With a Mets Game		
	Weekday AM	Weekday Midday	Weekday PM	Saturday Midday	Weekday Pre-Game PM	Saturday Pre-Game Midday	Saturday Post-Game PM
Astoria Boulevard at 108th Street			X		X		
Northern Boulevard at 108th Street							
Northern Boulevard at 114th Street							
Northern Boulevard at 126th Street						X	
Northern Boulevard at Prince Street	X						X
Northern Boulevard at Main Street	X	X	X	X	X	X	X
Northern Boulevard at Union Street							
Northern Boulevard at Parsons Boulevard

126th Street at 36th Avenue							
126th Street at 37th Avenue							
Northern Boulevard at 126th Place							

Notes: "X" means the intersection would be unmitigated in the corresponding peak hour

The overall finding of the traffic mitigation analysis is that the majority of locations analyzed under the proposed project would be significantly impacted, and that the need for a broad range of mitigation measures would be substantial. As noted above for Phase 1A, depending on the peak hour, approximately one-half or more of the significantly impacted locations could be fully or partially mitigated with the same types of measures described for Phase 1A. The locations that were fully or partially mitigated during any of the seven peak analysis hours are listed below:

- 108th Street at Astoria Boulevard
- 108th Street at Northern Boulevard
- 114th Street at Northern Boulevard
- 126th Street at Northern Boulevard
- Prince Street at Northern Boulevard
- Union Street at Northern Boulevard
- Parsons Boulevard at Northern Boulevard
- 114th Street at 34th Avenue
- 126th Street/GCP Ramp at 34th Avenue
- 108th Street at Roosevelt Avenue
- 111th Street at Roosevelt Avenue

Willetts Point Development

- 114th Street at Roosevelt Avenue
- 126th Street at Roosevelt Avenue
- College Point Boulevard at Roosevelt Avenue
- Prince Street at Roosevelt Avenue
- Main Street at Roosevelt Avenue
- Parsons Boulevard at Roosevelt Avenue
- Main Street at Kissena Boulevard
- Parsons Boulevard at Sanford Avenue
- College Point Boulevard at Northern Boulevard Service Road
- Boat Basin Road at Stadium Road
- Boat Basin Road at World's Fair Marina
- Willetts Point Boulevard at Northern Boulevard
- GCP Ramp at West Park Loop/Stadium Road
- 126th Street at 36th Avenue
- 126th Street at 37th Avenue

The following intersections could only be partially mitigated or could not be mitigated at all during the following time periods:

- In the weekday non-game AM peak hour, there would be ~~three~~ four unmitigatable intersections including Prince Street at Northern Boulevard, Main Street at Northern Boulevard, 126th Street at Roosevelt Avenue, and Union Street at Roosevelt Avenue, and the intersection of Union Street at Northern Boulevard would be partially mitigated.
- In the non-game weekday midday peak hour, there would be three unmitigatable intersections including Main Street at Northern Boulevard, Union Street at Roosevelt Avenue, and Boat Basin Road at Stadium Road, and ~~six~~ five intersections including the Northern Boulevard intersections at 126th Street, at Prince Street, and at Union Street, ~~126th Street/GCP ramp at 34th Avenue~~, 126th Street at Roosevelt Avenue, and College Point Boulevard at Roosevelt Avenue, and Main Street at Roosevelt Avenue would be partially mitigated.
- In the non-game weekday PM peak hour, there would be ~~five~~ four unmitigatable intersections including 108th Street at Astoria Boulevard, Main Street at Northern Boulevard, ~~Main~~ Street at Roosevelt Avenue, Union Street at Roosevelt Avenue, and Boat Basin Road at Stadium Road, and ~~six~~ eight intersections including the Northern Boulevard intersections at 126th Street, Prince Street, Union Street, and Parsons Boulevard, 126th Street/GCP ramp at 34th Avenue, 126th Street at Roosevelt Avenue, and College Point Boulevard at Roosevelt Avenue, and Main Street at Roosevelt Avenue would be partially mitigated.
- In the non-game Saturday midday peak hour, there would be four unmitigatable intersections including Main Street at Northern Boulevard, Union Street at Roosevelt Avenue, Parsons Boulevard at Sanford Avenue, and Boat Basin Road at Stadium Road, and eight intersections including the Northern Boulevard intersections at 126th Street, Prince Street and Union Street, ~~126th Street/GCP ramp at 34th Avenue~~, 111th Street at Roosevelt Avenue, 126th Street at Roosevelt Avenue, College Point Boulevard at Roosevelt Avenue, Main Street at Roosevelt Avenue, and Parsons Boulevard at Roosevelt Avenue would be partially mitigated.
- In the weekday pre-game peak hour, there would be three unmitigatable intersections including 108th Street at Astoria Boulevard, Main Street at Northern Boulevard, and Union Street at Roosevelt Avenue, and ~~seven~~ nine intersections including the Northern Boulevard

- intersections at 126th Street, Prince Street, Union Street, and Parson Boulevard, 126th Street/GCP ramp at 34th Avenue, 126th Street at Roosevelt Avenue, College Point Boulevard at Roosevelt Avenue, Main Street at Roosevelt Avenue, and Boat Basin Road at Stadium Road would be partially mitigated.
- In the Saturday pre-game peak hour, there would be ~~three~~ four unmitigatable intersections including 126th Street at Northern Boulevard, Main Street at Northern Boulevard, Union Street at Roosevelt Avenue, and Boat Basin Road at Stadium Road, and ~~four~~ five intersections including the Northern Boulevard intersections at Prince Street and Union Street, 126th Street/GCP ramp at 34th Avenue, 126th Street at Roosevelt Avenue, and College Point Boulevard at Roosevelt Avenue would be partially mitigated.
 - In the Saturday post-game peak hour, there would be three unmitigatable intersections including Prince and Main Streets at Northern Boulevard, and Union Street at Roosevelt Avenue, and ~~four~~ nine intersections including Northern Boulevard at 126th Street, Northern Boulevard at Union Street, 126th Street/GCP ramp at 34th Avenue, 114th Street at Roosevelt Avenue, 126th Street at Roosevelt Avenue, College Point Boulevard at Roosevelt Avenue, ~~and~~ Main Street at Roosevelt Avenue, 126th Street at 36th Avenue, and 126th Street at 37th Avenue would be partially mitigated.

A summary of the traffic mitigation findings for each analysis location, including the proposed mitigation measures where applicable, is provided below.

ASTORIA BOULEVARD

The analyzed intersection at 108th Street would be significantly impacted during the non-game weekday PM, Saturday midday, weekday pre-game, Saturday pre-game and Saturday post-game peak hours. The impacts on the northbound de-facto left turn lane on 108th Street, and on the eastbound Astoria Boulevard approach could not be mitigated during the non-game weekday PM and weekday pre-game peak hours. Signal timing modifications at this intersection would not be possible without creating new significant impacts, and geometric modifications to improve capacity would not be feasible. The expected significant impacts could be fully mitigated during the Saturday midday, Saturday pre-game and Saturday post-game peak hours by installing “No Standing Saturday 11 AM–10 PM” regulations along the south curb of the eastbound approach for 150 feet from the intersection to allow for an 11-foot-wide daylighted right-turn lane.

NORTHERN BOULEVARD

~~All seven~~ Seven of the eight intersections analyzed along Northern Boulevard would be significantly impacted during all seven peak hours except the intersection of Northern Boulevard at 114th Street in the non-game weekday midday peak hour.

Northern Boulevard at 108th Street

This intersection would be significantly impacted during all non-game and game day peak hours and could be fully mitigated by installing “No Standing Anytime” regulations along the east curb and west curb of the northbound and southbound approaches, respectively, for 250 feet from the intersection to allow for two moving lanes, and restriping the northbound and southbound approaches of 108th Street from one 23-foot-wide lane to one 11-foot-wide exclusive left-turn lane and one 12-foot-wide shared through-right lane for 175 feet. In addition, other measures would be required including modifying the signal timing plan in all peak hours except during the non-game weekday PM peak hour and the weekday pre-game peak hour, and prohibiting parking between 10 AM–9 PM along the north and south curbs of the westbound and eastbound

Willets Point Development

approaches, respectively, for 150 feet from the intersection to allow for a 10-foot-wide daylighted right-turn lane in all peak hours except the non-game weekday AM peak hour.

Northern Boulevard at 114th Street

Mitigation would not be necessary during the non-game weekday midday peak hour. Significant adverse impacts would be ~~only partially mitigated during the non-game weekday AM and Saturday post-game departure~~ fully mitigated during all other peak hours by modifying the signal timing plan and by ~~having TEAs monitor traffic conditions on the westbound Northern Boulevard approach (i.e., manually override the traffic signal to improve traffic operation for intersection approaches experiencing congestion) during the weekend post-game departure peak hour.~~ To fully mitigate all significant impacts during all the seven peak hours and to avoid severely congested conditions, in addition to signal timing modifications, other mitigation measures would be required including prohibition of prohibiting left turns from westbound Northern Boulevard and diverting them to southbound 114th Street, prohibition of prohibiting parking along the west east side of southbound 114th Street and restriping the southbound 114th Street approach as two 11-foot-wide travel lanes and the receiving lanes as two 11-foot-wide moving lanes with parking on both sides.

Northern Boulevard at 126th Street

This intersection would be significantly impacted during all seven peak hours. Significant adverse impacts expected on the northbound 126th Street approach, on eastbound Northern Boulevard, on the eastbound Grand Central Parkway ramp, and on westbound Northern Boulevard (leading to the intersection from the Van Wyck and Whitestone Expressway off-ramps) could be fully mitigated in the weekday ~~pre-game~~ non-game AM peak hour and partially mitigated in ~~the Saturday post-game~~ five of the other six peak hours by modifying the signal timing plan ~~and by having TEAs monitor traffic conditions on the northbound approach (i.e., manually override the traffic signal to improve traffic operation for intersection approaches experiencing congestion).~~ None of the significant impacts expected during the remaining analysis peak hours could be mitigated by applying traditional mitigation measures in addition to more intensive measures discussed below. This intersection is the convergence point of Northern Boulevard, 126th Street, and two highway exit ramps carrying significant project-generated traffic volumes. Under existing conditions, consistently long queues are experienced on the westbound approach, especially the lane adjacent to the north curb, which receives the traffic volume from the southbound Whitestone Expressway and the northbound Van Wyck Expressway exit ramps. One of the mitigation measures at 126th Street/GCP Ramp at 34th Avenue includes closure of the eastbound Northern Boulevard ramp to 126th Street and diversion of traffic through this intersection to 126th Place. Therefore, In order to fully mitigate the significant impacts during all seven peak hours the non-game weekday AM peak hour and partially mitigate the remaining peak hours (except for the Saturday pre-game peak hour), this intersection would require the same east-intensive additional mitigation measures identified for Phase 1A.

Northern Boulevard at 126th Place

Significant impacts are not expected during any of the analysis peak hours. However, a traffic signal would be installed to allow pedestrians to cross safely from the south side of Northern Boulevard to the proposed MTA bus stop in the median of Northern Boulevard.

Northern Boulevard at Prince Street

This intersection would have significant adverse impacts during all seven peak hours, which would be unmitigatable in the non-game weekday AM peak hour and the Saturday post-game

peak hour, and would be partially mitigated in the remaining peak hours by installing “No Standing 10 AM–7 PM” regulations along the north curb of the westbound Northern Boulevard service road for 100 feet from the intersection to allow for one 10-foot-wide through lane and one 10-foot-wide daylighted right-turn pocket, and reducing the width of the hatched median between the service road and mainline from 8 feet to 6 feet.

Northern Boulevard at Main Street

None of the significant impacts expected during all seven peak hours could be mitigated.

Northern Boulevard at Union Street

This intersection would be significantly impacted during all seven peak hours with significant impacts expected on both Northern Boulevard approaches and could be partially mitigated by installing “No Standing 7 AM–10 PM” regulations along the north curb of the westbound Northern Boulevard approach 200 feet from the intersection to allow for one 10-foot-wide daylighted shared through-right lane. During the non-game weekday AM peak hour and the Saturday post-game peak hour, signal timing modifications would also be ~~also~~ required to partially mitigate the significant impacts.

Northern Boulevard at Parsons Boulevard

Significant impacts are expected during all seven peak hours and would be partially mitigated in the non-game weekday PM and weekday pre-game PM peak hours, and fully mitigated during the remaining five peak hours by installing “No Standing Anytime” regulations along the south side of eastbound Northern Boulevard for 200 feet from the intersection, north side of westbound Northern Boulevard for 150 feet from the intersection, and west side of southbound Parsons Boulevard for 150 feet from the intersection to allow for a 10-foot-wide daylighted right-turn lane on each approach, and signal timing adjustments during the non-game weekday AM, midday, and PM, and weekday pre-game peak hours.

34TH AVENUE

The intersection of 34th Avenue at 126th Street (and the Grand Central Parkway and eastbound Northern Boulevard ramps) would be significantly impacted during all seven peak hours since the intersection would be a key gateway to the District. The other intersection, 34th Avenue at 114th Street, would be significantly impacted during all seven peak hours except the non-game weekday AM peak hour.

34th Avenue at 114th Street

Significant impacts are expected during all seven peak hours except the non-game weekday AM peak hour, which could be fully mitigated by modifying the signal timing plan.

34th Avenue at 126th Street

Significant impacts are expected during all seven analysis peak hours. As a key entrance point to the District, this intersection would carry significant volumes of project generated traffic. Its geometric complexity, with approaches from two exit ramps in addition to the 126th Street northbound and 34th Avenue eastbound and westbound approaches, limits traditional capacity improvement options. Therefore, this intersection would require the same standard and cost intensive mitigation measures as those discussed for this intersection in Phase 1A. ~~including reconstructing and merging the Grand Central Parkway and Northern Boulevard ramp approaches to have two 10 foot wide travel lanes and one 11 foot wide exclusive right turn lane, widening the roadway on the east leg of the intersection to 40 feet to provide two 10 foot wide westbound approach lanes and two 10 foot~~

~~wide eastbound receiving lanes, restriping the northbound 126th Street approach from two 11-foot-wide travel lanes, one 12-foot-wide travel lane, and one 7-foot-wide hatched median to three 12-foot-wide travel lanes and one 5-foot-wide Class II bicycle lane, and modifying the signal timing and phasing plan.~~ These measures would fully mitigate significant impacts during the non-game weekday AM, ~~midday, and Saturday midday~~ peak hour and all game day peak hours, and would partially mitigate the significant impacts in the remaining peak hours, i.e., the non-game ~~midday and PM~~ peak hours and ~~the Saturday midday~~ all game day peak hours.

ROOSEVELT AVENUE

All nine intersections would be significantly impacted during the seven analysis peak hours, except for the intersection of Roosevelt Avenue at 111th Street during the non-game weekday AM ~~and midday~~ peak hours, the intersection at Prince Street during the non-game weekday midday, ~~PM,~~ and Saturday midday peak hours and all game day peak hours, and the intersection at Parsons Boulevard during the non-game weekday midday and PM peak hours, and the Saturday pre-game and post-game peak hours. In each time period, the intersection of Roosevelt Avenue at Union Street would be unmitigatable. Limited mitigation options for the Roosevelt Avenue corridor would be possible, due in part to limited space for travel lanes and critical curbside activities, including bus stops, bus layover, and truck loading/unloading, and columns supporting the No. 7 subway line.

Roosevelt Avenue at 108th Street

Significant impacts would occur in all seven peak hours and could be fully mitigated by using the same measures described for Phase 1A.

Roosevelt Avenue at 111th Street

Significant impacts would occur in all peak hours except during the non-game weekday AM peak hour and could be partially mitigated in the Saturday midday peak hour, and fully mitigated in the remaining peak hours by providing the same measures described for Phase 1A.

Roosevelt Avenue at 114th Street

Significant impacts would occur in all seven peak hours. Measures necessary for full mitigation of significant impacts during six of the seven peak hours and partial mitigation during the Saturday post-game peak hour include geometric changes, signal phasing and timing plan changes, limited prohibition of parking, and pavement restriping. The centerline on the westbound approach would be shifted 11 feet to the south and the approach would be restriped from two 11-foot-wide travel lanes to one 11-foot-wide exclusive left-turn lane, one 11-foot-wide through lane, and one 11-foot-wide exclusive right-turn lane (upstream of the intersection, Roosevelt Avenue would continue to operate as two lanes in each direction). The eastbound approach of Roosevelt Avenue would be restriped from two 11-foot-wide travel lanes to one 11-foot-wide exclusive left-turn lane and one 11-foot-wide shared through-right travel lane. The centerline of the northbound 114th Street approach would be shifted 3 feet to the east and the approach would be restriped from one 16-foot-wide travel lane to one 13-foot-wide travel lane. The centerline of the southbound 114th Street approach would be shifted two feet to the east. Parking prohibitions at this location include installing “No Standing Anytime” regulations along the south curb of the eastbound Roosevelt Avenue approach 250 feet from the intersection, installing “No Standing Anytime” regulations along the east curb of the northbound 114th Street approach 250 feet from the intersection, and installing “No Standing 3 PM–7 PM” regulations along the west curb of the southbound 114th Street approach 150 feet from the intersection to allow for one 12-foot-wide left-through lane and one 10-foot-wide right-turn lane. Signal phasing and timing plan would be modified.

Roosevelt Avenue at 126th Street

Significant impacts would occur in all seven peak hours. These impacts would be unmitigated during the non-game weekday AM peak hour and could be ~~fully mitigated during the non-game AM peak hour~~ and partially mitigated in the remaining peak hours by restriping the northbound approach from one wide 25-foot-wide lane to two 12-foot-wide lanes with a 1-foot buffer at the east curb and modifying the signal phasing and timing plan. In addition to these measures, additional mitigation measures would be required during all game-day peak hours including placing cones on the southbound approach to allow for one 12-foot-wide right-turn lane and one 12-foot-wide shared left-through lane during the weekday and Saturday pre-game peak hours, and on the eastbound approach to allow for one left-turn lane and one shared through-right lane during the Saturday post-game peak hour, and having a TEA operate the signal using the suggested signal timing plan.

Roosevelt Avenue at College Point Boulevard

Significant impacts would occur in all seven peak hours. These impacts could be fully mitigated during the non-game weekday AM peak hour and partially mitigated in the remaining six peak hours by using the same measures described for Phase 1A.

Roosevelt Avenue at Prince Street

Significant impacts would occur during the non-game weekday AM and PM peak hours and could be fully mitigated by using the same measures described for Phase 1A, ~~and by installing “No Standing 7 AM–4 PM Monday–Friday” regulations on the north curb of the westbound approach 175 feet from the stop bar to allow for an 11-foot-wide daylighted right-turn pocket, and modifying the signal phasing and timing plan.~~

Roosevelt Avenue at Main Street

This intersection would be significantly impacted during all seven peak hours and could be fully mitigated in the non-game weekday AM and midday peak hours and the Saturday pre-game peak hours, and partially mitigated in the remaining peak hours ~~(except during non-game weekday PM peak hour when it would be unmitigatable)~~ by modifying the signal timing plan.

Roosevelt Avenue at Union Street

None of the significant impacts expected during all seven peak hours could be mitigated.

Roosevelt Avenue at Parsons Boulevard

Significant impacts are expected during the non-game weekday AM and ~~the~~ Saturday midday peak hours, and during the weekday pre-game peak hour. These impacts could be fully mitigated by prohibiting parking between 7 AM–10 AM and 4 PM–7 PM (Monday through Friday) on the northbound approach 75 feet from the intersection to allow for a 10-foot-wide daylighted right-turn lane, and modifying the signal timing in the non-game weekday AM and weekday pre-game peak hours. Significant impacts during the Saturday midday peak hour could be partially mitigated by installing “No Standing 10 AM–8 PM, Saturday” regulations on the northbound approach 75 feet from the intersection to allow for a 10-foot-wide daylighted right-turn lane and modifying the signal timing.

Willeys Point Development

SANFORD AVENUE

One of the three intersections analyzed along Sanford Avenue, i.e., Parsons Boulevard at Sanford Avenue, would be significantly impacted during the non-game weekday AM, midday, and Saturday midday peak hours and weekday pre-game peak hour.

Sanford Avenue at College Point Boulevard

Significant impacts are not expected during any of the analysis peak hours.

Sanford Avenue at Union Street

Significant impacts are not expected during any of the analysis peak hours.

Sanford Avenue at Parsons Boulevard

Modifying signal timings, shifting the northbound centerline one foot to the west to allow for a 20-foot-wide northbound approach, and installing “No Standing 7 AM–7 PM Monday–Friday” regulations on the northbound approach 75 feet from the stop bar to allow for one 10-foot-wide left-through lane and one 10-foot-wide daylighted right-turn pocket would fully mitigate the significant impacts expected during the non-game weekday AM, and midday, ~~PM~~ peak hours and the weekday pre-game peak hours. The intersection would be unmitigated during the Saturday non-game peak hour.

OTHER STUDY AREA LOCATIONS

Kissena Boulevard at Main Street

Modifying signal timings would fully mitigate significant impacts during the Saturday midday peak hour.

32nd Avenue at College Point Boulevard

Significant impacts are not expected during any of the analysis peak hours.

World's Fair Marina at Boat Basin Road

Significant impacts would occur in all seven peak hours. Significant impacts at this currently unsignalized intersection could be fully mitigated by using the same measures described for Phase 1A.

Northern Boulevard Service Road at College Point Boulevard

Modifying signal timings would fully mitigate significant impacts during all peak hours except the non-game weekday PM, ~~and~~ weekday pre-game, and Saturday pre-game and post-game peak hours when mitigation is not required.

Boat Basin Road at Stadium Road

Significant impacts are expected in all ~~seven~~ peak hours except the non-game weekday AM peak hour and could be fully mitigated during the ~~non-game weekday AM and the~~ Saturday post-game peak hours, and partially mitigated during the weekday pre-game peak hour by installing an actuated signal controller and by modifying the signal phasing and timing plan. None of the significant impacts expected during the non-game weekday midday, PM and Saturday midday and Saturday pre-game peak hours could be mitigated.

Stadium Road at the Grand Central Parkway Ramp

Significant adverse impacts are expected during all peak hours except the non-game weekday AM peak hour, and could be fully mitigated by the same measures described for Phase 1A. The

new westbound approach exiting the Willets West Center would continue to operate at unacceptable LOS D or LOS E during all peak hours except the non-game weekday AM peak hour.

Willets Point Boulevard at Northern Boulevard

Significant impacts are expected during ~~all the~~ Saturday post-game peak hours, and could be fully mitigated by installing a traffic signal with a 90 second cycle length.

126th Street at New Willets Point Boulevard

Significant impacts are not expected during any of the analysis peak hours.

~~In addition to the study locations analyzed and reported above, the intersections of 126th Street at 36th Avenue, 126th Street at 37th Avenue, and Northern Boulevard at 126th Place are expected to carry a significant amount of project-generated trips in Phase 1B. These three intersections were not analyzed for this Draft SEIS since the majority of project-generated trips from the District were assigned to the adjacent analyzed intersections. Since impacts have been identified for these adjacent intersections, the three intersections listed above will be analyzed for the Final SEIS to determine if they would similarly experience significant adverse impacts. If they are found to be significantly impacted under the With Action condition, mitigation measures such as those typically implemented by NYCDOT would be further explored to address the impacts, or if no practicable mitigation measures can be identified, the impacts would be disclosed as being unmitigatable.~~

126th Street at 36th Avenue

Significant impacts are expected during the Saturday pre-game and post-game peak hours and would be fully mitigated during the Saturday pre-game peak hour by restriping the westbound approach as one 10-foot-wide left-turn lane and one 10-foot-wide right-turn lane. Significant impacts expected during the Saturday post-game peak hour would be partially mitigated.

126th Street at 37th Avenue

Significant impacts are expected during the non-game weekday midday and Saturday post-game peak hours and would be fully mitigated during the non-game weekday midday peak hour and partially mitigated during the Saturday post-game peak hour by restriping the westbound approach as one 10-foot-wide left-turn lane and one 10-foot-wide right-turn lane.

TRAFFIC—PHASE 2 (2032)

Table 21-5 presents a summary of significant adverse traffic impacts and their ability to be mitigated, and **Table 21-6** summarizes the unmitigated traffic study area locations by time period. Details of the intersection capacity results and traffic mitigation measures are provided in tables at the back of this chapter.

Table 21-5
Traffic Impact Mitigation Summary—Phase 2 (2032)

Intersection	Without a Mets Game				With a Mets Game		
	Weekday AM	Weekday Midday	Weekday PM	Saturday Midday	Weekday Pre-Game PM	Saturday Pre-Game Midday	Saturday Post-Game PM
No Significant Impact	9 11	5 6	5	5 7	6	8 9	8 9
Fully Mitigated Impact	44 13	44 12	43 14	11	44 13	11	44 9
Partially Mitigated Impact	3 5	7 8	7 9	8 9	9	8 7	7 9
Unmitigated Impact	5	5 8	6	7	5 6	4 7	5 7

Table 21-6
Summary of Unmitigated Intersections—Phase 2 (2032)

Intersection	Without a Mets Game				With a Mets Game

126th Street at 37th Avenue		X				X	X
Northern Boulevard at 126th Place							

Notes: "X" means the intersection would be unmitigated in the corresponding peak hour

The overall finding of the traffic mitigation analysis is that the majority of locations analyzed under the proposed project would be significantly impacted, and that the need for a broad range of mitigation measures would be substantial. As noted for Phases 1A and 1B, approximately one-half or more, depending on the peak hour, of the significantly impacted locations could be fully or partially mitigated with the same types of measures described for Phases 1A and 1B. The locations that were fully or partially mitigated during any of the seven peak analysis hours are listed below:

- 108th Street at Astoria Boulevard
- 108th Street at Northern Boulevard
- 114th Street at Northern Boulevard
- 126th Street at Northern Boulevard
- Prince Street at Northern Boulevard
- Union Street at Northern Boulevard
- Parsons Boulevard at Northern Boulevard
- 114th Street at 34th Avenue
- 126th Street/GCP Ramp at 34th Avenue
- 108th Street at Roosevelt Avenue
- 111th Street at Roosevelt Avenue

- 114th Street at Roosevelt Avenue
- 126th Street at Roosevelt Avenue
- College Point Boulevard at Roosevelt Avenue
- Prince Street at Roosevelt Avenue
- Main Street at Roosevelt Avenue
- Parsons Boulevard at Roosevelt Avenue
- Main Street at Kissena Boulevard
- College Point Boulevard at Sanford Avenue
- Parsons Boulevard at Sanford Avenue
- College Point Boulevard at Northern Boulevard Service Road
- Boat Basin Road at Stadium Road
- Boat Basin Road at World's Fair Marina
- Willets Point Boulevard at Northern Boulevard
- GCP Ramp at West Park Loop/Stadium Road
- 126th Street at 36th Avenue
- 126th Street at 37th Avenue

The following intersections could only be partially mitigated or could not be mitigated at all during the following time periods:

- In the weekday non-game AM peak hour, there would be five unmitigatable intersections including Prince Street at Northern Boulevard, Main Street at Northern Boulevard, Union Street at Northern Boulevard, Union Street at Roosevelt Avenue, and College Point Boulevard at the westbound Northern Boulevard service road and ~~three~~ five intersections including 108th Street at Northern Boulevard, 126th Street at Northern Boulevard, Parsons Boulevard at Northern Boulevard, 126th Street/GCP Ramp at 34th Avenue, and 126th Street at Roosevelt Avenue would be partially mitigated.
- In the non-game weekday midday peak hour, there would be ~~five~~ eight unmitigatable intersections including Main Street at Northern Boulevard, Main Street at Roosevelt Avenue, Union Street at Roosevelt Avenue, College Point Boulevard at the westbound Northern Boulevard service road, ~~and~~ Boat Basin Road at Stadium Road, 126th Street at 36th Avenue, and 126th Street at 37th Avenue, and ~~seven~~ eight intersections including the Northern Boulevard intersections at 126th Street, Prince Street, Union Street and at Parsons Boulevard, 126th Street/GCP ramp at 34th Avenue, 126th Street at Roosevelt Avenue, College Point Boulevard at Roosevelt Avenue, and 108th Street at Roosevelt Avenue would be partially mitigated.
- In the non-game weekday PM peak hour, there would be six unmitigatable intersections including 108th Street at Astoria Boulevard, Main Street at Northern Boulevard, 111th Street at Roosevelt Avenue, ~~Main Street at Roosevelt Avenue~~, Union Street at Roosevelt Avenue, ~~and~~ Boat Basin Road at Stadium Road, and 126th Street at 36th Avenue, and ~~seven~~ nine intersections including the Northern Boulevard intersections at 126th Street, Prince Street, Union Street, and Parsons Boulevard, 126th Street/GCP ramp at 34th Avenue, and the intersections of Roosevelt Avenue at 108th Street, 126th Street, ~~and~~ College Point Boulevard, and Main Street would be partially mitigated.
- In the non-game Saturday midday peak hour, there would be seven unmitigatable intersections including 108th Street at Astoria Boulevard, Main Street at Northern Boulevard, the intersections of Roosevelt Avenue at 111th Street, Union Street, and Parsons Boulevard, College Point Boulevard at the westbound Northern Boulevard service road, and Boat Basin Road at Stadium Road, and ~~eight~~ nine intersections including the Northern Boulevard intersections at 108th Street, 126th Street, Prince Street, and Union Street, 126th

Willetts Point Development

Street/GCP ramp at 34th Avenue, and the intersections of Roosevelt Avenue at 108th Street, 126th Street, College Point Boulevard, and Main Street would be partially mitigated.

- In the weekday pre-game peak hour, there would be ~~five~~ six unmitigatable intersections including 108th Street at Astoria Boulevard, 126th Street at Northern Boulevard, Main Street at Northern Boulevard, 111th Street at Roosevelt Avenue, Union Street at Roosevelt Avenue, and Parsons Boulevard at Roosevelt Avenue, and nine intersections including the Northern Boulevard intersections at Prince Street, Union Street, and Parsons Boulevards, 126th Street/GCP ramp at 34th Avenue, the intersections of Roosevelt Avenue at 114th Street, 126th Street, College Point Boulevard, and Main Street, and Boat Basin Road at Stadium Road would be partially mitigated.
- In the Saturday pre-game peak hour, there would be ~~four~~ seven unmitigatable intersections including 126th Street at Northern Boulevard, Main Street at Northern Boulevard, 111th Street at Roosevelt Avenue, Union Street at Roosevelt Avenue, ~~and~~ College Point Boulevard at the westbound Northern Boulevard service road, 126th Street at 36th Avenue, and 126th Street at 37th Avenue, and ~~eight~~ seven intersections including Northern Boulevard intersections at Prince Street, and Union Street, 126th Street/GCP ramp at 34th Avenue, the intersections of Roosevelt Avenue at 108th Street, 126th Street, and College Point Boulevard, ~~and Main Street~~, and Boat Basin Road at Stadium Road would be partially mitigated.
- In the Saturday post-game peak hour, there would be ~~five~~ seven unmitigatable intersections including Main Street at Northern Boulevard, Prince Street at Northern Boulevard, 111th Street at Roosevelt Avenue, Union Street at Roosevelt Avenue, ~~and~~ Boat Basin Road at Stadium Road, 126th Street at 36th Avenue, and 126th Street at 37th Avenue, and ~~seven~~ nine intersections including Northern Boulevard intersections at 114th Street, 126th Street, and Union Street, 126th Street/GCP ramp at 34th Avenue, the intersections of Roosevelt Avenue at 108th Street, 114th Street, 126th Street, College Point Boulevard, and Main Street would be partially mitigated.
- A summary of the traffic mitigation findings for each analysis location, including the proposed mitigation measures where applicable, is provided below.

ASTORIA BOULEVARD

The analyzed intersection at 108th Street would be significantly impacted during all seven peak hours ~~except the non-game weekday AM peak hour~~. The impacts on the northbound de-facto left turn lane on 108th Street, and on the eastbound Astoria Boulevard approach could not be mitigated during the non-game weekday PM, Saturday midday and weekday pre-game peak hours. Signal timing modifications at this intersection during the above mentioned peak hours would not be possible without creating new significant impacts, and geometric modifications to improve capacity would not be feasible. The expected significant impacts could be fully mitigated during the non-game weekday midday, Saturday pre-game and Saturday post-game by installing “No Standing 11 AM–2 PM Monday–Friday” and “No Standing 3 PM–10 PM Saturday” regulations along the south curb of the eastbound approach for 150 feet from the intersection to allow for an 11-foot-wide daylighted right-turn lane, and by modifying the signal timing plan during the weekend game-day peak hours.

NORTHERN BOULEVARD

All ~~seven~~ eight intersections analyzed along Northern Boulevard would be significantly impacted during all seven peak hours, except the intersection of Northern Boulevard at 126th

Place which would only be impacted during the non-game weekday PM and weekday pre-game peak hours.

Northern Boulevard at 108th Street

This intersection would be significantly impacted during all non-game and game day peak hours and would be partially mitigated in the non-game weekday AM peak hour and the Saturday midday peak hour, and fully mitigated during the remaining peak hours by installing “No Standing Anytime” regulations along the east curb and west curb of the northbound and southbound approaches, respectively for 250 feet from the intersection to allow for two moving lanes, restriping the northbound approach of 108th Street from one 22-foot-wide lane to one 11-foot-wide exclusive left-turn lane and one 11-foot-wide shared through-right lane for 175 feet, restriping the southbound approach of 108th Street from one 23-foot-wide lane to one 11-foot-wide exclusive left-turn lane and one 12-foot-wide shared through-right lane for 175 feet. In addition to these measures, other measures would be required including modifying the signal timing plan in all peak hours except during the non-game weekday PM and weekday pre-game peak hours, and prohibiting parking between 10 AM–9 PM along the north and south curbs of the westbound and eastbound approaches, respectively for 150 feet from the intersection to allow for a 10-foot-wide daylighted right-turn lane in all peak hours except during the non-game weekday AM peak hour.

Northern Boulevard at 114th Street

This intersection would be significantly impacted during all seven peak hours and could not be fully mitigated by applying traditional mitigation measures. Therefore, additional mitigation measures would be required, which would partially mitigate the significant impacts during the Saturday post-game peak hour and fully mitigate significant impacts in the remaining peak hours by prohibiting left turns from westbound Northern Boulevard and diverting them to southbound 114th Street to allow for three exclusive through lanes along westbound Northern Boulevard. Additional mitigation would include prohibiting parking along the ~~west~~ east side of southbound 114th Street and restriping the approach for two 11-foot-wide moving lanes, restriping the southbound 114th Street receiving lanes as two 11-foot-wide moving lanes with parking on both sides, and modifying the signal phasing and timing plan.

Northern Boulevard at 126th Street

This intersection would be significantly impacted during all seven peak hours. Significant adverse impacts are expected on the northbound 126th Street approach, on eastbound Northern Boulevard, on the eastbound Grand Central Parkway ramp, and on westbound Northern Boulevard (leading to the intersection from the Van Wyck and Whitestone Expressway off-ramps). None of the significant impacts expected during the seven peak hours could be mitigated by applying traditional mitigation measures. As noted previously for Phases 1A and 1B, this intersection is the convergence point of Northern Boulevard, 126th Street, and two highway exit ramps carrying significant project-generated traffic volumes, and consistently long queues are experienced on the westbound approach, especially the lane adjacent to the north curb. Therefore, to ~~fully~~ partially mitigate the significant impacts during ~~all~~ five of the seven peak hours, this intersection would require the same cost intensive mitigation measures identified for Phases 1A and 1B. Significant impacts during the weekday and Saturday pre-game peak hours would be unmitigated.

Willets Point Development

Northern Boulevard at 126th Place

Significant impacts are expected during the non-game weekday PM and weekday pre-game peak hours. These impacts could be fully mitigated by installing a traffic signal with a 120 second cycle.

Northern Boulevard at Prince Street

This intersection would have significant adverse impacts during all seven peak hours, which would be unmitigatable in the non-game weekday AM peak hour and the Saturday post-game peak hour, and partially mitigated in the remaining peak hours by using the same measures described for Phase 1B.

Northern Boulevard at Main Street

None of the significant impacts expected during all seven peak hours could be mitigated.

Northern Boulevard at Union Street

This intersection would be significantly impacted during all seven peak hours with significant impacts expected on both Northern Boulevard approaches, which would be unmitigatable in the non-game weekday AM peak hour, and could be partially mitigated in the remaining six peak hours by installing “No Standing 7 AM–10 PM” regulations along the north curb of the westbound Northern Boulevard approach 200 feet from the intersection to allow for one 10-foot-wide daylighted shared through-right lane. During the Saturday post-game peak hour, signal timing modifications would also be required to partially mitigate the significant impacts.

Northern Boulevard at Parsons Boulevard

Significant adverse impacts are expected during all seven peak hours and would be partially mitigated in the non-game weekday AM, midday, PM and weekday pre-game peak hours, and fully mitigated during the remaining three peak hours by installing “No Standing Anytime” regulations along the south side of eastbound Northern Boulevard for 200 feet from the intersection, north side of westbound Northern Boulevard for 150 feet from the intersection, and west side of southbound Parsons Boulevard for 150 feet from the intersection to allow for a 10-foot-wide daylighted right-turn lane on each approach, and signal timing adjustments during all seven peak hours except the non-game weekday midday peak hour. These are the same measures described for Phase 1B.

34TH AVENUE

The intersection of 34th Avenue at 126th Street (and the Grand Central Parkway and eastbound Northern Boulevard ramps) would be significantly impacted during all seven peak hours since the intersection would be a key gateway to the District. The other intersection, 34th Avenue at 114th Street, would be significantly impacted during all seven peak hours except the non-game weekday AM peak hour.

34th Avenue at 114th Street

Significant impacts are expected during all seven peak hours except the non-game weekday AM peak hour and could be fully mitigated by modifying the signal timing plan.

34th Avenue at 126th Street

Significant impacts are expected during all seven analysis peak hours. As noted previously, this is a key entrance point to the District; this intersection would carry significant volumes of

project generated traffic. Its geometric complexity, with approaches from two exit ramps in addition to the 126th Street northbound and 34th Avenue eastbound and westbound approaches, limits traditional capacity improvement options, and would require the same cost intensive mitigation measures described for Phases 1A and 1B. The above mentioned mitigation measures would ~~fully mitigate significant impacts during the non-game weekday AM peak hour, and would~~ partially mitigate significant impacts in ~~the remaining~~ all seven peak hours.

ROOSEVELT AVENUE

All nine intersections would be significantly impacted during all seven peak hours, except for the intersection at Prince Street during the non-game ~~weekday~~ Saturday midday and Saturday pre-game and post-game peak hours, ~~the intersection at Main Street during the non-game weekday PM peak hour, and~~ the intersection at Parsons Boulevard during the Saturday midday, weekday pre-game, and the Saturday pre-game peak hours. In each time period, the intersection of Roosevelt Avenue at Union Street would be unmitigatable. Limited mitigation options for the Roosevelt Avenue corridor would be possible, due in part to limited space for travel lanes and critical curbside activities, including bus stops, bus layover, and truck loading/unloading, and columns supporting the No. 7 subway line.

Roosevelt Avenue at 108th Street

Significant impacts would occur in all seven peak hours and could be fully mitigated in the non-game weekday AM and weekday pre-game peak hours, and partially mitigated in the remaining peak hours by installing “No Standing Anytime” regulations along the east curb of the northbound 108th Street approach 150 feet from the intersection to allow for one 11-foot-wide left-through lane and one 11-foot-wide right-turn lane, and installing “No Standing Anytime” regulations along the west curb of the southbound 108th Street approach 150 feet from the intersection to allow for one 11-foot-wide left-through lane and one 11-foot-wide right-turn lane.

Roosevelt Avenue at 111th Street

Significant impacts would occur in all seven peak hours and could be fully mitigated in the non-game weekday AM and midday peak hours by installing “No Standing 7 AM–4 PM Monday–Friday” regulations along the north curb of the westbound Roosevelt Avenue approach 100 feet from the intersection to allow for one 11-foot-wide left-through lane and one 10-foot-wide daylighted right-turn lane. None of the significant impacts in the remaining peak hours could be mitigated.

Roosevelt Avenue at 114th Street

Significant impacts would occur in all seven peak hours. These impacts could be partially mitigated in the weekday pre-game and Saturday post-game peak hours, and fully mitigated in the remaining ~~six~~ five peak hours by using the same measures described for Phase 1B and replacing the “No Standing 3 PM–7 PM” regulations proposed in Phase 1B along the west curb of the southbound 114th Street approach 150 feet from the intersection with “No Standing 4 PM–7PM Monday-Friday” and “No Standing 1PM–9PM Saturday” regulations along the west curb of the southbound 114th Street approach 150 feet from the intersection.

Roosevelt Avenue at 126th Street

Significant impacts would occur in all seven peak hours and would be partially mitigated by reconfiguring all approaches to the intersection. The northbound 126th Street approach would have one 10-foot-wide exclusive left-turn lane and two 10-foot-wide travel lanes. The centerline of the southbound 126th Street approach would be shifted nine feet to the east and the approach

Willeys Point Development

would be restriped from one 11-foot-wide and one 12-foot-wide travel lane to one 11-foot-wide exclusive left-turn lane, one 10-foot-wide through lane, and one 11-foot-wide exclusive right-turn lane for 250 feet. The centerline of the eastbound Roosevelt Avenue approach would be shifted one foot to the north and the approach would be restriped from one 10-foot-wide and 11-foot-wide travel lane to two 11-foot-wide travel lanes. The centerline of the westbound Roosevelt Avenue approach would be shifted one foot to the south and the approach would be restriped from one 11-foot-wide and 10-foot-wide travel lane to two 11-foot-wide travel lanes. In addition, the signal phasing and timing plan would be modified.

Roosevelt Avenue at College Point Boulevard

Significant impacts would occur in all seven peak hours. These impacts could be fully mitigated during the non-game weekday AM peak hour and partially mitigated in the remaining six peak hours by using the same measures described for Phase 1A.

Roosevelt Avenue at Prince Street

This intersection would be significantly impacted during all seven peak hours except during the non-game ~~weekday~~ Saturday midday, Saturday pre-game, and Saturday post-game peak hours and could be fully mitigated during the weekday non-game AM and PM and weekday pre-game PM peaks hours by ~~shifting the center line of the eastbound Roosevelt Avenue approach six feet to the north, restriping the eastbound Roosevelt Avenue approach from one 11 foot wide travel lane and one 19 foot wide travel lane with parking to one 11 foot wide exclusive left turn lane, one 11 foot wide travel lane, one six feet hatched buffer, and one 8 feet parking lane for 250 feet, restriping the westbound Roosevelt Avenue receiving side from one 9 foot wide travel lane and one 19 foot wide travel lane to two 11 foot wide travel lanes for 250 feet, installing “No Standing 7 AM–10 AM 4 PM Monday–Friday” regulations on the north curb of the westbound approach 175 feet from the stop bar to allow for an 11 foot wide daylighted right turn pocket during the non-game weekday AM and midday peak hours, and modifying the signal phasing and timing plan.~~ Significant impacts during the non-game weekday midday peak hour would be unmitigatable.

Roosevelt Avenue at Main Street

This intersection would be significantly impacted during all seven peak hours. Significant impacts could be fully mitigated in the non-game weekday AM and Saturday pre-game peak hours, and partially mitigated in the remaining peak hours (except during the non-game weekday midday ~~and PM~~ peak hours when it would be unmitigatable) by modifying the signal timing plan.

Roosevelt Avenue at Union Street

None of the significant impacts expected during all seven peak hours could be mitigated.

Roosevelt Avenue at Parsons Boulevard

Significant impacts are expected during the non-game weekday AM, midday, PM, and Saturday midday, and the weekday pre-game and weekend post-game peak hours. These impacts could be fully mitigated during the non-game weekday AM, midday, and PM, and the Saturday pre-game and Saturday post-game peak hours by modifying the signal timing plan, installing “No Standing 7 AM–10 AM and 4 PM–7 PM, Monday–Friday” and “No Standing 10 AM–9 PM Saturday” regulations on the northbound approach 75 feet from the intersection to allow for a 10-foot-wide daylighted right-turn lane. Significant impacts during the non-game Saturday midday and weekday pre-game peak hours would be unmitigatable.

SANFORD AVENUE

Parsons Boulevard at Sanford Avenue would be significantly impacted during all ~~seven~~ peak hours except during the Saturday pre-game peak hour, and College Point Boulevard at Sanford Avenue would be significantly impacted during the non-game weekday PM and the Saturday midday peak hours.

Sanford Avenue at College Point Boulevard

Upgrading to a computerized signal controller, modifying signal timings, and installing “No Standing 4 PM–7 PM, Monday-Friday” regulations on the southbound approach 75 feet from the intersection to allow for a 10-foot-wide daylighted right-turn lane would fully mitigate significant impacts during the non-game weekday PM and the Saturday midday peak hours.

Sanford Avenue at Union Street

Significant impacts are not expected during any of the analysis peak hours.

Sanford Avenue at Parsons Boulevard

Significant impacts are expected during all seven peak hours. Modifying signal timings, shifting the northbound centerline one foot to the west to allow for a 20-foot-wide northbound approach, installing “No Standing Anytime” regulations on the northbound approach 75 feet from the stop bar to allow for one 10-foot-wide left-through lane and one 10-foot-wide daylighted right-turn pocket, installing “No Standing 10 AM–9 PM” regulations on the southbound approach 75 feet from the stop bar to allow for a 10-foot-wide daylighted right-turn lane in all peak hours except the non-game weekday AM peak hour, and installing “No Standing 10 AM–4 PM” regulations on the westbound approach 100 feet from the stop bar to allow for a 10-foot-wide daylighted right-turn lane would fully mitigate the significant impacts expected during all seven peak hours.

OTHER STUDY AREA LOCATIONS

Kissena Boulevard at Main Street

Modifying signal timings would fully mitigate significant impacts during the non-game weekday midday, Saturday midday, and weekend pre-game peak hours.

32nd Avenue at College Point Boulevard

Significant impacts are not expected during any of the analysis peak hours.

World’s Fair Marina at Boat Basin Road

Significant impacts would occur in all seven peak hours. Significant impacts at this currently unsignalized intersection could be fully mitigated by using the same measures described for Phase 1A.

Northern Boulevard Service Road at College Point Boulevard

Modifying signal timings would fully mitigate the significant impacts expected during the non-game weekday PM and weekday pre-game peak hours. Significant impacts are not expected during the Saturday post-game peak hour. None of the significant impacts in the remaining peak hours could be mitigated.

Boat Basin Road at Stadium Road

Significant impacts are expected in all seven peak hours and could be fully mitigated during the non-game weekday AM peak hour, and partially mitigated during the weekday pre-game and Saturday pre-game peak hours by installing an actuated signal controller and by modifying the

Willets Point Development

signal phasing and timing plan. None of the significant impacts expected during the non-game weekday midday, PM and Saturday midday, and Saturday post-game peak hours could be mitigated.

Stadium Road at the Grand Central Parkway Ramp

Significant adverse impacts are expected during all peak hours except the non-game weekday AM peak hour, and could be fully mitigated by the same measures described for Phase 1A. The new westbound approach exiting the Willets West Center would continue to operate at unacceptable LOS D, LOS E, or LOS F during all peak hours except the non-game weekday AM peak hour.

Willets Point Boulevard at Northern Boulevard

Significant impacts are expected during all peak hours except the non-game weekday AM peak hour, and could be fully mitigated by installing a traffic signal with a 60 second cycle length, and channelizing the eastbound right-turn traffic and channelizing the eastbound through traffic and the northbound right-turn traffic on the receiving side to allow for concurrent traffic flow.

126th Street at New Willets Point Boulevard

Significant impacts are not expected during any of the analysis peak hours.

CitiField/Lot B at Roosevelt Avenue

Significant impacts are not expected during any of the analysis peak hours.

~~In addition to the study locations analyzed and reported above, the intersections of 126th Street at 36th Avenue, 126th Street at 37th Avenue, and Northern Boulevard at 126th Place are expected to carry a significant amount of project generated trips in Phase 2. These three intersections were not analyzed for this Draft SEIS since the majority of project generated trips from the District were assigned to the adjacent analyzed intersections. Since impacts have been identified for these adjacent intersections, the three intersections listed above will be analyzed for the Final SEIS to determine if they would similarly experience significant adverse impacts. If they are found to be significantly impacted under the With Action condition, mitigation measures such as those typically implemented by NYCDOT would be further explored to address the impacts, or if no practicable mitigation measures can be identified, the impacts would be disclosed as being unmitigatable.~~

126th Street at 36th Avenue

Significant impacts are expected during all seven peak hours and would be fully mitigated during the non-game weekday AM and Saturday midday peak hours and during the weekday pre-game peaks hour. Mitigation measures include restriping the westbound approach as one 10-foot-wide left-turn lane and one 10-foot-wide right-turn lane. Significant impacts during the remaining four peak hours would be unmitigatable.

126th Street at 37th Avenue

Significant impacts are expected during all seven peak hours except the non-game weekday AM and Saturday midday peak hours and would be fully mitigated during the non-game weekday PM and weekday pre-game peak hours. Mitigation measures include restriping the westbound approach as one 10-foot-wide left-turn lane and one 10-foot-wide right-turn lane. Significant impacts during the remaining three peak hours would be unmitigatable.

HIGHWAY MITIGATION

As discussed in Chapter 14, “Transportation,” the proposed project would result in significant adverse highway impacts at a number of ramps and mainlines within the study area. The detailed traffic simulation analyses show that some of these highway impacts are a result of the extension of congestion or spillback from the surrounding local network intersections which affect highway conditions. This chapter discusses mitigation measures that are aimed at improving the system-wide operation of the roadway network including its highways and local street intersections. In some instances, the proposed mitigation measures may slightly or moderately impact new locations while improving system-wide conditions. One reason for this is that some highway elements that experience lower traffic volumes due to upstream “metering” under future conditions with the proposed project may experience higher volumes with the mitigation measures in place. It is important to note that with the proposed highway and local street mitigation measures, the overall operation of the highway system would improve significantly compared to the With Action condition. Highway mitigation measures and nearby local street intersection mitigation measures that would also improve highway conditions are described below. The need for these measures has also been discussed earlier in this chapter for specific intersections under “Traffic-Phase 1A (2018),” “Traffic-Phase 1B (2028),” and “Traffic-Phase 2 (2032).” Each of these measures is assumed to be in place for all three phases of development. ~~If the mitigation measures outlined below are not implemented, it is expected that significant adverse impacts previously identified in Chapter 14, “Transportation,” would remain unmitigated or partially mitigated, including but not necessarily limited to the westbound Grand Central Parkway (the east side, between Roosevelt Avenue and the LIE), the southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place, the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard, the ramp from the westbound Grand Central Parkway toward Stadium Road and the northbound Whitestone Expressway, and the ramp from eastbound Astoria Boulevard and the Grand Central Parkway to the northbound Whitestone Expressway and eastbound Northern Boulevard.~~

- Grand Central Parkway (GCP) Exit Ramp at West Park Loop/Stadium Road: Widen the Grand Central Parkway off-ramp to West Park Loop/Stadium Road from a single lane to two exit lanes. At the exit ramp’s intersection with West Park Loop/Stadium Road, provide three lanes—one left-turn lane, one through lane, and one channelized right-turn lane. Also, reconfigure the southbound Stadium Road approach to provide a southbound left-turn lane in the roadway median, and install a traffic signal at this currently unsignalized intersection. These measures would help prevent spillback of traffic onto the westbound GCP mainline.
- 126th Street/GCP Exit Ramp/34th Avenue: ~~Close the existing ramp from Grand Central Parkway /Astoria Boulevard to 126th Street and combine it with the existing ramp from eastbound Northern Boulevard to 126th Street, and stripe the proposed combined ramp as one shared left through lane, one exclusive through lane, and one exclusive right turn lane. Install a new traffic signal at the new intersection of the eastbound Northern Boulevard ramp to 126th Street at its intersection with the GCP/Astoria Boulevard. This new traffic signal would be coordinated with the upstream signals at Northern Boulevard at 126th Street and 34th Avenue at Shea Road. The GCP/Astoria Boulevard ramp would be striped as two through lanes to eastbound Northern Boulevard and one exclusive right turn lane to the Willets Point District. Close the existing slip ramp from eastbound Northern Boulevard to 126th Street and divert traffic to 126th Place, stripe the proposed widened GCP/Astoria Boulevard ramp as one 11-foot-wide left-turn lane and two 11-foot-wide through lanes. Construct a channelized right-turn from the GCP/Astoria Boulevard ramp to westbound~~

Shea Road, widen the westbound 34th Avenue approach to two 11-foot-wide travel lanes and two 11-foot-wide receiving lanes, restripe the northbound 126th Street approach from two 11-foot-wide travel lanes, one 12-foot-wide travel lanes and one 7-foot-wide hatched median to one 12-foot-wide exclusive left-turn lane, two 12-foot-wide travel lanes, and one 5-foot-wide Class II bicycle lane, and modify the existing signal timing plan. These measures would improve the efficiency of the signal operation and capacity of the intersection, and would reduce queuing and spillback onto upstream intersections and significantly improve the levels of services at the ramp from eastbound Astoria Boulevard and the GCP to the northbound Whitestone Expressway/eastbound Northern Boulevard.

- Northern Boulevard at 126th Street: Install ~~quick-curb channelization (i.e., plastic reflective pylons used for channelizing traffic)~~ Jersey barriers on the westbound Northern Boulevard approach to this intersection, between the right-most lane and the center lane to allow westbound Northern Boulevard traffic (originating from the Van Wyck and Whitestone Expressways) to have uninterrupted flow through the intersection; also, installing louvers (used on traffic signals to avoid confusion on two closely spaced intersection approaches where approaching motorists may be able to see the signal indication for another approach) would be beneficial along the westbound approach. Widen the eastbound Northern Boulevard approach from two 12-foot-wide lanes to three 10-foot-wide lanes and prohibit pedestrian crossing in the east crosswalk. At this intersection, uninterrupted flow of traffic from the Van Wyck and Whitestone Expressway ramps would significantly reduce the queuing of traffic back onto the two highway ramps and potentially the highway mainlines, which currently occurs at times during pre-game peak hours. In addition, modification of the existing signal timing and coordination with the northbound 126th Street approach would be required.
- World's Fair Marina at Boat Basin Road: Install a new traffic signal and implement a new signal timing plan; and restripe the northbound Boat Basin Road and westbound World's Fair Marina approaches. These measures would reduce queuing and spillback onto westbound Northern Boulevard.
- Boat Basin Road at Stadium Road: Install an actuated signal controller and modify the signal phasing and timing plan. These measures would reduce queuing and spillback onto westbound Northern Boulevard.
- Northern Boulevard at 114th Street: Prohibit left turns from westbound Northern Boulevard onto southbound 114th Street to allow for three exclusive through lanes along westbound Northern Boulevard. Westbound left turns would travel through the intersection and make right turns onto northbound 112th Place and then make another right turn onto southbound 114th Street. Prohibit parking along the east side of ~~Restripe the southbound 114th Street approach and re-stripe the approach~~ to provide shared left-through and shared through-right lanes. Modify the existing signal timing plan. These measures would help prevent spillback of westbound Northern Boulevard traffic onto the westbound Grand Central Parkway mainline.

The mitigation measures identified above for the intersections of World's Fair Marina at Boat Basin Road, Boat Basin Road at Stadium Road, and Northern Boulevard at 114th Street have been reviewed and approved by NYCDOT. NYCDOT reviewed and concurs with the operational analysis that was undertaken for the ~~The improvements identified above for the intersections at the~~ Grand Central Parkway westbound exit ramp at West Park Loop/Stadium Road, the intersection of 126th Street/GCP Exit Ramp/34th Avenue, and the intersection of

~~Northern Boulevard and 126th Street; NYCDOT has given approval for those measures within its jurisdiction (i.e., installation of a traffic signal at the intersection of West Park Loop/Stadium Road). are measures that may call for detailed review by both NYCDOT and NYSDOT and which Final design for construction of those measures which do not fall under the jurisdiction of NYCDOT will be further reviewed by NYSDOT closer to the time of construction. These measures represent preferred improvements that would benefit the overall traffic network. As discussed above, if these mitigation measures are modified or rejected by NYSDOT—the review agencies, significant adverse impacts identified above would may be unmitigated. Additional evaluations may be needed for the Final SEIS and could identify alternative measures that are deemed preferable to those identified above, in which case additional detailed simulation analyses may determine that projected conditions are better than those depicted in the Draft SEIS, or which could identify some deterioration in conditions and potential for previously identified significant adverse impacts that would be unmitigated or partially mitigated.~~

HIGHWAY MITIGATION—PHASE 1A (2018)

Non-Game Day

Resulting highway traffic densities, speeds, and levels of service are detailed in tables at the back of this chapter. In Phase 1A, implementing the mitigation measures at the key locations mentioned above would mitigate all significant impacts during all time periods except the weekday PM and Saturday midday peak hours.

During the non-game weekday AM peak hour, three locations that would be significantly impacted by the proposed project would be fully mitigated.

During the non-game weekday midday peak hour, two ~~four~~ locations that would be significantly impacted would be fully mitigated.

During the non-game weekday PM peak hour, four locations that would be significantly impacted would be fully mitigated and one location would remain unmitigatable—the southbound Van Wyck Expressway mainline (between Roosevelt Avenue and the LIE).

During the Saturday midday peak hour, of the five ~~six~~ locations that would be significantly impacted, two ~~three~~ locations would be fully mitigated and three locations would remain unmitigatable ~~(although vastly improved from With Action conditions)~~ including the westbound Grand Central Parkway mainline (the east side, between Roosevelt Avenue and the LIE), the westbound Grand Central Parkway mainline (the west side, between Roosevelt Avenue and the LIE), and the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard (which would be vastly improved from With Action conditions).

Game Day

Resulting highway traffic densities, speeds, and levels of service are detailed in tables at the back of this chapter. In Phase 1A, implementing the mitigation measures at the key locations mentioned above would mitigate all significant impacts during all time periods except for the ~~following~~ peak hours and locations discussed below.

During the weekday pre-game peak hour, ~~of the five locations that would be significantly impacted, one~~ four locations that would be significantly impacted by the proposed project would be fully mitigated. ~~would be fully mitigated and one location would remain unmitigatable—the southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place.~~

During the weekend pre-game peak hour, of the two ~~five~~ locations that would be significantly impacted, one ~~three~~ locations would be fully mitigated and the other two locations would remain unmitigatable (~~one of which would be~~ although ~~vastly improved from With Action conditions~~) including the southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place, and the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard. However, due to the proposed measures, one new location would be slightly impacted—the eastbound Grand Central Parkway mainline between Roosevelt Avenue and the LIE.

During the weekend post-game peak hour, of the three locations that would be significantly impacted, one location would be fully mitigated and two locations would remain unmitigatable including the ramp from the northbound Whitestone Expressway to the southbound Van Wyck Expressway, and the ramp from eastbound Astoria Boulevard/Grand Central Parkway to the northbound Whitestone Expressway/eastbound Northern Boulevard (which would be vastly improved from With Action conditions).

HIGHWAY MITIGATION—PHASE 1B (2028)

Non-Game Day

Resulting highway traffic densities, speeds, and levels of service are detailed in tables at the back of this chapter. In Phase 1B, implementing the mitigation measures at the key locations mentioned above, would mitigate all significant impacts during all time periods except for the following peak hours and locations discussed below.

During the non-game weekday AM peak hour, of the six ~~seven~~ locations that would be significantly impacted, four ~~three~~ locations would be fully mitigated and two ~~four~~ locations would remain unmitigatable (~~one of which would be vastly improved~~) including the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, ~~the southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place, and~~ the ramp from the northbound Van Wyck Expressway to westbound Northern Boulevard. ~~and the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard. However, due to the proposed mitigation measures, one new location would be slightly impacted—the eastbound Grand Central Parkway mainline between Roosevelt Avenue and the LIE.~~

During the non-game weekday midday peak hour, of the eight locations that would be significantly impacted, five ~~four~~ locations would be fully mitigated and three ~~four~~ locations would remain unmitigatable (~~all one of which would be vastly improved~~) including the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, the southbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, the ramp from eastbound Astoria Boulevard/Grand Central Parkway to the northbound Whitestone Expressway/eastbound Northern Boulevard, the ramp from the westbound Grand Central Parkway toward Stadium Road and the northbound Whitestone Expressway, and the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard. However, due to the proposed mitigation measures, one ~~two~~ new locations would be slightly impacted - ~~including the eastbound Grand Central Parkway mainline between Roosevelt Avenue and the LIE., and the southbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE.~~

During the non-game weekday PM peak hour, of the nine locations that would be significantly impacted, three ~~six~~ locations would be fully mitigated and six ~~three~~ locations would remain unmitigatable including the westbound Grand Central Parkway mainline (the west side, between Roosevelt Avenue and the LIE), the southbound Van Wyck Expressway mainline between

Roosevelt Avenue and the LIE, the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, the ramp from westbound Northern Boulevard to the southbound Van Wyck Expressway, the ramp from eastbound Astoria Boulevard/Grand Central Parkway to the northbound Whitestone Expressway/eastbound Northern Boulevard, and the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard (which would be vastly improved from With Action conditions).

~~However, due to the proposed mitigation measures, one new location would be slightly impacted (the southbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE) and one new location would be more heavily impacted (the ramp from westbound Northern Boulevard to the southbound Van Wyck Expressway).~~

During the Saturday midday peak hour, of the nine ~~10~~ locations that would be significantly impacted, three ~~four~~ locations would be fully mitigated and six locations would remain unmitigatable (three ~~five~~ of which would be vastly improved) including the westbound Grand Central Parkway mainline (the east side, between Roosevelt Avenue and the LIE), the westbound Grand Central Parkway mainline (the west side, between Roosevelt Avenue and the LIE), the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, the ramp from westbound Northern Boulevard to the southbound Van Wyck Expressway, the ramp from eastbound Astoria Boulevard/Grand Central Parkway to the northbound Whitestone Expressway/eastbound Northern Boulevard, and the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard. However, due to the proposed mitigation measures, one new location would be slightly impacted (the southbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE).

Game Day

Resulting highway traffic densities, speeds, and levels of service are detailed in tables at the back of this chapter. In Phase 1B, implementing the mitigation measures at the key locations mentioned above, would mitigate all significant impacts during all time periods except for the ~~following~~ peak hours and locations discussed below.

During the weekday pre-game peak hour, of the three locations that would be significantly impacted, one ~~two~~ locations would be fully mitigated and two ~~one~~ locations would remain unmitigatable—the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE and the southbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE. However, due to the proposed mitigation measures, one ~~two~~ new locations would be slightly impacted ~~including the eastbound Grand Central Parkway mainline between Roosevelt Avenue and the LIE, and — the southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place.~~

During the weekend pre-game peak hour, ~~of the all seven nine~~ locations that would be significantly impacted, ~~five locations would be fully mitigated and all seven four~~ locations would remain unmitigatable ~~(all of which would be vastly improved)~~ including the westbound Grand Central Parkway mainline (the east side, between Roosevelt Avenue and the LIE), the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, the southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place, the ramp from the northbound Van Wyck Expressway to eastbound Northern Boulevard, the ramp from westbound Northern Boulevard to the southbound Van Wyck Expressway, the ramp from westbound Grand Central Parkway toward Stadium Road and northbound Whitestone Expressway, and the ramp from the southbound Whitestone Expressway to westbound Northern

Boulevard. However, due to the proposed mitigation measures, one new location would be slightly impacted—the eastbound Grand Central Parkway mainline between Roosevelt Avenue and the LIE.

During the weekend post-game peak hour, of the four ~~six~~ locations that would be significantly impacted, three ~~four~~ locations would be fully mitigated and one ~~two~~ locations would remain unmitigatable—including the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, and the ramp from eastbound Astoria Boulevard/Grand Central Parkway to the northbound Whitestone Expressway/eastbound Northern Boulevard. However, due to the proposed mitigation measures, one new location would be slightly impacted—the ramp from World's Fair Marina / Boat Basin Road to westbound Grand Central Parkway, the northbound Whitestone Expressway to the southbound Van Wyck Expressway.

HIGHWAY MITIGATION—PHASE 2 (2032)

Non-Game Day

Resulting highway traffic densities, speeds, and levels of service are detailed in tables at the back of this chapter. In Phase 2, implementing the mitigation measures at the key locations mentioned above would mitigate all significant impacts during all time periods except for the following peak hours and locations discussed below.

During the non-game weekday AM peak hour, of the seven locations that would be significantly impacted, two ~~five~~ locations would be fully mitigated and five ~~two~~ locations would remain unmitigatable including the westbound Grand Central Parkway mainline (the west side, between Roosevelt Avenue and the LIE), the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, and the southbound Van Wyck Whitestone Expressway mainline between Northern Boulevard and Linden Place Roosevelt Avenue and the LIE, the ramp from the northbound Van Wyck Expressway to westbound Northern Boulevard, and the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard. However, due to the proposed mitigation measures, one new location would be slightly impacted—the southbound Van Wyck Expressway mainline between Roosevelt Avenue and LIE.

During the non-game weekday midday peak hour, of the nine ~~ten~~ locations that would be significantly impacted, four locations would be fully mitigated and five ~~six~~ locations would remain unmitigatable (three ~~two~~ of which would be vastly improved) including the westbound Grand Central Parkway mainline (the east side, between Roosevelt Avenue and the LIE), the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, the southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place, the ramp from the northbound Van Wyck Expressway to westeastbound Northern Boulevard, the ramp from eastbound Astoria Boulevard/Grand Central Parkway to the northbound Whitestone Expressway/eastbound Northern Boulevard, the ramp from the westbound Grand Central Parkway toward Stadium Road and the northbound Whitestone Expressway, and the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard. However, due to the proposed mitigation measures, two new locations would be slightly impacted including the southbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, and the ramp from westbound Northern Boulevard to the southbound Van Wyck Expressway. and one new location would be more heavily impacted including the ramp from the northbound Whitestone Expressway to the southbound Van Wyck Expressway.

During the non-game weekday PM peak hour, of the nine locations that would be significantly impacted, three locations would be fully mitigated and six locations would remain unmitigatable

(~~two~~ all of which would be vastly improved) including ~~the westbound Grand Central Parkway mainline (the east side, between Roosevelt Avenue and the LIE), the westbound Grand Central Parkway mainline (the west side, between Roosevelt Avenue and the LIE), the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, the southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place, the ramp from westbound Northern Boulevard to the southbound Van Wyck Expressway, the ramp from eastbound Astoria Boulevard/Grand Central Parkway to the northbound Whitestone Expressway/eastbound Northern Boulevard, and the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard.~~ However, due to the proposed mitigation measures, two ~~four~~ new locations would be significantly impacted including the eastbound Grand Central Parkway mainline between Roosevelt Avenue and the LIE, the ramp from the southbound Whitestone Expressway to the westbound Grand Central Parkway, the northbound Whitestone Expressway mainline between Northern Boulevard and Linden Place, the ramp from World's Fair Marina/Boat Basin Road to the westbound Grand Central Parkway, and the ramp from westbound Northern Boulevard to the southbound Van Wyck Expressway.

During the Saturday midday peak hour, of the 10 locations that would be significantly impacted, two locations would be fully mitigated and eight locations would remain unmitigatable (three of which would be vastly improved) including the westbound Grand Central Parkway mainline (the east side, between Roosevelt Avenue and the LIE), the westbound Grand Central Parkway mainline (the west side, between Roosevelt Avenue and the LIE), the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, the southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place, the ramp from the northbound Van Wyck Expressway to eastbound Northern Boulevard, the ramp from westbound Northern Boulevard to the southbound Van Wyck Expressway, the ramp from eastbound Astoria Boulevard/Grand Central Parkway to the northbound Whitestone Expressway/eastbound Northern Boulevard, and the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard. ~~However, due to the proposed mitigation measures, one new location would be slightly impacted the northbound Whitestone Expressway mainline between Northern Boulevard and Linden Place.~~

Game Day

Resulting highway traffic densities, speeds, and levels of service are detailed in tables at the back of this chapter. In Phase 2, implementing the mitigation measures at the key locations mentioned above would mitigate all significant impacts during all time periods except for the ~~following~~ peak hours and locations discussed below.

During the weekday pre-game peak hour, of the six ~~eight~~ locations that would be significantly impacted, one ~~five~~ locations would be fully mitigated and five ~~three~~ locations would remain unmitigatable including the westbound Grand Central Parkway mainline (the east side, between Roosevelt Avenue and the LIE), the westbound Grand Central Parkway mainline (the west side, between Roosevelt Avenue and the LIE), the northbound Van Wyck Expressway mainline between Roosevelt Avenue and LIE, the southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place, and the ramp from the northbound Van Wyck Expressway to eastbound Northern Boulevard.

During the weekend pre-game peak hour, of the six ~~ten~~ locations that would be significantly impacted, two ~~four~~ locations would be fully mitigated and four ~~six~~ locations would remain unmitigatable including the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, the southbound Whitestone Expressway mainline between Northern

~~Boulevard and Linden Place~~, the ramp from the northbound Van Wyck Expressway to eastbound Northern Boulevard, ~~the ramp from the northbound Whitestone Expressway to the southbound Van Wyck Expressway~~, the ramp from westbound Northern Boulevard to the southbound Van Wyck Expressway, and the ramp from westbound Grand Central Parkway toward Stadium Road and northbound Whitestone Expressway. ~~the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard~~. However, due to the proposed mitigation measures, two ~~one~~ new locations would be slightly impacted—the eastbound Grand Central Parkway mainline between Roosevelt Avenue and the LIE and the westbound Grand Central Parkway mainline (the east side, between Roosevelt Avenue and the LIE).

During the weekend post-game peak hour, of the eight ~~nine~~ locations that would be significantly impacted, four locations would be fully mitigated and four ~~five~~ locations would remain unmitigatable (two of which would be vastly improved) including the westbound Grand Central Parkway mainline (the east side, between Roosevelt Avenue and the LIE), the westbound Grand Central Parkway mainline (the west side, between Roosevelt Avenue and the LIE), the northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE, ~~the ramp from the northbound Van Wyck Expressway to eastbound Northern Boulevard~~, and the ramp from eastbound Astoria Boulevard/Grand Central Parkway to the northbound Whitestone Expressway/eastbound Northern Boulevard, ~~the ramp from the westbound Grand Central Parkway toward Stadium Road and the northbound Whitestone Expressway~~, and the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard. However, due to the proposed mitigation measures, three ~~two~~ new locations would be significantly impacted including the northbound Whitestone Expressway mainline between Northern Boulevard and Linden Place, the ramp from World's Fair Marina/Boat Basin Road to the westbound Grand Central Parkway, and the ramp from the northbound Whitestone Expressway to the southbound Van Wyck Expressway.

IMPLEMENTATION

Each of the intersection traffic capacity improvements described in this chapter ~~will require~~ has received approval from various divisions of the New York City Department of Transportation (NYCDOT) such as Highway Design, Signals, and ~~possibly~~ others. Overall, these intersection traffic improvements—including signal phasing and timing changes, traffic signal installations, lane additions, lane re-striping, geometric improvements, channelization improvements and parking prohibitions—fall within the range of typical measures employed by NYCDOT in improving traffic conditions in New York City.

Each of the highway network-related improvements described in this chapter beyond the operational improvements which are under NYCDOT jurisdiction would require a collaborative review process between NYCDOT and the New York State Department of Transportation (NYSDOT), and where appropriate, the New York City Department of Parks and Recreation (NYCDPR) closer to the time of construction when the design of those measures is finalized.

With the implementation of the traffic mitigation measures described above, during Phase 1A, new parking prohibitions would result in the removal of approximately ~~60~~ 66 parking or “standing” spaces during various times of the day and days of the week, including 20 parking meters. Northern Boulevard would lose 14 parking meters near Parsons Boulevard and ~~Prince~~ Union Street; Roosevelt Avenue would lose five spaces (including two parking meters) at 111th Street; 108th Street would lose about 20 spaces near Northern Boulevard and Roosevelt Avenue; 114th Street would lose about ~~seven~~ nine spaces near Northern Boulevard and

Roosevelt Avenue; College Point Boulevard would lose 11 spaces near Roosevelt Avenue; and Parsons Boulevard would lose three spaces near Roosevelt Avenue.

During Phase 1B, new parking prohibitions would result in the removal of approximately ~~94~~ 87 parking or “standing” spaces during various times of the day and days of the week, including 24 parking meters. Astoria Boulevard would lose two parking spaces near 108th Street; Northern Boulevard would lose 24 parking spaces (including 18 parking meters) near Parsons Boulevard, 108th Street, Prince Street, and Union Street; Roosevelt Avenue would lose ~~14~~ 7 spaces (including two parking meters) at 111th Street and ~~Prince~~ 114th Street; 108th Street would lose about 20 spaces near Northern Boulevard and Roosevelt Avenue; 114th Street would lose about ~~seven~~ 13 spaces near Northern Boulevard and Roosevelt Avenue; College Point Boulevard would lose 11 spaces near Roosevelt Avenue; and Parsons Boulevard would lose 10 spaces in the vicinity of Northern Boulevard, Roosevelt Avenue, and Sanford Avenue.

During Phase 2, new parking prohibitions would result in the removal of approximately ~~405~~ 101 parking or “standing” spaces during various times of the day and days of the week, including 24 parking meters. Astoria Boulevard would lose two parking spaces near 108th Street; Northern Boulevard would lose 24 parking spaces (including 18 parking meters) in the vicinity of Parsons Boulevard, 108th Street, Prince Street, and Union Street; Roosevelt Avenue would lose ~~14~~ 7 spaces (including two parking meters) at 111th Street, and 114th Street ~~and Prince Street~~; Sanford Avenue would lose four spaces near Parsons Boulevard; 108th Street would lose about 20 spaces near Northern Boulevard and Roosevelt Avenue; 114th Street would lose about ~~42~~ 18 spaces near Northern Boulevard and Roosevelt Avenue; College Point Boulevard would lose 13 spaces near Roosevelt Avenue and Sanford Avenue; and Parsons Boulevard would lose 13 spaces (including four parking meters) in the vicinity of Northern Boulevard, Roosevelt Avenue, and Sanford Avenue. No designated truck loading/unloading or commercial vehicle zones or bus layover space would be affected by the parking modifications proposed.

Of the traffic mitigation measures discussed above, new traffic signals ~~are proposed~~ have been approved at the following, currently unsignalized, intersections: Boat Basin Road at World’s Fair Marina; the intersection of the Grand Central Parkway westbound exit ramp at West Park Loop/Stadium Road; Willets Point Boulevard at Northern Boulevard; New Willets Point Boulevard at 126th Street; ~~and the intersection of the eastbound Northern Boulevard ramp to 126th Street at the eastbound Astoria Boulevard/Grand Central Parkway ramp to eastbound Northern Boulevard; Northern Boulevard at 126th Place; 126th Street at 36th Avenue; and 126th Street at 37th Avenue;~~ and an upgrade to an actuated signal control at the intersection of Boat Basin Road at Stadium Road. Also, it is expected that the intersection of College Point Boulevard at Sanford Avenue would require traffic signal equipment upgrades from the current mechanical systems to computerized systems in order to accommodate variable signal phase green times among the seven analysis time periods. This signal improvement would be similar to NYCDOT’s planned upgrade program for various signalized intersections throughout the City. ~~Signal warrant analyses will be prepared for the Final SEIS. Should NYCDOT determine that any of the proposed traffic signals are not warranted, alternative means of mitigating significant adverse impacts at those locations will need to be developed or unmitigated impacts may result and would be identified as such in the Final SEIS.~~

In order to verify the need and effectiveness of the proposed mitigation measures proposed in this SEIS (especially the more cost intensive highway network improvements), the developer, in consultation with the lead agency and NYCDOT, will develop and conduct a detailed traffic monitoring plan at the completion of the buildout of each phase of the proposed project. The

developer will inform NYCDOT and the lead agency of the progress of development and submit for NYCDOT's review and approval a scope of work that would include all locations where significant traffic impacts have been identified and any locations analyzed where NYCDOT believes improvement measures may be warranted, including the intersections of Janet Place at Roosevelt Avenue and 39th Avenue at College Point Boulevard, which could be affected by proposed turn prohibitions at Roosevelt Avenue at College Point Boulevard. Data collection conducted for the monitoring plan would include 24-hour Automatic Traffic Recorder (ATR) machine counts, manual turning movement counts, vehicle classification counts, pedestrian counts, intersection geometry and field information, signal timing and signal progression and any relevant information necessary for conducting the traffic monitoring plan. In the areas where parking prohibitions would be needed to mitigate significant impacts, such as Downtown Flushing and Corona, curbside utilization surveys would be conducted to determine the number of vehicles that would be displaced and where the displaced vehicles would be accommodated. Additionally, the traffic monitoring program would include an origin-destination survey performed for the destination retail component of the project. The traffic monitoring program would also include intersection capacity and level of service analyses, and traffic simulations, to determine whether actual future With Action conditions have, in fact, resulted in significant traffic impacts and verify the need for mitigation measures identified in this SEIS or similar measures identified through the traffic monitoring plan.

The developer will submit to NYCDOT and the lead agency design drawings for any mitigation measures as per American Association of State Highway and Transportation Officials (AASHTO) and NYCDOT specifications. NYCDOT will participate in the review process relating to all future modifications to geometric alignment, striping and signage during the preliminary and final design phases. In addition, as mutually agreed upon, the City and the developer will be responsible for any cost associated with the monitoring effort. The developer of each phase of the project will be responsible for the cost of the design and construction of any or all mitigation measures identified in this SEIS, for that phase. **Tables 21-7 through 21-27** show the various LOS with mitigation implemented.

Note: Significant Impact									

E. TRANSIT AND PEDESTRIANS

TRANSIT

As discussed in Chapter 14, “Transportation,” the proposed project would not result in any significant adverse transit impacts by the 2018 Phase 1A completion. However, it would result in significant adverse bus line-haul impacts on the Q19, Q48, and Q66 bus lines and subway line-haul impacts on the No. 7 subway line by the 2028 Phase 1B completion. Upon the proposed project’s full build-out in 2032, significant adverse transit impacts were identified for the Mets-Willets Point subway station stairs, the No. 7 subway line-haul, and Q19, Q48, and Q66 bus line-haul conditions. Potential measures to mitigate these significant adverse impacts are described below.

In addition, it should be noted that if NYCT reverts back to its pre-CitiField station operating plan for the Mets-Willets Point subway station, whereby passage through the station between parking in South Lot/Lot D and the north side of Roosevelt Avenue could be made only within the unpaid zone, additional impacts for the station’s street-level connections and the unpaid zone passageway could occur during game days. Because game-day conditions occur on average only approximately 80 40 to 50 times a year and are subject to game-day traffic and pedestrian management, such impacts would be intermittent and may not require permanent mitigation measures. Furthermore, since the planning and design of this station reconfiguration has not yet taken place, the specific nature of the potential game-day impacts cannot be ascertained and any mitigation measures that may be deemed feasible to address the potential game-day impacts also cannot be identified at this time. If NYCT decides to proceed with this station reconfiguration, which would take place independent of the proposed project, additional interagency coordination is expected to take place to develop the appropriate game-day management strategies. Between the Draft and Final SEIS, no changes to operating plans were announced by NYCT; therefore, any potential changes that may be considered for future implementation will be addressed outside of this environmental review. For purposes of disclosure in this ~~Draft-Final~~ SEIS, any impacts that may be attributed to future passage of a reconfigured Mets-Willets Point subway station may potentially be deemed unmitigatable.

SUBWAY STATION OPERATIONS

2032 Phase 2

The north stairway (S-3) on Roosevelt Avenue would decline from LOS A ($v/c = 0.05$), LOS A ($v/c = 0.26$), and LOS A ($v/c = 0.38$) under the 2032 No Action condition to LOS D ($v/c = 1.21$), LOS D ($v/c = 1.14$), and LOS D ($v/c = 1.20$) under the 2032 With Action condition during the weekday PM non-game, weekday pre-game, and weekend pre-game peak periods respectively. The north stairway (S-2) on Roosevelt Avenue would decline from LOS A ($v/c = 0.04$) under the 2032 No Action condition to LOS D ($v/c = 1.10$) under the 2032 With Action condition during the weekday PM non-game peak period, and the north stairway (M-4) that connects to the mezzanine and street level stairways (S-2 and S-3) on Roosevelt Avenue would decline from LOS A ($v/c = 0.06$), LOS A ($v/c = 0.18$), and LOS A ($v/c = 0.22$) under the 2032 No Action condition to LOS E ($v/c = 1.34$), LOS D ($v/c = 1.10$), and LOS D ($v/c = 1.08$) under the 2032 With Action condition during the weekday PM non-game, weekday pre-game, and weekend pre-game peak periods, respectively. According to the *CEQR Technical Manual*, stairway widenings should result in a total effective width that would be a multiple of 30-inch lanes. ~~As shown in Table 21-28 detailed in the DSEIS,~~ in order to mitigate the above significant adverse stairway impacts, the effective widths of the S-3, S-2, and M-4 stairways would need to be widened from

their current effective widths of 78 inches, 81 inches, and 138 inches to 120 inches, 90 inches, and 210 inches, respectively. In addition, these stairway widenings would need to be accompanied by an Americans with Disabilities Act (ADA)-compliant elevator between the street and mezzanine levels. ~~The feasibility of the stairway widening and elevator installation will be further evaluated between the Draft and Final SEIS. In the event these mitigation measures are determined to be infeasible, the projected significant adverse stairway impacts would be deemed unmitigatable. Subsequent to the certification of the DSEIS, the feasibility of~~ the above stairway widenings was studied. Based on the feasibility study, it was determined that the proposed widening of the M-4 stairway from its effective width of 138 inches to 210 inches would not be feasible due to the existing structures on both sides of the stairway. An alternative mitigation scheme was proposed by widening the S-3 stairway from its current effective width of 78 inches to 120 inches, maintaining the current effective width of the M-4 stairway at 138 inches, and demolishing the existing S-2 stairway and relocating it to the east side of the mezzanine level. The new S-2 stairway would be constructed with an effective width of 90 inches, 9 inches wider than its existing effective width of 81 inches. Relocating the S-2 stairway would divert pedestrian volumes away from the M-4 stairway such that the current effective width of 138 inches would be adequate to accommodate the future projected pedestrian volumes from the widened S-3 stairway. In connection with the relocated and widened S-2 stairway, a new fare array consisting of three turnstiles and one emergency gate would be constructed within the mezzanine level to control access to the new S-2 stairway. The mitigated conditions incorporating this alternative mitigation scheme are summarized in **Table 21-28**. In addition, a street to platform level ADA-compliant elevator would be constructed providing access to the westbound platform of the station. The ADA-compliant elevator would be accompanied by an Autonomous Farecard Access System (AFAS) gate to control access to the station. Furthermore, a manual access gate would be installed at the westbound platform elevator landing to separate the ADA-compliant elevator from the existing turnstiles. The manual access gate would facilitate the current non-game and game day operations at the station. It should be noted that the above proposed mitigation measures could be subject to modification due to NYCT's future master plan for the Mets-Willets Point subway station. Any modifications in conformance with the future master plan would provide equivalent functionalities that would similarly mitigate the stairway impacts identified above. Since the projected impacts that prompted the stairway and elevator feasibility study would not occur until Phase 2 of the proposed project, no funding commitments are in place at this time. The City will coordinate with NYCT and the lead agency to ensure the proper mitigation would be implemented at the appropriate time and would add language to the RFP for Phase 2 of the project as well as to the development agreement and/or other legally binding agreements, requiring the designated developer to fund the implementation of this mitigation. The implementation of these mitigation measures would be coordinated with MTA/NYCT to allow enough time for detailed design and specification approvals by MTA/NYCT and for the construction in order to address the increased demand that would result from development of the proposed project by 2032.

Notes:								
Capacities were calculated based on rates presented in the <i>CEQR Technical Manual</i> (January 2012 edition).								
Surging factors are only applied to the exiting pedestrian volume (<i>CEQR Technical Manual</i>).								
$V/C \text{ Stairway} = [V_{in} / (150 * We * Sf * Ff)] + [V_x / (150 * We * Sf * Ff)]$								
$V/C \text{ Passageway} = [V_{in} / (225 * We * Sf * Ff)] + [V_x / (225 * We * Sf * Ff)]$								
Where								
Vin = Peak 15-minute entering passenger volume								
Vx = Peak 15-minute exiting passenger volume								
We = Effective width of stairs/passageways								
Sf = Surging factor (if applicable)								
Ff = Friction factor (if applicable)								

SUBWAY LINE HAUL LEVELS

2028 Phase 1B

The project-generated subway trips would add approximately five passengers per car to the No. 7 Manhattan-bound express line at the peak load point during the AM peak period, resulting in a v/c ratio of 1.09. It should be noted that in the event NYCT is able to process one additional express train Manhattan-bound during the AM peak hour, as assumed in the DSEIS, this significant adverse line-haul impact on the No. 7 line would not occur. As discussed in Chapter 14, "Transportation," the City had consulted with the MTA on extending regular LIRR service to Willets Point when the actual demand shows that such service improvement is warranted. The addition of regular LIRR service to Willets Point would provide substantial relief to the No. 7 subway line and may prevent this significant adverse subway impact from materializing. Since there are constraints on what service improvements are available to NYCT, the identified significant line-haul capacity impact on the No. 7 line would likely remain unmitigated absent additional train service or the introduction of new LIRR service to the area.

2032 Phase 2

The project-generated subway trips would add approximately 11 passengers per car to the No. 7 subway line-Manhattan-bound express line at the peak load point during the AM peak period, resulting in a v/c ratio of 1.20-1.16. As discussed above for the 2028 Phase 1B completion, in

~~Chapter 14, "Transportation," the City had consulted with the MTA on extending regular LIRR service to Willets Point when the actual demand shows that such service improvement is warranted. The addition of regular LIRR service to Willets Point would provide substantial relief to the No. 7 subway line and may prevent this significant adverse subway impact from materializing. Since there are constraints on what service improvements are available to NYCT, the identified significant line-haul capacity impact on the No. 7 line would likely remain unmitigated absent the introduction of new LIRR service to the area.~~

BUS LINE HAUL LEVELS

2028 Phase 1B

The proposed project would result in significant adverse impacts on the eastbound and westbound Q19 and Q66 routes during the AM and PM peak periods and on the eastbound and westbound Q48 during the PM peak period in 2028. More specifically, the Q19 route would experience the following increases in passengers per bus between the 2028 No Action and With Action conditions:

- Eastbound line-haul increasing from 43 to 65 average passengers per bus in the AM peak period;
- Westbound line-haul increasing from 45 to 61 average passengers per bus in the AM peak period;
- Eastbound line-haul increasing from 28 to 69 average passengers per bus in the PM peak period; and
- Westbound line-haul increasing from 33 to 80 average passengers per bus in the PM peak period.

To mitigate these significant adverse impacts, both the eastbound and westbound Q19 route would require one additional bus (increasing from three to four total buses) during the AM peak period. During the PM peak period, the eastbound route would require one additional bus (increasing from three to four total buses) and the westbound route would require two additional buses (increasing from three to five total buses).

The Q48 route would experience the following increases in passengers per bus between the 2028 No Action and With Action conditions:

- Eastbound line-haul increasing from 22 to 63 average passengers per bus in the PM peak period; and
- Westbound line-haul increasing from 23 to 79 average passengers per bus in the PM peak period.

To mitigate these significant adverse impacts during the PM peak period, the eastbound Q48 route would require one additional bus (increasing from three to four total buses) and the westbound route would require three additional buses (increasing from five to eight total buses).

The Q66 route would experience the following increases in passengers per bus between the 2028 No Action and With Action conditions:

- Eastbound line-haul increasing from 48 to 68 average passengers per bus in the AM peak period;
- Westbound line-haul increasing from 47 to 64 average passengers per bus in the AM peak period;

Willeys Point Development

- Eastbound line-haul increasing from 21 to 78 average passengers per bus in the PM peak period; and
- Westbound line-haul increasing from 21 to 87 average passengers per bus in the PM peak period.

To mitigate these significant adverse impacts, the eastbound Q66 route would require four additional buses (increasing from 15 to 19 total buses) and the westbound route would require three additional buses (increasing from 14 to 17 total buses) during the AM peak period. During the PM peak period, the eastbound route would require five additional buses (increasing from 10 to 15 total buses) and the westbound route would require six additional buses (increasing from 10 to 16 total buses).

Table 21-29 summarizes the average hourly passenger volumes for the Q19, Q48, and Q66 bus routes and provides the numbers of buses required to fully mitigate the identified significant adverse bus line-haul impacts.

Table 21-29
2028 Mitigated Condition: Bus Line Haul Levels

Route	Number of Buses per Hour		Passengers per Bus		
	Existing	Mitigation	Without Action	With Action	Mitigation
AM Peak Period					
Q19 EB	3	4	43	65	49
Q19 WB	3	4	45	61	46
Q66 EB	15	19	48	68	54
Q66 WB	14	17	47	64	53
PM Peak Period					
Q19 EB	3	4	28	69	52
Q19 WB	3	5	33	80	48
Q48 EB	3	4	22	63	47
Q48 WB	5	8	23	79	50
Q66 EB	10	15	21	78	52
Q66 WB	10	16	21	87	54
Notes: Q19, Q48 and Q66 operate standard buses with a guideline capacity of 54 passengers per bus.					

2032 Phase 2

The proposed project would result in significant adverse impacts on the eastbound and westbound Q19 and Q66 routes during the AM and PM peak periods and on the eastbound and westbound Q48 during the PM peak period in 2032. More specifically, the Q19 route would experience the following increases in passengers per bus between the 2032 No Action and With Action conditions:

- Eastbound line-haul increasing from 44 to 77 average passengers per bus in the AM peak period;
- Westbound line-haul increasing from 45 to 74 average passengers per bus in the AM peak period;
- Eastbound line-haul increasing from 29 to 87 average passengers per bus in the PM peak period; and
- Westbound line-haul increasing from 33 to 100 average passengers per bus in the PM peak period.

To mitigate these significant adverse impacts, both the eastbound and westbound Q19 route would require two additional buses (increasing from three to five total buses) during the AM

peak period. During the PM peak period, the eastbound route would require two additional buses (increasing from three to five total buses) and the westbound route would require three additional buses (increasing from three to six total buses).

The Q48 route would experience the following increases in passengers per bus between the 2032 No Action and With Action conditions:

- Eastbound line-haul increasing from 22 to 80 average passengers per bus in the PM peak period; and
- Westbound line-haul increasing from 23 to 103 average passengers per bus in the PM peak period.

To mitigate these significant adverse impacts during the PM peak period, the eastbound Q48 route would require two additional buses (increasing from three to five total buses) and the westbound route would require five additional buses (increasing from five to ten total buses).

The Q66 route would experience the following increases in passengers per bus between the 2032 No Action and With Action conditions:

- Eastbound line-haul increasing from 48 to 79 average passengers per bus in the AM peak period;
- Westbound line-haul increasing from 48 to 77 average passengers per bus in the AM peak period;
- Eastbound line-haul increasing from 21 to 103 average passengers per bus in the PM peak period; and
- Westbound line-haul increasing from 21 to 114 average passengers per bus in the PM peak period.

To mitigate these significant adverse impacts, the eastbound Q66 route would require seven additional buses (increasing from 15 to 22 total buses) and the westbound route would require six additional buses (increasing from 14 to 20 total buses) during the AM peak period. During the PM peak period, the eastbound route would require 10 additional buses (increasing from 10 to 20 total buses) and the westbound route would require 12 additional buses (increasing from 10 to 22 total buses).

Table 21-30 summarizes the average hourly passenger volumes for the Q19, Q48, and Q66 bus routes and provides the numbers of buses required to fully mitigate the identified significant adverse bus line-haul impacts.

The above mitigation measures consider potential service improvements to only the bus routes currently serving the immediate vicinity of Willets West and the District. While MTA and NYCT routinely monitor changes in bus ridership and would make the necessary service adjustments where warranted, the projected service demand is significant in magnitude. These service adjustments are subject to the agencies' fiscal and operational constraints and, if implemented, are expected to take place over time.

Table 21-30
2032 Mitigated Condition: Bus Line Haul Levels

Route	Number of Buses per Hour		Passengers per Bus		
	Existing	Mitigation	Without Action	With Action	Mitigation
AM Peak Period					
Q19 EB	3	5	44	77	46
Q19 WB	3	5	45	74	45
Q66 EB	15	22	48	79	54
Q66 WB	14	20	48	77	54
PM Peak Period					
Q19 EB	3	5	29	87	53
Q19 WB	3	6	33	100	50
Q48 EB	3	5	22	80	48
Q48 WB	5	10	23	103	52
Q66 EB	10	20	21	103	52
Q66 WB	10	22	21	114	52
Notes: Q19, Q48 and Q66 operate standard buses with a guideline capacity of 54 passengers per bus.					

Recognizing that these improvements may not be operationally viable or adequate in accommodating the projected future demand from developments planned for the District, discussions were initiated with the MTA to explore opportunities to extend existing bus routes from adjacent neighborhoods (e.g., downtown Flushing) and/or creating new bus routes. Potential bus service improvements discussed include: 1) increasing service frequency on the Q19 and providing westbound stop/loop service to Willets Point; 2) extending some or all bus routes that currently terminate in downtown Flushing to Willets Point, including the Q12, Q13, Q15/Q15A, Q16, Q26, and Q28; and 3) possibly extending the limited Q50 along Roosevelt Avenue through Willets Point. These potential service improvements would require new bus stops and layover areas in and around the project site. Between the Draft and Final SEIS, additional discussions were initiated with MTA NYCT regarding the potential bus service improvements discussed above. MTA NYCT considered the Q19 westbound loop to serve Willets West and the District to be unfavorable due to its circuitous routing. The MTA Bus Company would consider extending the Q50 and NYCT would consider extending one of the current bus routes terminating in downtown Flushing to Willets West and the District initially. Additional bus route extensions to Willets West and the District would be considered based on future demand. In addition, several conceptual bus routing options were explored to provide the necessary layover areas and stop locations for the potential bus route extensions. MTA NYCT has found the conceptual bus routing options to be generally reasonable and feasible. While no definitive plans have been made at this time, the City and the applicant will continue-is expected to collaborate with the MTA NYCT ~~during and~~ after this environmental review process to ensure that adequate bus service improvements would be implemented, ~~no definitive plans have been made at this time.~~

PEDESTRIANS

As discussed in Chapter 14, "Transportation," significant adverse pedestrian impacts were identified for the east crosswalk at the intersection of Northern Boulevard and 126th Street, the north and west crosswalks at the intersection of Roosevelt Avenue and 126th Street, the north, south, and east crosswalks at the intersection of 34th Avenue and 126th Street, ~~the south crosswalk at the intersection of New Willets Point Boulevard and 126th Street~~ the north and south crosswalks at the intersection of 37th Avenue and 126th Street, and the north crosswalk at the intersection of Roosevelt Avenue and Lot B Driveway. Measures that could be implemented

to mitigate these impacts are discussed below. Because traffic mitigation measures, as described under Section D, “Traffic and Parking” have been proposed for these intersections, pedestrian mitigation analyses were prepared for the “Base Option” for which only crosswalk widenings were considered and the “Traffic Mitigation Option” in conjunction with the proposed traffic mitigation measures. At locations where significant adverse pedestrian impacts were not identified but traffic mitigation measures were proposed, an assessment of the effects of the proposed traffic mitigation measures on pedestrian operations was also conducted. Where appropriate, additional pedestrian mitigation measures were recommended to address potential impacts that may be created by proposed traffic mitigation measures. In addition, related pedestrian analyses ~~will be~~ were prepared for the three intersections (126th Street at 36th Avenue, 126th Street at 37th Avenue, and Northern Boulevard at 126th Place) where additional traffic analyses ~~will be~~ were also ~~be~~ conducted and are presented in ~~the~~ this Final SEIS. Mitigation measures were recommended where appropriate for the additional three intersections. ~~If additional pedestrian impacts are identified, mitigation measures similar to those described for other impacted pedestrian analysis locations, such as crosswalk widenings and those in conjunction with proposed traffic mitigation measures, would be explored to address the impacts, or if no practicable mitigation measures can be identified, the impacts would be disclosed as being unmitigatable.~~

It should be noted that pedestrian volumes at some of the impacted crosswalks could be substantially lower if an areawide bus service improvement is implemented, with some or all of the bus routes discussed above extended to Willets West and within the District. As a result, some of the projected significant adverse pedestrian impacts may not occur or occur to a lesser extent, requiring no or less mitigation. The reduction of pedestrian volumes at these crosswalk locations could also lessen pedestrian conflicts with turning vehicles, thereby potentially lessening the projected traffic impacts and the required traffic mitigation measures. Similar to the proposed traffic mitigation measures, the eventual implementation of the proposed pedestrian mitigation measures would be subject to a monitoring program undertaken by the developer, in consultation with the lead agency and NYCDOT, to determine actual needs upon completion and occupancy of various components and the three phases of the proposed project.

2018 PHASE 1A

Northern Boulevard and 126th Street

Significant adverse pedestrian impacts were identified for the intersection’s east crosswalk, where it would deteriorate to:

- beyond mid-LOS D (15.6 SFP) from a No Action LOS A (5699.3 SFP) during the weekday midday peak period,
- LOS E (14.0 SFP) from a No Action LOS A (5584.8 SFP) during the weekday PM peak period,
- beyond mid-LOS D (16.1 SFP) from a No Action LOS A (625.9 SFP) during the weekday pre-game peak period,
- LOS E (~~14.6~~ 11.7 SFP) from a No Action LOS A (1695.1 SFP) during the weekend midday non-game peak period,
- LOS E (14.7 SFP) from a No Action LOS A (1095.3 SFP) during the weekend pre-game peak period, and

Willetts Point Development

- LOS E (10.7 SFP) from a No Action LOS A (136.4 SFP) during the weekend post-game peak periods.

Potential measures to mitigate these impacts are described below and the mitigated conditions are summarized in **Table 21-31**.

Table 21-31
2018 Mitigated Condition: Pedestrian Level of Service Analysis
Northern Boulevard and 126th Street

Mitigation Measures	Analysis Time Period	No Action		With Action		Mitigated		
		SFP	LOS	SFP	LOS	SFP	LOS	
Base Option								
East Crosswalk—Widening by 10.5 feet from 14 feet to 24.5 feet; may be infeasible, hence impacts could be unmitigatable	WD	Midday	5699.3	A	15.6	E D	28.6	C
		PM	5584.8	A	14.0	E	25.7	C
		Pre-Game	625.9	A	16.1	D	29.4	C
	WE	Midday Non-Game	1695.1	A	44.6 11.7	E	21.4	D
		Pre-Game	1095.3	A	46.1 14.7	D E	27.0	C
		Post-Game	136.4	A	44.7 10.7	E	19.6	D
Traffic Mitigation Option								
<u>Relocating existing crosswalk to 126th Place and widening to 20.0 feet</u>	<u>WD</u>	<u>Midday</u>	<u>5699.3</u>	<u>A</u>	<u>15.6</u>	<u>D</u>	<u>51.1</u>	<u>B</u>
		<u>PM</u>	<u>5584.8</u>	<u>A</u>	<u>14.0</u>	<u>E</u>	<u>49.9</u>	<u>B</u>
		<u>Pre-Game</u>	<u>625.9</u>	<u>A</u>	<u>16.1</u>	<u>D</u>	<u>56.5</u>	<u>B</u>
	<u>WE</u>	<u>Midday Non-Game</u>	<u>1695.1</u>	<u>A</u>	<u>11.7</u>	<u>E</u>	<u>34.7</u>	<u>C</u>
		<u>Pre-Game</u>	<u>1095.3</u>	<u>A</u>	<u>14.7</u>	<u>E</u>	<u>49.3</u>	<u>B</u>
		<u>Post-Game</u>	<u>136.4</u>	<u>A</u>	<u>10.7</u>	<u>E</u>	<u>51.8</u>	<u>B</u>
Relocating existing crosswalk and designing/constructing new signalized crossing at 126th Place								
Note: SFP = square feet per pedestrian; WD = weekday; WE = weekend.								

Base Option

The significant adverse pedestrian impacts could be fully mitigated by restriping the width of this crosswalk from 14.0 feet to 24.5 feet. Because this widening could be constrained by the physical median along Northern Boulevard, achieving such widening may not be feasible. If determined to be infeasible, the projected significant adverse impacts at this crosswalk would be either partially mitigated or unmitigated.

Traffic Mitigation Option

As part of the proposed traffic mitigation, a quick-curb would be installed on the westbound approach between the right-most lane and center lane to allow the Van Wyck and Whitestone Expressway Ramp to bypass the signal and operate as free flow through the intersection. As a result, pedestrian crossing at this location would need to be eliminated and the existing westbound Northern Boulevard Q66 bus stop relocated. ~~A potential location to which this bus stop can be relocated is under the highway overpass approximately 400 feet upstream (east of the existing location) across from 126th Place. Coupled with this bus stop relocation, a new 20.0-foot-wide crosswalk would be installed, pedestrian crossing of appropriate width accompanied by a new signal of adequate crossing time would need to be designed and constructed to facilitate crossing between the south and north sides of Northern Boulevard at 126th Place. The significant adverse pedestrian impacts could be fully mitigated with these measures in place. If the relocated bus stop and/or the new signalized crossing are deemed impractical, westbound Q66 bus riders would need to be shifted to the westbound Q48 bus route along Roosevelt Avenue. This shift would alter the area's pedestrian circulation patterns,~~ This bus stop would be relocated to a location under the highway overpass approximately 400 feet upstream (east of the existing location) across from 126th Place. Coupled with this bus stop relocation, a new 20.0-foot-wide crosswalk would be installed, pedestrian crossing of appropriate width accompanied by a new signal of adequate crossing time would need to be designed and constructed to facilitate crossing between the south and north sides of Northern Boulevard at 126th Place. The significant adverse pedestrian impacts could be fully mitigated with these measures in place. If the relocated bus stop and/or the new signalized crossing are deemed impractical, westbound Q66 bus riders would need to be shifted to the westbound Q48 bus route along Roosevelt Avenue. This shift would alter the area's pedestrian circulation patterns,

~~resulting in new or worse significant adverse pedestrian impacts at other study area analysis locations, and/or significant adverse bus impacts on the westbound Q48 route.~~

Roosevelt Avenue and 126th Street

A significant adverse pedestrian impact was identified for the intersection's west crosswalk, where it would deteriorate to LOS F (-67.6 SFP) from a No Action LOS A (194.6 SFP) during the weekend post-game peak period. Potential measures to mitigate this impact are described below and the mitigated conditions are summarized in **Table 21-32**.

Table 21-32

2018 Mitigated Condition: Pedestrian Level of Service Analysis
Roosevelt Avenue and 126th Street

Mitigation Measures	Analysis Time Period		No Action		With Action		Mitigated	
			SFP	LOS	SFP	LOS	SFP	LOS
Base Option								
West Crosswalk – Game-day traffic management	WE	Post-Game	194.6	A	-67.6	F	--	--
Traffic Mitigation Option								
West Crosswalk – Traffic mitigation and game-day traffic management	WE	Post-Game	194.6	A	-67.6	F	344.9	A
Note: SFP = square feet per pedestrian; WD = weekday; WE = weekend.								

Base Option

No practical crosswalk widening can be implemented to mitigate the above significant adverse pedestrian impact during the weekend post-game peak period. However, game-day traffic management measures—such as the stationing of traffic control officers at this location to facilitate traffic and pedestrian flows, which currently occurs on game days but was not accounted for in the pedestrian analysis—would be in place. Therefore, no mitigation measures are proposed and game-day traffic management is expected to continue to facilitate traffic and pedestrian movements at this location.

Traffic Mitigation Option

This significant adverse pedestrian impact could be fully mitigated by implementing the recommended traffic signal timing adjustments. The recommended signal timing modifications for the remaining peak periods would not alter the conclusions made for the pedestrian impact analyses, nor would they result in the potential for any additional significant adverse pedestrian impacts.

34th Avenue and 126th Street

Significant adverse pedestrian impacts were identified for the intersection's north, south, and east crosswalks. The north crosswalk would deteriorate to beyond mid-LOS D (17.9 SFP) from a No Action LOS A (2714.0 SFP) during the weekend midday non-game peak period. The south crosswalk would deteriorate to:

- beyond mid-LOS D (16.5 SFP) from a No Action LOS A (5848.7 SFP) during the weekday midday peak period,
- beyond mid-LOS D (18.1 SFP) from a No Action LOS A (3183.4 SFP) during the weekday PM peak period,
- LOS E (11.8 SFP) from a No Action LOS A (1217.7 SFP) during the weekend midday non-game peak period, and

Willeys Point Development

- LOS E (14.1 SFP) from a No Action LOS D (23.0 SFP) during the weekend pre-game peak period.

The east crosswalk would deteriorate to

- LOS E (10.4 SFP) from a No Action LOS A (80.0 SFP) during the weekday pre-game peak period,
- LOS E (~~14.1~~ 14.3 SFP) from a No Action LOS A (820.4 SFP) during the weekend midday non-game peak period, and
- LOS E (11.4 SFP) from a No Action LOS A (9899.0 SFP) during the weekend pre-game peak period.

Potential measures to mitigate these impacts are described below and the mitigated conditions are summarized in **Table 21-33**.

Table 21-33
2018 Mitigated Condition: Pedestrian Level of Service Analysis
34th Avenue and 126th Street

Mitigation Measures	Analysis Time Period		No Action		With Action		Mitigated	
			SFP	LOS	SFP	LOS	SFP	LOS
Base Option								
North Crosswalk—Widening by 1.5 feet from 12.5 feet to 14 feet	WE	Midday Non-Game	2714.0	A	17.9	D	20.2	D
South Crosswalk—Widening by 6.5 feet from 10.5 feet to 17 feet	WD	Midday	5848.7	A	16.5	D	27.4	C
		PM	3183.4	A	18.1	D	30.0	C
	WE	Midday Non-Game	1217.7	A	11.8	E	14.3 <u>19.8</u>	E <u>D</u>
		Pre-Game	23.0	D	14.1	E	23.7	D
East Crosswalk—Widening by 6 feet from 7 feet to 13 feet	WD	Pre-Game	80.0	A	10.4	E	20.4	D
	WE	Midday Non-Game	820.4	A	14.1 <u>14.3</u>	E	27.8	C
		Pre-Game	9899.0	A	11.4	E	22.2	D
Traffic Mitigation Option								
East Crosswalk—Widening by 7-2.5 feet from 7 feet to <u>14-9.5</u> feet	WD	Pre-Game	80.0	A	10.4	E	28.4 <u>20.5</u>	C <u>D</u>
	WE	Midday Non-Game	820.4	A	14.1 <u>14.3</u>	E	20.5 <u>19.8</u>	D <u>D</u>
		Pre-Game	9899.0	A	11.4	E	37.1 <u>23.3</u>	C <u>D</u>
Note: SFP = square feet per pedestrian; WD = weekday; WE = weekend.								

Base Option

The significant adverse pedestrian impacts could be fully mitigated by restriping the width of the north crosswalk from 12.5 feet to 14.0 feet, the south crosswalk from 10.5 feet to 17.0 feet, and the east crosswalk from 7.0 feet to 13.0 feet.

Traffic Mitigation Option

The significant adverse pedestrian impacts could be fully mitigated by restriping the width of the east crosswalk from 7.0 feet to ~~14.0~~ 9.5 feet in conjunction with the proposed traffic mitigation measures. No crosswalk widening would be required for the north and south crosswalks.

Roosevelt Avenue and 114th Street

No significant adverse pedestrian impacts were identified at this intersection. The recommended signal timing modifications as part of the traffic mitigation would not alter the conclusions made

for the pedestrian impact analyses, nor would they result in the potential for any additional significant adverse pedestrian impacts.

37th Avenue and 126th Street

Significant adverse pedestrian impacts were identified for the intersection's north and south crosswalks. The north crosswalk would operate at LOS E (8.2 SFP), LOS E (8.6 SFP), and beyond mid-LOS D (18.4 SFP) during the weekday pre-game, weekend pre-game, and weekend post-game peak periods, respectively. The south crosswalk would operate at LOS E (8.6 SFP) and LOS E (9.3 SFP) during the weekday pre-game and weekend pre-game peak periods, respectively. Since no traffic impacts requiring mitigation were identified for this intersection, the significant adverse pedestrian impacts could be fully mitigated under the Base Option, by restriping the width of the north crosswalk from 15.0 feet to 31.0 and the south crosswalk from 15.0 feet to 30.0 feet, as summarized in **Table 21-34**. However, during the game-day conditions, traffic management measures—such as the stationing of traffic control officers to facilitate traffic and pedestrian flows—would be in place. These measures make it unlikely that the physical widening of the north and south crosswalks would be needed. Also, as detailed below under “2028 Phase 1B” and “2032 Phase 2,” the north and south crosswalks at this intersection would not be impacted in the later phases because the interim surface parking within the District would have been permanently replaced by the new South Lot/Lot D garages. Therefore, CitiField patrons who in Phase 1A have to cross 126th Street at this intersection's north and south crosswalks to access the stadium would instead access the stadium via the Mets-Willets Point subway station in the later phases.

Table 21-34
2018 Mitigated Condition: Pedestrian Level of Service Analysis
37th Avenue and 126th Street

Mitigation Measures	Analysis Time Period	No Action		With Action		Mitigated		
		SFP	LOS	SFP	LOS	SFP	LOS	
Base Option								
North Crosswalk – Widening by 16 feet from 15 feet to 31 feet; game-day traffic management	WD	Pre-Game	==	==	8.2	E	19.8	D
	WE	Pre-Game	==	==	8.6	E	20.6	D
		Post-Game	==	==	18.4	D	43.6	B
South Crosswalk – Widening by 15 feet from 15 feet to 30 feet; game-day traffic management	WD	Pre-Game	==	==	8.6	E	20.2	D
	WE	Pre-Game	==	==	9.3	E	21.7	D
Note: SFP = square feet per pedestrian; WD = weekday; WE = weekend.								

36th Avenue and 126th Street

No significant adverse pedestrian impacts were identified at this intersection; therefore, no mitigation measures are needed.

2028 PHASE 1B

Northern Boulevard and 126th Street

Significant adverse pedestrian impacts were identified for the intersection's east crosswalk, where it would deteriorate to:

- LOS F (4.9 SFP) from a No Action LOS A (5656.4 SFP) during the weekday midday peak period,

Willetts Point Development

- LOS F (4.8 SFP) from a No Action LOS A (5527.5 SFP) during the weekday PM peak period,
- LOS F (6.5 SFP) from a No Action LOS A (584.6 SFP) during the weekday pre-game peak period,
- LOS F (4.7 SFP) from a No Action LOS A (1681.7 SFP) during the weekend midday non-game peak period,
- LOS F (5.7 SFP) from a No Action LOS A (1086.8 SFP) during the weekend pre-game peak period, and
- LOS F (-2.7 SFP) from a No Action LOS A (130.4 SFP) during the weekend post-game peak period.

Potential measures to mitigate these impacts are described below and the mitigated conditions are summarized in **Table 21-3435**.

Table 21-3435

		Pre-Game	584.6	A	6.5	F	26.4	C
	WE	Midday Non-Game	1681.7	A	4.7	F	19.5	D
		Pre-Game	1086.8	A	5.7	F	23.5	D
		Post-Game	130.4	A	-2.7	F	--	--
Traffic Mitigation Option								
<u>Relocating existing crosswalk to 126th Place and widening to 22.5 feet</u>	<u>WD</u>	<u>Midday</u>	<u>5656.4</u>	<u>A</u>	<u>4.9</u>	<u>E</u>	<u>23.5</u>	<u>D</u>
		<u>PM</u>	<u>5527.5</u>	<u>A</u>	<u>4.8</u>	<u>F</u>	<u>24.5</u>	<u>C</u>
		<u>Pre-Game</u>	<u>584.6</u>	<u>A</u>	<u>6.5</u>	<u>F</u>	<u>31.1</u>	<u>C</u>
	<u>WE</u>	<u>Midday Non-Game</u>	<u>1681.7</u>	<u>A</u>	<u>4.7</u>	<u>E</u>	<u>19.8</u>	<u>D</u>
		<u>Pre-Game</u>	<u>1086.8</u>	<u>A</u>	<u>5.7</u>	<u>F</u>	<u>26.3</u>	<u>C</u>
		<u>Post-Game</u>	<u>130.4</u>	<u>A</u>	<u>-2.7</u>	<u>F</u>	<u>29.0</u>	<u>C</u>
Relocating existing crosswalk and designing/construction new signalized crossing at 126th Place								
Note: SFP = square feet per pedestrian; WD = weekday; WE = weekend.								

Base Option

The significant adverse pedestrian impacts could be fully mitigated by restriping the width of this crosswalk from 14.0 feet to 50.0 feet. Because this widening could be constrained by the physical median along Northern Boulevard, as well as available sidewalk landing on each side of Northern Boulevard, achieving such widening may not be feasible. If determined to be infeasible, the projected significant adverse impacts at this crosswalk would be either partially mitigated or unmitigated.

Traffic Mitigation Option

As detailed above under “2018 Phase 1A,” as part of the proposed traffic mitigation, pedestrian crossing at this location would need to be eliminated and the existing westbound Northern Boulevard Q66 bus stop relocated. ~~A potential location to which this bus stop can be~~ This bus stop can be relocated ~~is~~ under the highway overpass approximately 400 feet upstream (east of the existing location) across from 126th Place. Coupled with this bus stop relocation, a new 22.5-foot-wide crosswalk would be installed, pedestrian crossing of appropriate width accompanied by a new signal of adequate crossing time ~~would need to be designed and constructed~~ to facilitate crossing

between the south and north sides of Northern Boulevard at 126th Place. The significant adverse pedestrian impacts could be fully mitigated with these measures in place. If the relocated bus stop and/or the new signalized crossing are deemed impractical, westbound Q66 bus riders would need to be shifted to the westbound Q48 bus route along Roosevelt Avenue. This shift would alter the area's pedestrian circulation patterns, resulting in new or worse significant adverse pedestrian impacts at other study area analysis locations, and/or significant adverse bus impacts on the westbound Q48 route.

Roosevelt Avenue and 126th Street

Significant adverse pedestrian impacts were identified for the intersection's west crosswalk, where it would deteriorate to:

- LOS F (-22.6 -40.9 SFP) from a No Action LOS A (152.5 SFP) during the weekday pre-game peak period, and
- LOS F (-22.4 -34.7 SFP) from a No Action LOS A (103.2 SFP) during the weekend pre-game peak period.

Potential measures to mitigate these impacts are described below and the mitigated conditions are summarized in **Table 21-3536**.

Table 21-3536
2028 Mitigated Condition: Pedestrian Level of Service Analysis
Roosevelt Avenue and 126th Street

Mitigation Measures	Analysis Time Period		No Action		With Action		Mitigated	
			SFP	LOS	SFP	LOS	SFP	LOS
Base Option								
West Crosswalk—Game-day traffic management	WD	Pre-Game	152.5	A	-22.6 <u>-40.9</u>	F	--	--
	WE	Pre-Game	103.2	A	-22.4 <u>-34.7</u>	F	--	--
Traffic Mitigation Option								
West Crosswalk—Traffic mitigation and game-day traffic management	WD	Pre-Game	152.5	A	-22.6 <u>-40.9</u>	F	--	--
	WE	Pre-Game	103.2	A	-22.4 <u>-34.7</u>	F	--	--
North Crosswalk—Impacted by traffic mitigation; widening by 6.5 <u>4</u> feet from 16 feet to 22.5 <u>20</u> feet	WD	Midday	1660.5	A	18.3	D	27.0	C
		PM	2683.6	A	13.4	E	19.9	D
	WE	Midday Non-Game	1181.0	A	16.4	D	24.2	C
		Post-Game	545.7		15.4		19.8	D
Note: SFP = square feet per pedestrian; WD = weekday; WE = weekend.								

Base Option

No practical crosswalk widening can be implemented to mitigate the above significant adverse pedestrian impact during the weekday pre-game and weekend pre-game peak periods. However, game-day traffic management measures—such as the stationing of traffic control officers at this location to facilitate traffic and pedestrian flows, which currently occurs on game days but was not accounted for in the pedestrian analysis—would be in place. Therefore, no mitigation measures are proposed and game-day traffic management is expected to continue to facilitate traffic and pedestrian movements at this location.

Traffic Mitigation Option

The recommended traffic signal timing modifications would deteriorate the service levels at the intersection's crosswalks during all time periods and create additional significant adverse

pedestrian impacts for the north crosswalk during the ~~weekday midday, weekday PM, and weekend midday non-game~~ post-game peak periods. The impacts on the north crosswalk could be fully mitigated by restriping the crosswalk from 16.0 feet to ~~22.5~~ 20.0 feet. During game-day conditions, traffic management measures—such as the stationing of traffic control officers at this location to facilitate traffic and pedestrian flows, which currently occurs on game days but was not accounted for in the pedestrian analysis—would be in place. Therefore, no mitigation measures are proposed and game-day traffic management is expected to continue to facilitate traffic and pedestrian movements at this location.

34th Avenue and 126th Street

Significant adverse pedestrian impacts were identified for the intersection's north, south, and east crosswalks. The north crosswalk would deteriorate to:

- beyond mid-LOS D (16.2 SFP) from a No Action LOS A (2139.3 SFP) during the weekday PM peak period, and
- LOS E (13.7 SFP) from a No Action LOS A (2704.6 SFP) during the weekend midday non-game peak period.

The south crosswalk would deteriorate to:

- LOS E (9.9 SFP) from a No Action LOS A (5783.6 SFP) during the weekday midday peak period,
- LOS E (14.7 SFP) from a No Action LOS A (3158.9 SFP) during the weekday PM peak period,
- LOS E (8.4 SFP) from a No Action LOS A (1207.9 SFP) during the weekend midday non-game peak period, and
- beyond mid-LOS D (19.1 SFP) from a No Action LOS D (21.9 SFP) during the weekend pre-game peak period.

The east crosswalk would deteriorate to:

- beyond mid-LOS D (18.8 SFP) from a No Action LOS A (2035.8 SFP) during the weekday AM peak period,
- LOS F (6.2 SFP) from a No Action LOS A (1502.7 SFP) during the weekday midday peak period,
- LOS F (6.9 SFP) from a No Action LOS A (937.3 SFP) during the weekday PM peak period,
- LOS F (3.8 SFP) from a No Action LOS A (78.0 SFP) during the weekday pre-game peak period,
- LOS F (5.3 SFP) from a No Action LOS A (756.1 SFP) during the weekend midday non-game peak period,
- LOS F (4.2 SFP) from a No Action LOS A (9927.5 SFP) during the weekend pre-game peak period, and
- LOS F (5.1 SFP) from a No Action LOS A during the weekend post-game peak period.

Potential measures to mitigate these impacts are described below and the mitigated conditions are summarized in **Table 21-~~36~~37**.

Table 21-3637

		Pre-Game	9927.5	A	4.2	F	15.2 22.9	D
		Post-Game	N/A	A	5.1	F	19.4 37.8	D C
Notes: SFP = square feet per pedestrian; WD = weekday; WE = weekend. N/A = Crosswalk volume is zero, and SFP is not calculable. LOS is assumed to be A.								

Base Option

The significant adverse pedestrian impacts could be fully mitigated by restriping the width of the north crosswalk from 12.5 feet to 18.0 feet, the south crosswalk from 10.5 feet to 23.5 feet, and the east crosswalk from 7.0 feet to 28.0 feet.

Traffic Mitigation Option

The significant adverse pedestrian impacts could be fully mitigated by restriping the width of the south crosswalk from 10.5 feet to 17.0 feet and the east crosswalk from 7.0 feet to ~~35.0~~ 31.5 feet for the non game conditions and 43.5 feet for the game day conditions in conjunction with the proposed traffic mitigation measures. ~~During the game-day conditions, traffic management measures—such as the stationing of traffic control officers at this location to facilitate traffic and pedestrian flows, which currently occurs on game days but was not accounted for in the pedestrian analysis—would be in place. These measures make it unlikely that the physical widening of the east crosswalk to 43.5 feet would be needed.~~

Roosevelt Avenue and 114th Street

No significant adverse pedestrian impacts were identified at this intersection. The recommended signal timing modifications as part of the traffic mitigation would not alter the conclusions made for the pedestrian impact analyses, nor would they result in the potential for any additional significant adverse pedestrian impacts.

New Willeys Point Boulevard and 126th Street

No significant adverse pedestrian or traffic impacts were identified at this intersection; therefore, no mitigation measures are needed.

37th Avenue and 126th Street

No significant adverse pedestrian impacts were identified at this intersection; therefore, no mitigation measures are needed. The recommended traffic mitigation would not alter the conclusions made for the pedestrian impact analyses, nor would they result in the potential for any additional significant adverse pedestrian impacts.

36th Avenue and 126th Street

No significant adverse pedestrian impacts were identified at this intersection; therefore, no mitigation measures are needed. The recommended traffic mitigation would not alter the conclusions made for the pedestrian impact analyses, nor would they result in the potential for any additional significant adverse pedestrian impacts.

2032 PHASE 2

Northern Boulevard and 126th Street

Significant adverse pedestrian impacts were identified for the intersection's east crosswalk, where it would deteriorate to:

- LOS E (12.0 SFP) from a No Action LOS A (6403.9 SFP) during the weekday AM peak period,
- LOS F (2.3 SFP) from a No Action LOS A (5642.1 SFP) during the weekday midday peak period,
- LOS F (2.2 SFP) from a No Action LOS A (5513.2 SFP) during the weekday PM peak period,
- LOS F (3.5 SFP) from a No Action LOS A (583.0 SFP) during the weekday pre-game peak period,
- LOS F (2.5 SFP) from a No Action LOS A (1672.8 SFP) during the weekend midday non-game peak period,
- LOS F (3.2 SFP) from a No Action LOS A (1083.9 SFP) during the weekend pre-game peak period, and
- LOS F (-2.9 SFP) from a No Action LOS A (129.6 SFP) during the weekend post-game peak period.

Potential measures to mitigate these impacts are described below and the mitigated conditions are summarized in **Table 21-3738**.

Table 21-3738

		Pre-Game	1083.9	A	3.2	F	28.2	C
	Post-Game	129.6	A	-2.9	F	--	--	
Traffic Mitigation Option								
Relocating existing crosswalk to 126th Place and widening to 30 feet	WD	AM	6403.9	A	12.0	E	49.9	B
		Midday	5642.1	A	2.3	F	21.5	D
		PM	5513.2	A	2.2	F	22.7	D
		Pre-Game	583.0	A	3.5	F	30.0	C
	WE	Midday Non-Game	1672.8	A	2.5	F	19.9	D
		Pre-Game	1083.9	A	3.2	F	25.9	C
		Post-Game	129.6	A	-2.9	F	28.3	C
Relocating existing crosswalk and designing/constructing new signalized crossing at 126th Place								
Note: SFP = square feet per pedestrian; WD = weekday; WE = weekend.								

Base Option

The significant adverse pedestrian impacts could be fully mitigated by restriping the width of this crosswalk from 14.0 feet to 97.0 feet. Because this widening could be constrained by the physical median along Northern Boulevard, as well as available sidewalk landing on each side of Northern Boulevard, achieving such widening may not be feasible. If determined to be infeasible, the projected significant adverse impacts at this crosswalk would be either partially mitigated or unmitigated.

Traffic Mitigation Option

As detailed above under “2018 Phase 1A,” as part of the proposed traffic mitigation, pedestrian crossing at this location would need to be eliminated and the existing westbound Northern Boulevard Q66 bus stop relocated. ~~A potential location to which this bus stop can~~ This bus stop can ~~would be~~ relocated ~~is~~ under the highway overpass approximately 400 feet upstream (east of the existing location) across from 126th Place. Coupled with this bus stop relocation, a new 30.0-foot-wide crosswalk would be installed, pedestrian crossing of appropriate width accompanied by a new signal of adequate crossing time ~~would need to be designed and constructed~~ to facilitate crossing between the south and north sides of Northern Boulevard at 126th Place. The significant adverse pedestrian impacts could be fully mitigated with these measures in place. If the relocated bus stop and/or the new signalized crossing are deemed impractical, westbound Q66 bus riders would need to be shifted to the westbound Q48 bus route along Roosevelt Avenue. This shift would alter the area’s pedestrian circulation patterns, resulting in new or worse significant adverse pedestrian impacts at other study area analysis locations, and/or significant adverse bus impacts on the westbound Q48 route.

Roosevelt Avenue and 126th Street

Significant adverse pedestrian impacts were identified for the intersection’s west and north crosswalks. The west crosswalk would deteriorate to:

Willeys Point Development

- LOS ~~E-F~~ (~~8.0~~ 6.7 SFP) from a No Action LOS A (1560.4 SFP) during the weekday midday peak period,
- LOS F (~~4.4~~ 2.6 SFP) from a No Action LOS A (2031.8 SFP) during the weekday PM peak period,
- LOS F (~~4.8~~ 7.4 SFP) from a No Action LOS A (149.4 SFP) during the weekday pre-game peak period,
- LOS F (~~5.7~~ 4.3 SFP) from a No Action LOS A (1072.1 SFP) during the weekend midday non-game peak period,
- LOS F (~~4.0~~ 5.4 SFP) from a No Action LOS A (99.5 SFP) during the weekend pre-game peak period, and
- LOS ~~E-F~~ (~~9.6~~ 7.8 SFP) from a No Action LOS A (183.4 SFP) during the weekend post-game peak period.

The north crosswalk would deteriorate to:

- beyond mid-LOS D (~~16.4~~ 16.3 SFP) from a No Action LOS A (2680.2 SFP) during the weekday PM peak period, and
- beyond mid-LOS D (~~17.4~~ 17.3 SFP) from a No Action LOS A (537.3 SFP) during the weekend post-game peak period.

Potential measures to mitigate these impacts are described below and the mitigated conditions are summarized in **Table 21-3839**.

Base Option

The significant adverse pedestrian impacts for the west crosswalk could be fully mitigated by restriping the width of the crosswalk from 13.5 feet to ~~50.5~~ 84.0 feet for the non-game day and the weekend post-game conditions. The feasibility of this widening would be limited by the width of the adjoining sidewalks. If such widening could not be achieved, the projected significant adverse impacts during certain time periods would remain unmitigated or partially mitigated. During game-day conditions, traffic management measures—such as the stationing of traffic control officers at this location to facilitate traffic and pedestrian flows, which currently occurs on game days but was not accounted for in the pedestrian analysis—would be in place. Therefore, game-day traffic management is expected to continue to facilitate traffic and pedestrian movements at this location and in conjunction with the proposed crosswalk widening should mitigate the significant adverse pedestrian impacts during the weekday and weekend pre-game conditions. For the north crosswalk, the projected significant adverse pedestrian impacts could be fully mitigated by restriping the crosswalk from 16.0 feet to 19.0 feet.

Note: SFP = square feet per pedestrian; WD = weekday; WE = weekend.								

Traffic Mitigation Option

The recommended traffic signal timing modifications would create additional adverse pedestrian impacts for the north crosswalk during the weekday AM, weekday midday, ~~and weekend midday non-game, and weekend pre-game~~ peak periods ~~and the east crosswalk during the weekday midday peak period~~. The impacts on the north crosswalk could be fully mitigated by restriping the crosswalk from 16.0 feet to 25.5 31.0 feet ~~and the east crosswalk could be fully~~

~~mitigated by restriping the crosswalk from 14.0 feet to 16.0 feet.~~ The west crosswalk during non-game conditions could be fully mitigated by restriping the crosswalk from 13.5 feet to ~~29.0~~ 27.5 feet. The feasibility of this widening would be limited by the width of the adjoining sidewalks. If such widening could not be achieved, the projected significant adverse impacts during certain time periods would remain unmitigated or partially mitigated. During game-day conditions, traffic management measures—such as the stationing of traffic control officers at this location to facilitate traffic and pedestrian flows, which currently occurs on game days but was not accounted for in the pedestrian analysis—would be in place.

34th Avenue and 126th Street

Significant adverse pedestrian impacts were identified for the intersection's north, south, and east crosswalks. The north crosswalk would deteriorate to:

- beyond mid-LOS D (16.8 SFP) from a No Action LOS A during the weekday midday peak period,
- LOS E (9.7 SFP) from a No Action LOS A (2131.7 SFP) during the weekday PM peak period, and
- LOS F (8.0 SFP) from a No Action LOS A (2699.8 SFP) during the weekend midday non-game peak period.

The south crosswalk would deteriorate to:

- LOS E (13.9 SFP) from a No Action LOS A (2947.4 SFP) during the weekday AM peak period,
- LOS F (1.9 SFP) from a No Action LOS A (5767.3 SFP) during the weekday midday peak period,
- LOS F (6.8 SFP) from a No Action LOS A (3150.8 SFP) during the weekday PM peak period, and
- LOS F (3.4 SFP) from a No Action LOS A (1204.7 SFP) during the weekend midday non-game peak period.

The east crosswalk would deteriorate to:

- LOS E (10.6 SFP) from a No Action LOS A (2035.8 SFP) during the weekday AM peak period,
- LOS F (4.6 SFP) from a No Action LOS A (1394.7 SFP) during the weekday midday peak period,
- LOS F (4.8 SFP) from a No Action LOS A (937.3 SFP) during the weekday PM peak period,
- LOS F (3.0 SFP) from a No Action LOS A (76.9 SFP) during the weekday pre-game peak period,
- LOS F (3.7 SFP) from a No Action LOS A (755.4 SFP) during the weekend midday non-game peak period,
- LOS F (3.3 SFP) from a No Action LOS A (9908.5 SFP) during the weekend pre-game peak period, and
- LOS F (5.4 SFP) from a No Action LOS A during the weekend post-game peak period.

Potential measures to mitigate these impacts are described below and the mitigated conditions are summarized in **Table 21-3940**.

Table 21-3940
2032 Mitigated Condition: Pedestrian Level of Service Analysis
34th Avenue and 126th Street

Mitigation Measures	Analysis Time Period	No Action		With Action		Mitigated		
		SFP	LOS	SFP	LOS	SFP	LOS	
Base Option								
North Crosswalk—Widening by 17.5 feet from 12.5 feet to 30 feet	WD	Midday	N/A	A	16.8	D	41.3	B

Notes: SFP = square feet per pedestrian; WD = weekday; WE = weekend. N/A = Crosswalk volume is zero, and SFP is not calculable. LOS is assumed to be A.								

Base Option

No practical crosswalk widening can be implemented to mitigate the above significant adverse pedestrian impact on the south crosswalk during the non-game peak periods. However, the significant adverse pedestrian impacts identified on the north and east crosswalks could be fully mitigated by restriping the width of the north crosswalk from 12.5 feet to 30.0 feet and the east crosswalk from 7.0 feet to 33.0 feet.

Willetts Point Development

Traffic Mitigation Option

The significant adverse pedestrian impacts could be fully mitigated by restriping the width of the north crosswalk from 12.5 feet to ~~22.0~~ 13.0 feet, ~~the south crosswalk from 10.5 feet to 28.5 feet,~~ and the east crosswalk from 7.0 feet to 42.0 in conjunction with the proposed traffic mitigation measures. The feasibility of these widenings would be limited by the width of the adjoining sidewalks. In particular for the intersection's east crosswalk, if the above widening could not be achieved, the projected significant adverse impacts during certain time periods would remain unmitigated or partially mitigated.

Roosevelt Avenue and 114th Street

No significant adverse pedestrian impacts were identified at this intersection. The recommended signal timing modifications as part of the traffic mitigation would not alter the conclusions made for the pedestrian impact analyses, nor would they result in the potential for any additional significant adverse pedestrian impacts.

New Willetts Point Boulevard and 126th Street

No significant adverse pedestrian or traffic impacts were identified at this intersection; therefore, no mitigation measures are needed. ~~A significant adverse pedestrian impact was identified for the intersection's south crosswalk, where it would operate at beyond mid-LOS D (18.7 SFP) during the weekday PM peak period. Since no traffic impacts requiring mitigation were identified for this intersection, the significant adverse pedestrian impact could be fully mitigated, under the Base Option, by restriping the width of the south crosswalk from 15.0 feet to 16.0 feet, as summarized in Table 21-40.~~

Table 21-40
2032 Mitigated Condition: Pedestrian Level of Service Analysis
New Willetts Point Boulevard and 126th Street

Mitigation Measures	Analysis Time Period		No Action		With Action		Mitigated	
			SFP	LOS	SFP	LOS	SFP	LOS
Base Option								
South Crosswalk – Widening by 1 foot from 15 feet to 16 feet	WD	PM	--	--	18.7	D	20.1	D
Note: — SFP = square feet per pedestrian; WD = weekday; WE = weekend.								

37th Avenue and 126th Street

No significant adverse pedestrian impacts were identified at this intersection; therefore, no mitigation measures are needed. The recommended traffic mitigation would not alter the conclusions made for the pedestrian impact analyses, nor would they result in the potential for any additional significant adverse pedestrian impacts.

36th Avenue and 126th Street

No significant adverse pedestrian impacts were identified at this intersection; therefore, no mitigation measures are needed. The recommended traffic mitigation would not alter the conclusions made for the pedestrian impact analyses, nor would they result in the potential for any additional significant adverse pedestrian impacts.

Roosevelt Avenue and Lot B Driveway

Significant adverse pedestrian impacts were identified for the north crosswalk, where it would operate at LOS E (45.0 14.8 SFP), LOS E (43.6 13.3 SFP), LOS E-F (8.4 7.9 SFP), LOS D (45.8 15.3 SFP), LOS E (42.4 11.7 SFP), LOS D (46.0 15.5 SFP), and LOS D (48.3 17.7 SFP) during the weekday AM, weekday midday, weekday PM, weekday pre-game, weekend midday non-game, weekend pre-game, and weekend post-game peak periods, respectively. Since no traffic impacts requiring mitigation were identified for this intersection, the significant adverse pedestrian impacts could be fully mitigated, under the Base Option, by restriping the width of the north crosswalk from 12.5 feet to ~~24.5~~ 25.0 feet, as summarized in **Table 21-41**. Due to the very low projected vehicular activity at the Lot B Driveway during all time periods, the north crosswalk would operate at most times as an extension of the connecting sidewalks with perpetual walk for the majority of the time. Consequently, it is unlikely that the projected significant adverse impacts on the north crosswalk would occur and a lesser widening (i.e., from 12.5 feet to 20.0 feet) would be expected to adequately serve the future pedestrian flow at this location.

F. AIR QUALITY

EFFECTS OF PROPOSED TRAFFIC MITIGATION MEASURES

Chapter 15, “Air Quality,” concludes that the proposed project would not result in significant adverse impacts on air quality. Therefore, no air quality mitigation is required. Since the proposed traffic mitigation measures described above would alter traffic conditions when compared with the proposed project, the localized air quality impacts with mitigation were modeled for each of the analysis sites described in Chapter 15, “Air Quality.”

Table 21-42 shows the future maximum predicted 8-hour average CO concentration without the proposed project (No Action), as well as with the proposed project with and without the implementation of the traffic mitigation measures (With Action and With Traffic Mitigation) in

Table 21-42
Phase 1A (2018)

8-Hour Average CO Concentrations with Traffic Mitigation

Analysis Site	Location	Time Period	8-Hour Average Concentration (ppm)				
			No Action	With Action	With Traffic Mitigation	Increment with Traffic Mitigation	De Minimis with Traffic Mitigation
2	Boat Basin Road and Shea Road	Weekend non-game day	2.1	2.3	2.3	0.2	3.5
2	Boat Basin Road and Shea Road	Weekend game day	2.3	2.4	2.4	0.1	3.4

Notes: 8-hour standard (NAAQS) is 9 ppm.
Increment with Traffic Mitigation = With Traffic Mitigation – No Action

Phase 1A. Improvements to the traffic mitigation measures at intersection analyzed for Phase 2 (Site 1) were developed between DSEIS and FEIS. The mobile source analysis of CO concentrations at Site 1 reflects changes to traffic mitigation since DSEIS certification. **Table 21-43** shows the effects of traffic mitigation measures on air quality for Phase 2. The results indicate that the proposed project with the traffic mitigation measures would not result in any violations of the 8-hour CO standard (9 ppm) as the 8-hour average concentrations with traffic mitigation (2.3 ppm for the weekend non-game day peak period, and 2.4 ppm for the weekend game day per period in Phase 1A; 2.5 ppm for the weekend non-game day peak period and ~~2.6~~ 2.4 ppm for the game day peak period in Phase 2) would be less than the standard. In addition, the incremental increases in 8-hour average CO concentrations are very small (a maximum of 0.2 ppm for Phase 1A, and a maximum of 0.4 for Phase 2), and consequently would not result in a violation of the CEQR *de minimis* CO criteria, calculated to be 3.5 ppm for the weekend non-game day peak period, and 3.4 ppm for the weekend game day peak period, per the *CEQR Technical Manual* guidance.

Table 21-43
Phase 2 (2032)

8-Hour Average CO Concentrations with Traffic Mitigation

Analysis Site	Location	Time Period	8-Hour Average Concentration (ppm)				
			No Action	With Action	With Traffic Mitigation	Increment with Traffic Mitigation	De Minimis with Traffic Mitigation
1	34th Avenue and 126th Street	Weekend non-game day	2.1	2.6	2.5	0.4	3.5
1	34th Avenue and 126th Street	Weekend game day	2.2	2.6	2.6 <u>2.4</u>	0.4	3.4

Notes: 8-hour standard (NAAQS) is 9 ppm.
Increment with Traffic Mitigation = With Traffic Mitigation – No Action

Table 21-44 shows the Phase 1A (2018) maximum predicted 24-hour average PM₁₀ concentrations without the proposed project, with the proposed project, and with the proposed project and implementation of the traffic mitigation measures (No Action, With Action, With Traffic Mitigation).

Table 21-44
Phase 1A (2018)
24-Hour Average PM₁₀ Concentrations with Traffic Mitigation

Analysis Site	Location	Time Period	24-Hour Concentration (µg/m ³) ¹		
			No Action	With Action	With Traffic Mitigation
2	Boat Basin Road and Shea Road	Weekend non-game day	57.8	65.2	65.2
2	Boat Basin Road and Shea Road	Weekend game day	65.9	66.4	66.4

Note: ¹ NAAQS—24-hour average 150 µg/m³.

As mentioned previously, improvements to the traffic mitigation measures at intersection analyzed for Phase 2 (Site 1) were developed between DSEIS and FSEIS. The mobile source analysis of particulate matter concentrations at Analysis Site 1 reflects changes to traffic mitigation since DSEIS certification, as well as the refined analysis methodology using traffic data from the CORSIM model, as discussed in Chapter 15.

Table 21-45 shows the Phase 2 (2032) maximum predicted 24-hour average PM₁₀ concentrations. The results indicate that the implementation of the traffic mitigation measures for the proposed project would not result in any violations of the PM₁₀ standard at any of the receptor locations analyzed.

Table 21-45
Phase 2 (2032)
24-Hour Average PM₁₀ Concentrations with Traffic Mitigation

Analysis Site	Location	Time Period	24-Hour Concentration (µg/m ³) ¹		
			No Action	With Action	With Traffic Mitigation
1	34th Avenue and 126th Street	Weekend non-game day	69.3	70.1	69.3 62.6
4	34th Avenue and 126th Street	Weekend game day	62.2	70.6	70.0

Note: ¹ NAAQS—24-hour average 150 µg/m³.

Future maximum predicted 24-hour and annual average PM_{2.5} concentrations were determined so that they could be compared with the ~~interim guidance~~ *de minimis* criteria for PM_{2.5}. Consistent with current CEQR guidance, PM_{2.5} concentrations are presented as an incremental change in concentrations for both the proposed project without traffic mitigation measures (as compared with the No Action) and for the proposed project with traffic mitigation measures (as compared with the No Action). The maximum predicted localized 24-hour average and neighborhood-scale annual average PM_{2.5} concentration increments are presented in **Tables 21-46** and **21-47**, respectively, for Phase 1A, and in **Tables 21-48** and **21-49**, respectively, for Phase 2. The results show that the maximum daily (24-hour) PM_{2.5} increments with traffic mitigation measures (**Table 21-46** for Phase 1A and **Table 21-48** for Phase 2) are predicted to be below the *de minimis* ~~applicable interim guidance criterion~~ of 4.5 µg/m³, and the maximum annual average PM_{2.5} increments (**Table 21-47** for Phase 1A and **Table 21-49** for Phase 2) are not predicted to exceed the applicable ~~interim guidance~~ *de minimis* criterion of 0.1 µg/m³. Furthermore, implementation of the traffic mitigation measures would lower the predicted ~~neighborhood-scale annual~~ 24-hour average PM_{2.5} concentration increment from the proposed project.

Table 21-46
Phase 1A (2018)

24-Hour Average PM_{2.5} Concentration Increments with Traffic Mitigation

Analysis Site	Location	Time Period	Increment (µg/m ³)	Increment with Traffic Mitigation (µg/m ³)	<i>De Minimis</i>
2	Boat Basin Road and Shea Road	Weekend non-game day	2.31	2.32	<u>4.5</u>
2	Boat Basin Road and Shea Road	Weekend game day	0.93	0.90	<u>4.5</u>
Notes: EPA has lowered the NAAQS to 35 µg/m ³ , effective December 18, 2006. <u>The PM_{2.5} <i>de minimis</i> criteria superseded the PM_{2.5} interim guidance criteria on June 5, 2013. The 24-hour average, interim guidance criteria for PM_{2.5} were as follows — > 2 µg/m³ (5 µg/m³ not-to-exceed value), based on the magnitude, frequency duration, location, and size of the area of the predicted concentrations.</u> <u>The PM_{2.5} increments shown are less than the <i>de minimis</i> value. These increments were not considered significant when they were compared with the interim guidance criteria in the DSEIS, and are also not significant when compared to the <i>de minimis</i> value.</u>

Notes: EPA has lowered the NAAQS to 12 µg/m ³ , effective March 2013. PM _{2.5} interim guidance <i>de minimis</i> criteria—annual average (neighborhood scale) 0.1 µg/m ³ . <u>The <i>de minimis</i> criteria superseded the interim guidance criteria that were used for impact assessment in the DSEIS. For annual increments, the <i>de minimis</i> criteria are the same as the superseded interim guidance criteria.</u>			

Table 21-48
Phase 2 (2032)

24-Hour Average PM_{2.5} Concentration Increments with Traffic Mitigation

Analysis Site	Location	Time Period	Increment (µg/m ³)	Increment with Traffic Mitigation (µg/m ³)	<i>De Minimis</i>
1	34th Avenue and 126th Street	Weekend non-game day	3.50 <u>1.28</u>	3.24 <u>1.05</u>	<u>4.5</u>
4	34th Avenue and 126th Street	Weekend game day	4.70	4.83	<u>4.5</u>
Notes: EPA has lowered the NAAQS to 35 µg/m ³ , effective December 18, 2006. <u>The PM_{2.5} <i>de minimis</i> criteria superseded the PM_{2.5} interim guidance criteria on June 5, 2013. The 24-hour average, interim guidance criteria for PM_{2.5} were as follows — > 2 µg/m³ (5 µg/m³ not-to-exceed value), based on the magnitude, frequency duration, location, and size of the area of the predicted concentrations.</u> <u>The PM_{2.5} increments shown are less than the <i>de minimis</i> value. These increments were not considered significant when they were compared with the interim guidance criteria in the DSEIS, and are also not significant when compared to the <i>de minimis</i> value.</u>					

Table 21-49

Phase 2 (2032) with Traffic Mitigation
Neighborhood Scale PM_{2.5} Concentration Increments in µg/m³

Analysis Site	Location	Increment	Increment with Traffic Mitigation	<i>De Minimis</i>
1	34th Avenue and 126th Street	0.10 <u>0.08</u>	0.06 <u>0.10</u>	<u>0.1</u>
Notes: EPA has lowered the NAAQS to 12 µg/m ³ , effective March 2013. PM _{2.5} interim guidance <i>de minimis</i> criteria—annual average (neighborhood scale) 0.1 µg/m ³ . <i>The de minimis criteria superseded the interim guidance criteria that were used for impact assessment in the DSEIS. For annual increments, the de minimis criteria are the same as the superseded interim guidance criteria.</i>				

For Phase 1A, the maximum 24-hour average incremental PM_{2.5} concentration from the proposed project with the traffic mitigation measures was predicted to be 2.32 µg/m³ (shown in **Table 21-46**) at Site 2, for the non-game analysis period, slightly above the incremental concentration predicted without the mitigation measures. ~~Throughout the five analysis years, 24-hour average PM_{2.5} concentration increments above 2.0 µg/m³ were predicted to occur four times, and at most once per year. Based on the magnitude, extent, and frequency of 24 hour average PM_{2.5} concentrations above 2.0 µg/m³, the proposed project with traffic mitigation would not result in significant PM_{2.5} impacts at the analyzed receptor location in Phase 1A. Furthermore, the maximum predicted 24 hour average concentration for Phase 1A with traffic mitigation is 4.52 µg/m³, which when added to the PM_{2.5} background concentration of 26 µg/m³ would be less than the corresponding NAAQS of 35 µg/m³.~~

Additional air quality studies were undertaken between the DSEIS and FSEIS to account for improvements to the traffic mitigation measures that were developed for Analysis Site 1 after DSEIS certification. The refined analysis, using traffic data from the CORSIM model was conducted for the non-game analysis period, which resulted in greatest concentrations at sensitive receptors without the refined modeling. For Phase 2, the maximum 24-hour average incremental PM_{2.5} concentration from the proposed project with the traffic mitigation measures was predicted to be ~~3.24~~ 1.05 µg/m³ (shown in **Table 21-48**) at Site 1, for the non-game analysis period, which is less than the incremental concentration predicted without the mitigation measures. ~~Assuming non-game day conditions throughout the five analysis years, 24 hour average PM_{2.5} concentration increments above 2.0 µg/m³ were predicted to occur for at most two times in a year, and at an average of 1.2 times per year, much less frequently than without the traffic mitigation measures. With traffic mitigation, over the five year period, there would be only two occurrences of 24 hour average PM_{2.5} concentration increments above 3.0 µg/m³, occurring at most once per year and at an average of 0.4 times per year. Based on the magnitude, extent, and frequency of 24 hour average PM_{2.5} concentrations above 2.0 µg/m³, the proposed project with traffic mitigation measures would not result in significant PM_{2.5} impacts at the analyzed receptor locations. Furthermore, the maximum predicted 24 hour average concentration for Phase 2 with traffic mitigation is 6.36 µg/m³, which when added to the PM_{2.5} background concentration of 26 µg/m³ would be less than the corresponding NAAQS of 35 µg/m³. Therefore, no significant adverse air quality impacts would occur as a result of the proposed traffic mitigation measures. Additional air quality studies may be undertaken between the Draft SEIS and Final SEIS to further refine mitigation mobile source analysis for the Phase 2 analysis year, in consultation with DEP.~~

G. NOISE

Future noise levels with the proposed traffic mitigation measures were calculated for a residential receptor along Janet Place using the methodology described in Chapter 17, “Noise,” for 2018, 2028, and 2032 analysis years. This receptor was analyzed, as traffic traveling southbound on College Point Boulevard and turning right on Roosevelt Avenue would be diverted onto 39th Avenue and Janet Place before turning onto Roosevelt Avenue, and traffic traveling west on Roosevelt Avenue and turning left on College Point Boulevard would be diverted north on Janet Place and east on 39th Avenue before making a right onto College Point Boulevard. A proportional model was used to determine that the proposed traffic mitigation measures would not have the potential to increase noise levels at other noise-sensitive receptor locations. A weekday AM peak hour measurement was conducted on February 7, 2013. The TNM was used to estimate noise levels during all time periods and to predict future No Action and With Action values and to assess any potential impacts. No Action and With Action (With Mitigation) values for 2018, 2028, and 2032 analysis years with the proposed traffic mitigation measures in place are shown in **Tables 21-50, 21-51, and 21-52.**

Table 21-50
2018 Noise Levels With Traffic Mitigation Measures

Location	Day	Time Period	No Action L _{eq} (1)	With Mitigation L _{eq} (1)	Mitigation— No Action Increase
Janet Place between 39th and Roosevelt Avenues	Weekday	AM	67.7 68.0	67.7 68.5	0.0 0.5
	Weekday	MD	67.6	67.7 68.1	0.0 0.5
	Weekday	PM	67.7 67.8	67.8 68.1	0.0 0.3

	Saturday	Pre-Game	67.5	<u>67.6</u> 67.9	<u>0.1</u> 0.5
	Saturday	Post-Game	67.5	<u>67.6</u> 67.9	<u>0.1</u> 0.5

Table 21-52
2032 Noise Levels With Traffic Mitigation Measures

Location	Day	Time Period	No Action $L_{eq(1)}$	With Mitigation $L_{eq(1)}$	Mitigation— No Action Increase
Janet Place between 39th and Roosevelt Avenues	Weekday	AM	<u>67.7</u> 68.1	<u>67.9</u> 68.7	<u>0.2</u> 0.6
	Weekday	MD	67.6	<u>67.9</u> 68.2	<u>0.3</u> 0.5
	Weekday	PM	<u>67.7</u> 67.8	<u>67.9</u> 68.2	<u>0.2</u> 0.5
	Saturday	MD	67.5	<u>67.7</u> 68.0	<u>0.2</u> 0.5
	Weekday	Pre-Game	67.4	<u>67.6</u> 68.0	<u>0.2</u> 0.6
	Saturday	Pre-Game	67.5	<u>67.7</u> 67.9	<u>0.2</u> 0.5
	Saturday	Post-Game	67.5	<u>67.6</u> 68.0	<u>0.1</u> 0.5

In 2032, when the proposed project would be completed, $L_{eq(1)}$ noise levels due to project-generated traffic with the proposed traffic mitigation measures would be less than 1 dBA. Noise level increases of this magnitude would be imperceptible and would not result in any significant adverse noise impacts due to the traffic mitigation measures noise.

H. CONSTRUCTION

There would be temporary inconvenience and disruption arising from the construction of the proposed project throughout the Willets Point/CitiField area. As explained in detail in Chapter 20, "Construction," the proposed project would result in significant adverse construction impacts related to transportation and historic and cultural resources. Potential mitigation for these significant adverse impacts is described below.

HISTORIC AND CULTURAL RESOURCES

As described above, in Section C. “Historic and Cultural Resources,” consistent with the findings in the 2008 FGEIS, construction activities related to the development that would occur within the District during Phase 2 of the proposed project would be anticipated to result in the demolition of the former Empire Millwork Corporation Building, which was found by OPRHP to be eligible for listing on the State and National Registers of Historic Places (S/NR). Demolition of this structure would be considered a significant adverse effect on this architectural resource. Potential measures to mitigate this adverse impact are described in Section C above.

TRAFFIC

As detailed in Chapter 20, “Construction,” the worst-case analysis of peak Phase 2 construction identified significant adverse traffic impacts during the 6–7 AM and 3–4 PM construction peak hours. All significantly impacted intersections could be fully or partially mitigated, the majority of which would require standard mitigation measures typically implemented by NYCDOT. In addition, two locations—126th Street at Northern Boulevard and 126th Street/Grand Central Parkway Ramp at 34th Avenue—would require special more intensive mitigation measures to mitigate the significant impacts in the 3–4 PM peak construction hour. The recommended mitigation measures would be similar to those proposed to mitigate the intersection impacts associated with the project’s build-out and occupancy. In addition, the significant adverse traffic impacts disclosed for the 2032 With Action condition may also occur during peak construction in 2031. Similar mitigation measures as those identified for the 2032 With Action condition are expected to also address the potential traffic impacts during construction. As with the 2032 With Action condition, several of the projected traffic impacts during various analysis peak periods may remain unmitigated.

TRANSIT

The construction worker trips would occur outside of peak periods of transit ridership and would be distributed and dispersed to the nearby transit facilities, and would not result in any significant adverse transit impacts. However, the significant adverse transit impacts disclosed for the 2032 With Action condition may also occur during peak construction in 2031. Similar mitigation measures as those identified for the 2032 With Action condition (i.e., stairway widening at the Mets-Willets Point subway station and bus frequency increase) are expected to also address the potential transit impacts during construction. As with the 2028 and 2032 With Action conditions, the projected subway ~~station and~~ line-haul impacts may remain unmitigated.

PEDESTRIANS

The construction worker pedestrian trips would primarily be concentrated during off-peak hours (6–7 AM and 3–4 PM) and would be distributed among numerous pedestrian facilities (i.e. sidewalks, corner reservoirs, and crosswalks) in the area. Accordingly, there would not be a potential for significant adverse pedestrian impacts attributable to the projected construction worker pedestrian trips. However, the significant adverse pedestrian impacts disclosed for the 2032 With Action condition may also occur during peak construction in 2031. Similar mitigation measures as those identified for the 2032 With Action condition (i.e., crosswalk widening) are expected to also address the potential pedestrian impacts during construction. Where mitigation measures may be deemed impractical to mitigate the projected With Action significant adverse pedestrian impacts, those impacts could similarly be unmitigatable during construction.

Detailed Intersection Level of Service Tables

TABLE 1
2018 (PHASE 1A) SUMMARY OF NON-GAMEDAY MITIGATION MEASURES

INTERSECTION SIGNALIZED INTERSECTIONS	NON-GAMEDAY WEEKDAY AM PEAK HOUR	NON-GAMEDAY WEEKDAY MIDDAY PEAK HOUR	NON-GAMEDAY WEEKDAY PM PEAK HOUR	NON-GAMEDAY SATURDAY MIDDAY PEAK HOUR
108th Street at Astoria Boulevard	Mitigation not required. Install "No Standing Anytime" regulations along the east curb of the NB approach for 250 ft from the intersection to allow for two moving lanes. Install "No Standing Anytime" regulations along the west curb of the SB approach for 250 ft from the intersection to allow for two moving lanes. Restrict NB approach of 108th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restrict SB approach of 108th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft.	Mitigation not required. Install "No Standing Anytime" regulations along the east curb of the NB approach for 250 ft from the intersection to allow for two moving lanes. Install "No Standing Anytime" regulations along the west curb of the SB approach for 250 ft from the intersection to allow for two moving lanes. Restrict NB approach of 108th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restrict SB approach of 108th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Modify signal timing: shift 2 of green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 66 s to 68 s; NB/SB green time shifts from 30 s to 28 s].	Unmitigatable impact. Install "No Standing Anytime" regulations along the east curb of the NB approach for 250-ft from the intersection to allow for two moving lanes. Install "No Standing Anytime" regulations along the west curb of the SB approach for 250-ft from the intersection to allow for two moving lanes. Restrict NB approach of 108th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restrict SB approach of 108th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Modify signal timing: shift 2 green time from EB/WB phase to EB/WB phase; shift 1 s green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 71 s to 74 s; EB/WB left-turn phase shifts from 9 s to 7 s; NB/SB phase shifts from 25 s to 24 s].	Mitigation not required. Install "No Standing Anytime" regulations along the east curb of the NB approach for 250 ft from the intersection to allow for two moving lanes. Install "No Standing Anytime" regulations along the west curb of the SB approach for 250-ft from the intersection to allow for two moving lanes. Restrict NB approach of 108th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restrict SB approach of 108th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Modify signal timing: shift 4 green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 66 s to 70 s; NB/SB phase shifts from 30 s to 26 s].
114th Street at Northern Boulevard (RT, 25A)	Prohibit left-turns from WB Northern Boulevard onto SB 114th Street to allow for three exclusive through lanes. Divert left-turning turning to NB 112th Street and then to SEB 114th Street. Prohibit parking along east curb of SB 114th Street for 200 ft and restripe as two 11-ft moving lanes. Restrict SB 114th Street receiving lanes as two 11-ft moving lanes with parking on both sides. Modify signal timing: Eliminate WB lead phase. Shift 7 s green time from WB lead phase to SB phase [SB green time shifts from 23 to 30 s]. Shift 34 s green time from WB lead phase to EB/WB phase [EB/WB green time shifts from 46 to 38 s].	Prohibit left-turns from WB Northern Boulevard onto SB 114th Street to allow for three exclusive through lanes. Divert left-turning turning to NB 112th Street and then to SEB 114th Street. Prohibit parking along east curb of SB 114th Street for 200 ft and restripe as two 11-ft moving lanes. Restrict SB 114th Street receiving lanes as two 11-ft moving lanes with parking on both sides. Modify signal timing: Eliminate WB lead phase. Shift 10 s green time from WB lead phase to SB phase [SB green time shifts from 25 to 35 s]. Shift 12 s green time from WB lead phase to EB/WB phase [EB/WB green time shifts from 63 to 75 s]. [Measures reflect improvements needed for the Weekday Non-game AM and PM, Saturday, Weekday Pre-game, and Saturday Pre- and Post-game peak periods.]	Prohibit left-turns from WB Northern Boulevard onto SB 114th Street to allow for three exclusive through lanes. Divert left-turning turning to NB 112th Street and then to SEB 114th Street. Prohibit parking along east curb of SB 114th Street for 200 ft and restripe as two 11-ft moving lanes. Restrict SB 114th Street receiving lanes as two 11-ft moving lanes with parking on both sides. Modify signal timing: Eliminate WB lead phase. Shift 12 s green time from WB lead phase to SB phase [SB green time shifts from 25 to 35 s]. Shift 10 s green time from WB lead phase to EB/WB phase [EB/WB green time shifts from 65 to 75 s].	Prohibit left-turns from WB Northern Boulevard onto SB 114th Street to allow for three exclusive through lanes. Divert left-turning turning to NB 112th Street and then to SEB 114th Street. Prohibit parking along east curb of SB 114th Street for 200 ft and restripe as two 11-ft moving lanes. Restrict SB 114th Street receiving lanes as two 11-ft moving lanes with parking on both sides. Modify signal timing: Eliminate WB lead phase. Shift 10 s green time from WB lead phase to SB phase [SB green time shifts from 25 to 35 s]. Shift 12 s green time from WB lead phase to EB/WB phase [EB/WB green time shifts from 63 to 75 s]. [Measures reflect improvements needed for the Weekday Non-game AM and PM, Saturday, Weekday Pre-game, and Saturday Pre- and Post-game peak periods.]
126th Street at Northern Boulevard (RT, 25A)	Install Jersey barriers on WB approach between the right-most lane and center lane to allow the Van Wyk and Whitestone Expressway Ramp to bypass the signal and operate as free flow through the intersection. Close the ramp from EB Northern Blvd ramp to 126th Street. Divert traffic from the closed ramp through the intersection to SB 126th P to 34th Ave. Widen the EB Northern approach from two 12-ft lanes to three 10-ft lanes. Prohibit pedestrian crossing in the east crosswalk and divert pedestrians to the new crossing at 126th Place at Northern Boulevard. Restrict NB approach of 126th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restrict SB approach of 126th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Modify signal timing: shift 1 s of green time from EB GCP/Astoria Blvd ramp phase to EB Northern Blvd phase and shift 1 s of green time from EB GCP/Astoria Blvd ramp phase to NB 126th St phase [EB Northern Blvd green time shifts from 55 s to 57 s; EB GCP/Astoria Blvd ramp green time shifts from 45 s to 42 s; NB 126th St green time shifts from 25 s to 26 s].	Install Jersey barriers on WB approach between the right-most lane and center lane to allow the Van Wyk and Whitestone Expressway Ramp to bypass the signal and operate as free flow through the intersection. Close the ramp from EB Northern Blvd ramp to 126th Street. Divert traffic from the closed ramp through the intersection to SB 126th P to 34th Ave. Widen the EB Northern approach from two 12-ft lanes to three 10-ft lanes. Prohibit pedestrian crossing in the east crosswalk and divert pedestrians to the new crossing at 126th Place at Northern Boulevard. Restrict NB approach of 126th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restrict SB approach of 126th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Modify signal timing: shift 1 s of green time from EB GCP/Astoria Blvd ramp phase to EB Northern Blvd phase and shift 1 s of green time from EB GCP/Astoria Blvd ramp phase to NB 126th St phase [EB Northern Blvd green time shifts from 55 s to 57 s; EB GCP/Astoria Blvd ramp green time shifts from 45 s to 42 s; NB 126th St green time shifts from 25 s to 26 s].	Install Jersey barriers on WB approach between the right-most lane and center lane to allow the Van Wyk and Whitestone Expressway Ramp to bypass the signal and operate as free flow through the intersection. Close the ramp from EB Northern Blvd ramp to 126th Street. Divert traffic from the closed ramp through the intersection to SB 126th P to 34th Ave. Widen the EB Northern approach from two 12-ft lanes to three 10-ft lanes. Prohibit pedestrian crossing in the east crosswalk and divert pedestrians to the new crossing at 126th Place at Northern Boulevard. Restrict NB approach of 126th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restrict SB approach of 126th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Modify signal timing: shift 1 s of green time from EB GCP/Astoria Blvd ramp phase to EB Northern Blvd phase and shift 1 s of green time from EB GCP/Astoria Blvd ramp phase to NB 126th St phase [EB Northern Blvd green time shifts from 55 s to 57 s; EB GCP/Astoria Blvd ramp green time shifts from 45 s to 42 s; NB 126th St green time shifts from 25 s to 26 s].	Install Jersey barriers on WB approach between the right-most lane and center lane to allow the Van Wyk and Whitestone Expressway Ramp to bypass the signal and operate as free flow through the intersection. Close the ramp from EB Northern Blvd ramp to 126th Street. Divert traffic from the closed ramp through the intersection to SB 126th P to 34th Ave. Widen the EB Northern approach from two 12-ft lanes to three 10-ft lanes. Prohibit pedestrian crossing in the east crosswalk and divert pedestrians to the new crossing at 126th Place at Northern Boulevard. Restrict NB approach of 126th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restrict SB approach of 126th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Modify signal timing: shift 1 s of green time from EB GCP/Astoria Blvd ramp phase to EB Northern Blvd phase and shift 1 s of green time from EB GCP/Astoria Blvd ramp phase to NB 126th St phase [EB Northern Blvd green time shifts from 55 s to 57 s; EB GCP/Astoria Blvd ramp green time shifts from 45 s to 44 s].
Prince Street at Northern Boulevard (RT, 25A) Main Street at Northern Boulevard (RT, 25A)	Unmitigatable impact. Mitigation not required. Install "No Standing 7AM - 10PM" regulations along the north curb of the WB Northern Blvd approach 200 ft from the intersection to allow for one 10-ft daylighted shared through-right lane. Modify Signal Timing: Shift 2 s of green time from NB/SB phase to EB/WB phase [NB/SB green time shifts from 44 s to 42 s; EB/WB green time shifts from 45 s to 47 s].	Unmitigatable impact. Mitigation not required. Install "No Standing 7AM - 10PM" regulations along the north curb of the WB Northern Blvd approach 200 ft from the intersection to allow for one 10-ft daylighted shared through-right lane. Modify Signal Timing: Shift 2 s of green time from NB/SB phase to EB/WB phase [NB/SB green time shifts from 44 s to 42 s; EB/WB green time shifts from 45 s to 47 s].	Unmitigatable impact. Mitigation not required. Install "No Standing 7AM - 10PM" regulations along the north curb of the WB Northern Blvd approach 200 ft from the intersection to allow for one 10-ft daylighted shared through-right lane. Modify Signal Timing: Shift 2 s of green time from NB/SB phase to EB/WB phase [NB/SB green time shifts from 44 s to 42 s; EB/WB green time shifts from 45 s to 47 s].	Unmitigatable impact. Mitigation not required. Install "No Standing 7AM - 10PM" regulations along the north curb of the WB Northern Blvd approach 200 ft from the intersection to allow for one 10-ft daylighted shared through-right lane. Modify Signal Timing: Shift 3 s of green time from NB/SB phase to EB/WB phase [NB/SB green time shifts from 44 s to 41 s; EB/WB green time shifts from 45 s to 48 s].
Union Street at Northern Boulevard (RT, 25A)	Unmitigatable impact. Mitigation not required. Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 1 s of green time from EB/WB protected left-turn phase to EB/WB phase [EB/WB green time shifts from 50 s to 51 s; EB/WB protected left-turn green time shifts from 12 s to 11 s].	Unmitigatable impact. Mitigation not required. Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 1 s of green time from EB/WB protected left-turn phase to NB/SB phase and 2 s green time from EB/WB protected left-turn phase to EB/WB phase [NB/SB green time shifts from 50 s to 52 s].	Unmitigatable impact. Mitigation not required. Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 1 s of green time from EB/WB protected left-turn phase to NB/SB phase and 2 s green time from EB/WB protected left-turn phase to EB/WB phase [NB/SB green time shifts from 50 s to 52 s].	Unmitigatable impact. Mitigation not required. Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 4 s of green time from EB/WB phase to NB/SB phase [EB/WB green time shifts from 50 s to 54 s].
Parsons Boulevard at Northern Boulevard (RT, 25A)	Unmitigatable impact. Mitigation not required. Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 1 s of green time from EB/WB protected left-turn phase to EB/WB phase [EB/WB green time shifts from 50 s to 51 s; EB/WB protected left-turn green time shifts from 12 s to 11 s].	Unmitigatable impact. Mitigation not required. Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 3 s of green time from EB phase to SB phase [EB green time shifts from 52 s to 49 s; SB green time shifts from 28 s to 31 s].	Unmitigatable impact. Mitigation not required. Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 3 s of green time from EB phase to SB phase [EB green time shifts from 52 s to 49 s; SB green time shifts from 28 s to 31 s].	Unmitigatable impact. Mitigation not required. Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 4 s of green time from EB/WB phase to NB/SB phase [EB/WB green time shifts from 50 s to 54 s].
126th Street/GCP Ramp at 34th Avenue	Mitigation not required. Restrict the NB 126th Street approach from two 11-ft travel lanes, one 12-ft travel lane, and one 7-ft hatched median to one 12-ft exclusive left-turn lane, two 12-ft travel lanes and one 5-ft Class II bicycle lane. Widen roadway on the east leg of the intersection to 44 ft to have two 11-ft WB approach lanes and two 11-ft EB receiving lanes. Close the ramp from EB Northern Blvd ramp to 126th Street. Construct a channelized right-turn lane from the GCP/EB Astoria Blvd ramp to WB Shea Road. Reconstruct the GCP/EB Astoria Blvd ramp to have one 11-ft exclusive left-turn lane and two 11-ft travel lanes. Modify signal phasing and timing plan: EB/WB phase will have 55 s green time; NB/SB phase will have 55 s green time [each phase will have 3 s amber and 2 s all red time].	Modify Signal Timing: Shift 3 s of green time from EB phase to SB phase [EB green time shifts from 52 s to 49 s; SB green time shifts from 28 s to 31 s]. Restrict the NB 126th Street approach from two 11-ft travel lanes, one 12-ft travel lane, and one 7-ft hatched median to one 12-ft exclusive left-turn lane, two 12-ft travel lanes and one 5-ft Class II bicycle lane. Widen roadway on the east leg of the intersection to 44 ft to have two 11-ft WB approach lanes and two 11-ft EB receiving lanes. Close the ramp from EB Northern Blvd ramp to 126th Street. Construct a channelized right-turn lane from the GCP/EB Astoria Blvd ramp to WB Shea Road. Reconstruct the GCP/EB Astoria Blvd ramp to have one 11-ft exclusive left-turn lane and two 11-ft travel lanes. Modify signal phasing and timing plan: EB/WB phase will have 55 s green time; NB/SB phase will have 55 s green time [each phase will have 3 s amber and 2 s all red time].	Modify Signal Timing: Shift 3 s of green time from EB phase to SB phase [EB green time shifts from 52 s to 49 s; SB green time shifts from 28 s to 31 s]. Restrict the NB 126th Street approach from two 11-ft travel lanes, one 12-ft travel lane, and one 7-ft hatched median to one 12-ft exclusive left-turn lane, two 12-ft travel lanes and one 5-ft Class II bicycle lane. Widen roadway on the east leg of the intersection to 44 ft to have two 11-ft WB approach lanes and two 11-ft EB receiving lanes. Close the ramp from EB Northern Blvd ramp to 126th Street. Construct a channelized right-turn lane from the GCP/EB Astoria Blvd ramp to WB Shea Road. Reconstruct the GCP/EB Astoria Blvd ramp to have one 11-ft exclusive left-turn lane and two 11-ft travel lanes. Modify signal phasing and timing plan: EB/WB phase will have 55 s green time; NB/SB phase will have 55 s green time [each phase will have 3 s amber and 2 s all red time].	Restrict the NB 126th Street approach from two 11-ft travel lanes, one 12-ft travel lane, and one 7-ft hatched median to one 12-ft exclusive left-turn lane, two 12-ft travel lanes and one 5-ft Class II bicycle lane. Widen roadway on the east leg of the intersection to 44 ft to have two 11-ft WB approach lanes and two 11-ft EB receiving lanes. Close the ramp from EB Northern Blvd ramp to 126th Street. Construct a channelized right-turn lane from the GCP/EB Astoria Blvd ramp to WB Shea Road. Reconstruct the GCP/EB Astoria Blvd ramp to have one 11-ft exclusive left-turn lane and two 11-ft travel lanes. Modify signal phasing and timing plan: EB/WB phase will have 55 s green time; NB/SB phase will have 55 s green time [each phase will have 3 s amber and 2 s all red time].
108th Street at Roosevelt Avenue	Install "No Standing Anytime" regulations along the east curb of the NB 108th Street approach 150-ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB 108th Street approach 150-ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane. [Measures reflect improvements needed for the Weekday Non-game Midday, Weekday Non-game PM and Saturday Non-game Midday peak periods.]	Install "No Standing Anytime" regulations along the east curb of the NB 108th Street approach 150-ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB 108th Street approach 150-ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane.	Install "No Standing Anytime" regulations along the east curb of the NB 108th Street approach 150 ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB 108th Street approach 150 ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane.	Install "No Standing Anytime" regulations along the east curb of the NB 108th Street approach 150 ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB 108th Street approach 150 ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane.
111th Street at Roosevelt Avenue	Mitigation not required.	Install "No Standing 10 AM - 10 PM" regulations along the north curb of the WB Roosevelt Avenue approach 100-ft from the intersection to allow for one 11-ft left-through lane and one 10-ft right-turn lane. [Measures reflect improvements needed for the Weekday Non-game PM, Saturday Non-game Midday, Weekday Pre-game, and Saturday Pre- and Post-game peak periods.]	Install "No Standing 10 AM - 10 PM" regulations along the north curb of the WB Roosevelt Avenue approach 100-ft from the intersection to allow for one 11-ft left-through lane and one 10-ft right-turn lane.	Install "No Standing 10 AM - 10 PM" regulations along the north curb of the WB Roosevelt Avenue approach 100-ft from the intersection to allow for one 11-ft left-through lane and one 10-ft right-turn lane.
114th Street at Roosevelt Avenue	Partially mitigated. Shift the centerline of the SB 114th Street approach 2 feet to the east. Install "No Standing Anytime" regulations along the west curb of the SB 114th Street approach 150-ft from the stop bar to allow for one 12-ft shared left-through lane and one 10-ft right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Roosevelt Avenue approach 150-ft from the stop bar to allow for one 11-ft left-turn lane and one 11-ft shared through-right lane. Shift center line of WB Roosevelt Avenue approach 11 ft to the south. Restrict WB Roosevelt Avenue approach as one 11-ft left-turn pocket (250 feet long), one 11-ft through lane, and one 11-ft right-turn lane.	Shift the centerline of the SB 114th Street approach 2 feet to the east. Install "No Standing Anytime" regulations along the west curb of the SB 114th Street approach 150-ft from the stop bar to allow for one 12-ft shared left-through lane and one 10-ft right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Roosevelt Avenue approach 150-ft from the stop bar to allow for one 11-ft left-turn lane and one 11-ft shared through-right lane. Shift center line of WB Roosevelt Avenue approach 11 ft to the south. Restrict WB Roosevelt Avenue approach as one 11-ft left-turn pocket (250 feet long), one 11-ft through lane, and one 11-ft right-turn lane.	Shift the centerline of the SB 114th Street approach 2 feet to the east. Install "No Standing Anytime" regulations along the west curb of the SB 114th Street approach 150 ft from the stop bar to allow for one 12-ft shared left-through lane and one 10-ft right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Roosevelt Avenue approach 150-ft from the stop bar to allow for one 11-ft left-turn lane and one 11-ft shared through-right lane. Shift center line of WB Roosevelt Avenue approach 11 ft to the south. Restrict WB Roosevelt Avenue approach as one 11-ft left-turn pocket (250 feet long), one 11-ft through lane, and one 11-ft right-turn lane.	Shift the centerline of the SB 114th Street approach 2 feet to the east. Install "No Standing Anytime" regulations along the west curb of the SB 114th Street approach 150 ft from the stop bar to allow for one 12-ft shared left-through lane and one 10-ft right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Roosevelt Avenue approach 150-ft from the stop bar to allow for one 11-ft left-turn lane and one 11-ft shared through-right lane. Shift center line of WB Roosevelt Avenue approach 11 ft to the south. Restrict WB Roosevelt Avenue approach as one 11-ft left-turn pocket (250 feet long), one 11-ft through lane, and one 11-ft right-turn lane.
126th Street at Roosevelt Avenue	Restrict SB approach as one 12-ft right-turn lane and one 11-ft shared left-through lane. New signal phasing and timing plan: Shared EB/WB phase receives 55 s green time; EB lag phase with SB right-turn receives 7 s green time; NB/SB phase receives 39 s green time [each phase will have 3 s amber and 2 s all red time].	Restrict SB approach as one 12-ft right-turn lane and one 11-ft shared left-through lane. New signal phasing and timing plan: Shared EB/WB phase receives 55 s green time; EB lag phase with SB right-turn receives 7 s green time; NB/SB phase receives 43 s green time [each phase will have 3 s amber and 2 s all red time].	Restrict SB approach as one 12-ft right-turn lane and one 11-ft shared left-through lane. New signal phasing and timing plan: Shared EB/WB phase receives 59 s green time; EB lag phase with SB right-turn receives 7 s green time; NB/SB phase receives 39 s green time [each phase will have 3 s amber and 2 s all red time].	Restrict SB approach as one 12-ft right-turn lane and one 11-ft shared left-through lane. New signal phasing and timing plan: Shared EB/WB phase receives 56 s green time; EB lag phase with SB right-turn receives 7 s green time; NB/SB phase receives 42 s green time [each phase will have 3 s amber and 2 s all red time].

2018 (PHASE 1A) SUMMARY OF NON- GAMEDAY MITIGATION MEASURES

NOTE: This table has been revised for the Final SEIS.

TABLE 2
CITIFIELD - WILLETS POINT DEVELOPMENT STUDY
2018 PHASE 1A WEEKDAY NON-GAME AM NO ACTION VS WITH ACTION TRAFFIC LEVELS OF SERVICE COMPARISON

INTERSECTION & APPROACH		No Action				With Action				Mitigation				Mitigation Measure

NORTHERN BOULEVARD															
108th Street at Northern Boulevard (RT. 25A)															
108th Street	NB	LTR	1.10	100.2	F	LTR	1.20	139.5	F	L	0.55	43.9	D	-Install "No Standing Anytime" regulations along the east curb of the NB approach for 250-ft from the intersection to allow for two moving lanes.	
		-	-	-	-	-	-	-	-	TR	0.60	42.5	D		
Northern Boulevard (Rt. 25A)	SB	LTR	0.96	77.2	E	LTR	0.97	79.0	E	L	0.30	42.6	D	-Install "No Standing Anytime" regulations along the west curb of the SB approach for 250-ft from the intersection to allow for two moving lanes.	
	-	-	-	-	-	-	-	-	-	TR	0.62	47.3	D		
	EB	L	0.07	20.8	C	L	0.07	21.4	C	L	0.07	21.4	C	-Restripe NB approach of 108th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft.	
	TR	0.74	20.3	C	TR	0.77	21.1	C	TR	0.77	21.1	C			
	WB	L	0.42	20.3	C	L	0.44	21.7	C	L	0.44	21.7	C	-Restripe SB approach of 108th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft.	
	TR	1.02	30.5	C	TR	1.03	33.7	C	TR	1.03	33.7	C			
Overall Intersection		-	0.91	34.2	C	-	0.94	39.0	D	-	0.80	31.1	C		
114th Street at Northern Boulevard (RT. 25A)															
114th Street	SB	LTR	0.46	47.5	D	LTR	0.49	48.2	D	LTR	0.61	43.4	D	-Prohibit left-turns from WB Northern Boulevard onto SB 114th Street to allow for three exclusive through lanes.	
	EB	T	0.86	39.9	D	T	0.89	42.1	D	T	0.51	10.8	B		
Northern Boulevard (Rt. 25A)	-	R	0.73	37.7	D	R	0.74	38.4	D	R	0.43	10.3	B	-Divert left-turning turning to NB 112th Street and then to SB 114th Street.	
	WB	DefL	0.48	13.6	B	DefL	0.51	16.6	B	-	-	-	-	-Prohibit parking along east curb of SB 114th Street for 200 ft and restripe as two 11-ft lanes.	
	-	T	1.16	89.8	F	T	1.17	94.4	F	T	0.98	21.6	C	-Restripe SB 114th Street receiving lanes as two 11-ft moving lanes with parking on both sides.	
	Overall Intersection		-	1.30	67.8	E	-	1.32	70.9	E	-	0.88	20.5	C	-Modify signal timing: Eliminate WB lead phase. Shift 7 s green time from WB lead phase to SB phase [SB green time shifts from 23 s to 30 s]. Shift 34 s green time from WB lead phase to EB/WB phase [EB/WB green time shifts from 46 s to 80 s].
126th Street at Northern Boulevard (RT. 25A)															
126th Street	NB	L	0.28	41.1	D	L	0.37	42.6	D	L	0.37	42.6	D	-Install Jersey barriers on WB approach between the right-most lane and center lane to allow the Van Wyck and Whitestone Expressway Ramp to bypass the signal and operate as free flow through the intersection.	
		R	0.27	41.2	D	R	0.63	53.5	D	R	0.39	43.3	D		
Northern Boulevard	EB	T	0.53	38.0	D	T	0.53	38.0	D	T	0.56	37.9	D	-Close the ramp from EB Northern Blvd ramp to 126th Street.	
	WB	T	0.64	10.6	B	T	0.66	10.9	B	T	0.66	10.9	B	-Divert traffic from the closed ramp through the intersection to SB 126th Pl to 34th Ave.	
Grand Central Parkway Ramp	EB	T	0.82	40.9	D	T	0.82	40.9	D	T	0.82	40.9	D	-Widen the EB Northern approach from two 12-ft lanes to three 10-ft lanes.	
Van Wyck & Whitestone Expressway Ramp	WB	T	1.09	101.3	F	T	1.20	144.9	F	-	-	-	-	-Prohibit pedestrian crossing in the east crosswalk and divert pedestrians to the new crossing at 126th Place at Northern Boulevard.	
Overall Intersection		-	0.91	48.5	D	-	1.07	63.2	E	-	0.63	28.2	C

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Overall Intersection		-	-	15.9	C	-	-	16.7	C	-	0.43	9.1	A	

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

TABLE 6

INTERSECTION		2018 (PHASE 1A) SUMMARY OF GAMEDAY MITIGATION MEASURES	
SIGNALIZED INTERSECTIONS	WEEKDAY PRE-GAME PEAK HOUR	SATURDAY PRE-GAME PEAK HOUR	SATURDAY POST-GAME PEAK HOUR
108th Street at Astoria Boulevard	Unmitigatable impact.	Mitigation not required.	Modify signal timing: shift 1 s green time from EB/WB phase to WB lead phase [EB/WB green time shifts from 34 s to 33 s; WB lead phase shifts from 9 s to 10 s].
108th Street at Northern Boulevard (RT. 25A)	Install "No Standing Anytime" regulations along the east curb of the NB approach for 250-ft from the intersection to allow for two moving lanes. Install "No Standing Anytime" regulations along the west curb of the SB approach for 250-ft from the intersection to allow for two moving lanes. Restripe NB approach of 108th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restripe SB approach of 108th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Modify signal timing: shift 2 s green time from EB/WB left-turn phase to EB/WB phase; shift 1 s green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 71 s to 74 s; EB/WB left-turn phase shifts from 9 s to 7 s; NB/SB phase shifts from 25 s to 24 s].	Install "No Standing Anytime" regulations along the east curb of the NB approach for 250-ft from the intersection to allow for two moving lanes. Install "No Standing Anytime" regulations along the west curb of the SB approach for 250-ft from the intersection to allow for two moving lanes. Restripe NB approach of 108th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restripe SB approach of 108th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Modify signal timing: shift 4 s green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 66 s to 70 s; NB/SB phase shifts from 30 s to 26 s].	Install "No Standing Anytime" regulations along the east curb of the NB approach for 250-ft from the intersection to allow for two moving lanes. Install "No Standing Anytime" regulations along the west curb of the SB approach for 250-ft from the intersection to allow for two moving lanes. Restripe NB approach of 108th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restripe SB approach of 108th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Modify signal timing: shift 4 s green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 66 s to 70 s; NB/SB phase shifts from 30 s to 26 s].
114th Street at Northern Boulevard (RT. 25A)	Prohibit left-turns from WB Northern Boulevard onto SB 114th Street to allow for three exclusive through lanes. Divert left-turning turning to NB 112th Street and then to SEB 114th Street. Prohibit parking along east curb of SB 114th Street for 200 ft and restripe as two 11-ft moving lanes. Restripe SB 114th Street receiving lanes as two 11-ft moving lanes with parking on both sides. Modify signal timing: Eliminate WB lead phase. Shift 12 s green time from WB lead phase to SB phase [SB green time shifts from 23 s to 35 s]. Shift 10 s green time from WB lead phase to EB/WB phase [EB/WB green time shifts from 65 s to 75 s].	Prohibit left-turns from WB Northern Boulevard onto SB 114th Street to allow for three exclusive through lanes. Divert left-turning turning to NB 112th Street and then to SB 114th Street. Prohibit parking along east curb of SB 114th Street for 200 ft and restripe as two 11-ft moving lanes. Restripe SB 114th Street receiving lanes as two 11-ft moving lanes with parking on both sides. Modify signal timing: Eliminate WB lead phase. Shift 10 s green time from WB lead phase to SB phase [SB green time shifts from 25 s to 35 s]. Shift 12 s green time from WB lead phase to EB/WB phase [EB/WB green time shifts from 63 s to 75 s].	Prohibit left-turns from WB Northern Boulevard onto SB 114th Street to allow for three exclusive through lanes. Divert left-turning turning to NB 112th Street and then to SEB 114th Street. Prohibit parking along east curb of SB 114th Street for 200 ft and restripe as two 11-ft moving lanes. Restripe SB 114th Street receiving lanes as two 11-ft moving lanes with parking on both sides. Modify signal timing: Eliminate WB lead phase. Shift 10 s green time from WB lead phase to SB phase [SB green time shifts from 25 s to 35 s]. Shift 12 s green time from WB lead phase to EB/WB phase [EB/WB green time shifts from 63 s to 75 s].
126th Street at Northern Boulevard (RT. 25A)	Install Jersey barriers on WB approach between the right-most lane and center lane to allow the Van Wyck and Whitestone Expressway Ramp to bypass the signal and operate as free flow through the intersection. Close the ramp from EB Northern Blvd ramp to 126th Street. Divert traffic from the closed ramp through the intersection to SB 126th Pl to 34th Ave. Widen the EB Northern approach from two 12-ft lanes to three 10-ft lanes. Prohibit pedestrian crossing in the east crosswalk and divert pedestrians to the new crossing at 126th Place at Northern Boulevard. Modify signal timing: shift 3 s of green time from EB GCP/Astoria Blvd ramp phase to EB Northern Blvd phase [EB Northern Blvd green time shifts from 25 s to 28 s; EB GCP/Astoria Blvd ramp green time shifts from 55 s to 52 s].	Install Jersey barriers on WB approach between the right-most lane and center lane to allow the Van Wyck and Whitestone Expressway Ramp to bypass the signal and operate as free flow through the intersection. Close the ramp from EB Northern Blvd ramp to 126th Street. Divert traffic from the closed ramp through the intersection to SB 126th Pl to 34th Ave. Widen the EB Northern approach from two 12-ft lanes to three 10-ft lanes. Prohibit pedestrian crossing in the east crosswalk and divert pedestrians to the new crossing at 126th Place at Northern Boulevard. Modify signal timing: shift 1 s of green time from EB GCP/Astoria Blvd ramp phase to NB 126th St phase [NB 126th St green time shifts from 25 s to 26 s; EB GCP/Astoria Blvd ramp green time shifts from 45 s to 44 s]. [Measures reflect improvements needed for the Weekday Non-game AM, midday, PM,	Partially mitigated. Install Jersey barriers on WB approach between the right-most lane and center lane to allow the Van Wyck and Whitestone Expressway Ramp to bypass the signal and operate as free flow through the intersection. Close the ramp from EB Northern Blvd ramp to 126th Street. Divert traffic from the closed ramp through the intersection to SB 126th Pl to 34th Ave. Widen the EB Northern approach from two 12-ft lanes to three 10-ft lanes. Prohibit pedestrian crossing in the east crosswalk and divert pedestrians to the new crossing at 126th Place at Northern Boulevard. Modify signal timing: shift 1 s of green time from EB GCP/Astoria Blvd ramp phase to NB 126th St phase and 5 s green time from EB Northern Blvd phase to NB 126th St phase [NB 126th St green time shifts from 25 s to 26 s; EB GCP/Astoria Blvd ramp green time shifts from 45 s to 44
Prince Street at Northern Boulevard (RT. 25A)	Unmitigatable impact.	Unmitigatable impact.	Unmitigatable impact.
Main Street at Northern Boulevard (RT. 25A)	Unmitigatable impact.	Mitigation not required.	Unmitigatable impact.
Union Street at Northern Boulevard (RT. 25A)	Install "No Standing 7AM - 10PM" regulations along the north curb of the WB Northern Blvd approach 200-ft from the intersection to allow for one 10-ft daylighted shared through-right lane. Modify Signal Timing: Shift 3 s of green time from NB/SB phase to EB/WB phase [NB/SB green time shifts from 44 s to 42 s; EB/WB green time shifts from 45 s to 47 s].	Install "No Standing 7AM - 10PM" regulations along the north curb of the WB Northern Blvd approach 200-ft from the intersection to allow for one 10-ft daylighted shared through-right lane. Modify Signal Timing: Shift 3 s of green time from NB/SB phase to EB/WB phase [NB/SB green time shifts from 44 s to 41 s; EB/WB green time shifts from 45 s to 48 s].	Install "No Standing 7AM - 10PM" regulations along the north curb of the WB Northern Blvd approach 200-ft from the intersection to allow for one 10-ft daylighted shared through-right lane. Modify Signal Timing: Shift 3 s of green time from NB/SB phase to EB/WB phase [NB/SB green time shifts from 44 s to 41 s; EB/WB green time shifts from 45 s to 48 s].
Parsons Boulevard at Northern Boulevard (RT. 25A)	Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 1 s of green time from EB/WB protected left-turn phase to NB/SB phase and 2 s green time from EB/WB protected left-turn phase to EB/WB phase [NB/SB green time shifts from 36 s to 37 s; EB/WB protected left-turn green time shifts from 12 s to 9 s; EB/WB green time shifts from 50 s to 52 s].	Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150-ft from the intersection to allow for one 10-ft daylighted right-turn lane.	Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150-ft from the intersection to allow for one 10-ft daylighted right-turn lane.
114th Street at 34th Avenue	Modify Signal Timing: Shift 3 s of green time from EB phase to SB phase [EB green time shifts from 52 s to 49 s; SB green time shifts from 28 s to 31 s].	Modify Signal Timing: Shift 3 s of green time from EB phase to SB phase [EB green time shifts from 52 s to 49 s; SB green time shifts from 28 s to 31 s].	Modify Signal Timing: Shift 3 s of green time from EB phase to SB phase [EB green time shifts from 52 s to 49 s; SB green time shifts from 28 s to 31 s].
126th Street/GCP Ramp at 34th Avenue	Partially mitigated. Restripe the NB 126th Street approach from two 11-ft travel lanes, one 12-ft travel lane, and one 7-ft hatched median to one 12-ft exclusive left-turn lane, two 12-ft travel lanes and one 5-ft Class II bicycle lane. Widen roadway on the east leg of the intersection to 44 ft to have two 11-ft WB approach lanes and two 11-ft EB receiving lanes. Close the ramp from EB Northern Blvd ramp to 126th Street. Construct a channelized right-turn from the GCP/EB Astoria Blvd ramp to WB Shea Road. Reconstruct the GCP/EB Astoria Blvd ramp to have one 11-ft exclusive left-turn lane and two 11-ft travel lanes. Modify signal phasing and timing plan: EB/WB phase will have 65 s green time; NB/SB phase will have 45 s green time [each phase will have 3 s amber and 2 s all red time].	Partially mitigated. Restripe the NB 126th Street approach from two 11-ft travel lanes, one 12-ft travel lane, and one 7-ft hatched median to one 12-ft exclusive left-turn lane, two 12-ft travel lanes and one 5-ft Class II bicycle lane. Widen roadway on the east leg of the intersection to 44 ft to have two 11-ft WB approach lanes and two 11-ft EB receiving lanes. Close the ramp from EB Northern Blvd ramp to 126th Street. Construct a channelized right-turn from the GCP/EB Astoria Blvd ramp to WB Shea Road. Reconstruct the GCP/EB Astoria Blvd ramp to have one 11-ft exclusive left-turn lane and two 11-ft travel lanes. Modify signal phasing and timing plan: EB/WB phase will have 65 s green time; NB/SB phase will have 45 s green time [each phase will have 3 s amber and 2 s all red time].	Partially mitigated. Restripe the NB 126th Street approach from two 11-ft travel lanes, one 12-ft travel lane, and one 7-ft hatched median to one 12-ft exclusive left-turn lane, two 12-ft travel lanes and one 5-ft Class II bicycle lane. Widen roadway on the east leg of the intersection to 44 ft to have two 11-ft WB approach lanes and two 11-ft EB receiving lanes. Close the ramp from EB Northern Blvd ramp to 126th Street. Construct a channelized right-turn from the GCP/EB Astoria Blvd ramp to WB Shea Road. Reconstruct the GCP/EB Astoria Blvd ramp to have one 11-ft exclusive left-turn lane and two 11-ft travel lanes. Modify signal phasing and timing plan: EB/WB phase will have 45 s green time; NB/SB phase will have 65 s green time [each phase will have 3 s amber and 2 s all red time].
108th Street at Roosevelt Avenue	Install "No Standing Anytime" regulations along the east curb of the NB 108th Street approach 150-ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB 108th Street approach 150-ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane.	Partially mitigated. Install "No Standing Anytime" regulations along the east curb of the NB 108th Street approach 150-ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB 108th Street approach 150-ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane.	Install "No Standing Anytime" regulations along the east curb of the NB 108th Street approach 150-ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB 108th Street approach 150-ft from the intersection to allow for one 11-ft left-through lane and one 11-ft right-turn lane.
111th Street at Roosevelt Avenue	Install "No Standing 10 AM - 10 PM" regulations along the north curb of the WB Roosevelt Avenue approach 100-ft from the intersection to allow for one 11-ft left-through lane and one 10-ft right-turn lane.	Install "No Standing 10 AM - 10 PM" regulations along the north curb of the WB Roosevelt Avenue approach 100-ft from the intersection to allow for one 11-ft left-through lane and one 10-ft right-turn lane.	Install "No Standing 10 AM - 10 PM" regulations along the north curb of the WB Roosevelt Avenue approach 100-ft from the intersection to allow for one 11-ft left-through lane and one 10-ft right-turn lane.

TABLE 6

2018 (PHASE 1A) SUMMARY OF GAMEDAY MITIGATION MEASURES

114th Street at Roosevelt Avenue	Shift the centerline of the SB 114th Street approach 2 feet to the east. Install "No Standing Anytime" regulations along the west curb of the SB 114th Street approach 150-ft from the stop bar to allow for one 12-ft shared left-through lane and one 10-ft right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Roosevelt Avenue approach 150-ft from the stop bar to allow for one 11-ft left-turn lane and one 11-ft shared through-right lane. Shift center line of WB Roosevelt Avenue approach 11 ft to the south. Restripe WB Roosevelt Avenue approach as one 11-ft left-turn pocket (250 feet long), one 11-ft through lane, and one 11-ft right-turn lane. Modify Signal Timing: Shift 3 s of green time from EB/WB phase to NB/SB phase [EB/WB green time shifts from 80 s to 77 s; NB/SB green time shifts from 30 s to 33 s].	Partially mitigated. Shift the centerline of the SB 114th Street approach 2 feet to the east. Install "No Standing Anytime" regulations along the west curb of the SB 114th Street approach 150-ft from the stop bar to allow for one 12-ft shared left-through lane and one 10-ft right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Roosevelt Avenue approach 150-ft from the stop bar to allow for one 11-ft left-turn lane and one 11-ft shared through-right lane. Shift center line of WB Roosevelt Avenue approach 11 ft to the south. Restripe WB Roosevelt Avenue approach as one 11-ft left-turn pocket (250 feet long), one 11-ft through lane, and one 11-ft right-turn lane. Modify Signal Timing: Shift 4 s of green time from EB/WB phase to NB/SB phase [EB/WB green time shifts from 80 s to 76 s; NB/SB green time shifts from 30 s to 34 s].	Partially Mitigated. Shift the centerline of the SB 114th Street approach 2 feet to the east. Install "No Standing Anytime" regulations along the west curb of the SB 114th Street approach 150-ft from the stop bar to allow for one 12-ft shared left-through lane and one 10-ft right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Roosevelt Avenue approach 150-ft from the stop bar to allow for one 11-ft left-turn lane and one 11-ft shared through-right lane. Shift center line of WB Roosevelt Avenue approach 11 ft to the south. Restripe WB Roosevelt Avenue approach as one 11-ft left-turn pocket (250 feet long), one 11-ft through lane, and one 11-ft right-turn lane. Modify Signal Timing: Shift 4 s of green time from EB/WB phase to NB/SB phase [EB/WB green time shifts from 80 s to 76 s; NB/SB green time shifts from 30 s to 34 s].
126th Street at Roosevelt Avenue	Unmitigatable impact. Restripe SB approach as one 11-ft right-turn lane and one 12-ft shared left-through lane. New signal phasing and timing plan: Shared EB/WB phase receives 67 s green time; EB lag phase with SB right-turns receives 13 s green time; NB/SB phase receives 25 s green time [each phase will have 3 s amber and 2 s all red time]. Traffic Enforcement Agents should monitor traffic conditions and direct traffic accordingly.	Unmitigatable impact. Restripe SB approach as one 11-ft right-turn lane and one 12-ft shared left-through lane. New signal phasing and timing plan: Shared EB/WB phase receives 65 s green time; EB lag phase with SB right-turns receives 15 s green time; NB/SB phase receives 25 s green time [each phase will have 3 s amber and 2 s all red time]. Traffic Enforcement Agents should monitor traffic conditions and direct traffic accordingly.	Partially Mitigated. Restripe SB approach as one 12-ft right-turn lane and one 11-ft shared left-through lane. New signal phasing and timing plan: Shared EB/WB phase receives 42 s green time; EB lag phase with SB right-turns receives 7 s green time; NB/SB phase receives 36 s green time [each phase will have 3 s amber and 2 s all red time]. Traffic Enforcement Agents should monitor traffic conditions and direct traffic accordingly.
College Point Boulevard at Roosevelt Avenue	Partially Mitigated Restripe the WB Roosevelt Avenue approach from one 13-ft travel lane and one 17-ft travel lane to two 15-ft travel lanes. Restripe the EB Roosevelt Avenue approach from one 14-ft travel lane and one 12-ft travel lane to two 13-ft travel lanes. Restripe the NB College Point Boulevard approach from one 9-ft exclusive left-turn lane, one 13-ft travel lane, and one 18-ft travel lane with parking to two 10-ft exclusive left-turn lanes, and two 10-ft travel lanes lanes for 200 ft. Restripe the SB College Point Boulevard approach from one 11-ft travel lane and one 19-ft travel lane to three 10-ft travel lanes for 200 ft. Restripe the NB/SB lanes in the Roosevelt Avenue median from one NB 24-ft travel lane, one NB 11-ft travel lane, one NB 10-ft exclusive left-turn lane, one SB 10-ft travel lane and one SB 20-ft travel lane to one NB 15-ft travel lane, one NB 10-ft travel lane, two NB 10-ft exclusive left-turn lanes, and three SB 10-ft travel lanes. Extend median on the north leg 3 ft to the east and shift NB receiving lanes 3 ft to the east. Taper 45 ft to meet existing lanes. Install "No Standing Anytime" regulations along the east curb of the NB approach of College Point Boulevard for 250 ft.	Partially Mitigated. Restripe the WB Roosevelt Avenue approach from one 13-ft travel lane and one 17-ft travel lane to two 15-ft travel lanes. Restripe the EB Roosevelt Avenue approach from one 14-ft travel lane and one 12-ft travel lane to two 13-ft travel lanes. Restripe the NB College Point Boulevard approach from one 9-ft exclusive left-turn lane, one 13-ft travel lane, and one 18-ft travel lane with parking to two 10-ft exclusive left-turn lanes, and two 10-ft travel lanes lanes for 200 ft. Restripe the SB College Point Boulevard approach from one 11-ft travel lane and one 19-ft travel lane to three 10-ft travel lanes for 200 ft. Restripe the NB/SB lanes in the Roosevelt Avenue median from one NB 24-ft travel lane, one NB 11-ft travel lane, one NB 10-ft exclusive left-turn lane, one SB 10-ft travel lane and one SB 20-ft travel lane to one NB 15-ft travel lane, one NB 10-ft travel lane, two NB 10-ft exclusive left-turn lanes, and three SB 10-ft travel lanes. Extend median on the north leg 3 ft to the east and shift NB receiving lanes 3 ft to the east. Taper 45 ft to meet existing lanes. Install "No Standing Anytime" regulations along the east curb of the NB approach of College Point Boulevard for 250 ft. Install "No Standing Anytime" regulations along the west curb of the SB approach of College	Partially Mitigated. Restripe the WB Roosevelt Avenue approach from one 13-ft travel lane and one 17-ft travel lane to two 15-ft travel lanes. Restripe the EB Roosevelt Avenue approach from one 14-ft travel lane and one 12-ft travel lane to two 13-ft travel lanes. Restripe the NB College Point Boulevard approach from one 9-ft exclusive left-turn lane, one 13-ft travel lane, and one 18-ft travel lane with parking to two 10-ft exclusive left-turn lanes, and two 10-ft travel lanes lanes for 200 ft. Restripe the SB College Point Boulevard approach from one 11-ft travel lane and one 19-ft travel lane to three 10-ft travel lanes for 200 ft. Restripe the NB/SB lanes in the Roosevelt Avenue median from one NB 24-ft travel lane, one NB 11-ft travel lane, one NB 10-ft exclusive left-turn lane, one SB 10-ft travel lane and one SB 20-ft travel lane to one NB 15-ft travel lane, one NB 10-ft travel lane, two NB 10-ft exclusive left-turn lanes, and three SB 10-ft travel lanes. Extend median on the north leg 3 ft to the east and shift NB receiving lanes 3 ft to the east. Taper 45 ft to meet existing lanes. Install "No Standing Anytime" regulations along the east curb of the NB approach of College Point Boulevard for 250 ft.
Prince Street at Roosevelt Avenue	Modify Signal Timing: Shift 2 s of green time from SB phase to EB/WB phase [EB/WB green time shifts from 63 s to 65 s; SB green time shifts from 47 s to 45 s]. [Measures reflect improvements needed for the Weekday non-game PM peak periods.]	Mitigation not required.	Mitigation not required.
Main Street at Roosevelt Avenue	Modify Signal Timing: Shift 4 s of green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 45 s to 49 s; NB/SB green time shifts from 65 s to 61 s].	Modify Signal Timing: Shift 4 s of green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 39 s to 43 s; NB/SB green time shifts from 41 s to 37 s].	Modify Signal Timing: Shift 4 s of green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 39 s to 43 s; NB/SB green time shifts from 41 s to 37 s].
Union Street at Roosevelt Avenue	Unmitigatable Impact.	Unmitigatable Impact.	Unmitigatable impact.
Parsons Boulevard at Roosevelt Avenue	Modify Signal Timing: Shift 2 s green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 55 s to 57 s; NB/SB green time shifts from 55 s to 53 s]. Install "No Standing 7 AM - 10 AM, 4 PM - 7 PM, Mon-Fri" regulations on the NB approach 75 feet from the intersection to allow for a 10-ft daylighted right-turn lane.	Modify Signal Timing: Shift 1 s of green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 40 s to 41 s; NB/SB green time shifts from 40 s to 39 s]. [Measures reflect improvements needed for the Saturday Non-game peak period.]	Modify Signal Timing: Shift 1 s of green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 39 s to 43 s; NB/SB green time shifts from 41 s to 37 s]. [Measures reflect improvements needed for the Saturday Non-game peak period.]
Main Street at Kissena Boulevard	Mitigation not required.	Modify Signal Timing: Shift 1 s of green time from WB Kissena Blvd phase to NB/SB phase [WB green time shifts from 40 s to 39 s; NB/SB green time shifts from 40 s to 41 s]. [Measures reflect improvements needed for the Saturday Non-game peak period.]	Modify Signal Timing: Shift 1 s of green time from WB Kissena Blvd phase to NB/SB phase [WB green time shifts from 40 s to 39 s; NB/SB green time shifts from 40 s to 41 s]. [Measures reflect improvements needed for the Saturday Non-game peak period.]
College Point Boulevard at Sanford Avenue	Mitigation not required.	Mitigation not required.	Mitigation not required.
Union Street at Sanford Avenue	Mitigation not required.	Mitigation not required.	Mitigation not required.
Parsons Boulevard at Sanford Avenue	Mitigation not required.	Mitigation not required.	Mitigation not required.
College Point Boulevard at 32nd Avenue	Mitigation not required.	Mitigation not required.	Mitigation not required.
College Point Boulevard at Northern Boulevard Service Road	Mitigation not required.	Mitigation not required.	Mitigation not required.
Boat Basin Road at Stadium Road	Partially Mitigated. Install an actuated controller. Modify signal phasing and timing plan: EB/WB phase will have 39 s green time; NB phase will have 16 s green time; SB phase will have 50 s green time [each phase will have 3 s amber and 2 s all red time]. NB/SB pedestrians will cross during the SB phase.	Install an actuated controller. Modify signal phasing and timing plan: EB/WB phase will have 33 s green time; NB phase will have 14 s green time; SB phase will have 58 s green time [each phase will have 3 s amber and 2 s all red time]. NB/SB pedestrians will cross during the SB phase.	Install an actuated controller. Modify signal phasing and timing plan: EB/WB phase will have 65 s green time; NB phase will have 11 s green time; SB phase will have 29 s green time [each phase will have 3 s amber and 2 s all red time]. NB/SB pedestrians will cross during the SB phase.
UNSIGNALIZED INTERSECTIONS			
Willets Point Boulevard at 126th Street	Intersection no longer exists under the Build condition.	Intersection no longer exists under the Build condition.	Intersection no longer exists under the Build condition.
Boat Basin Road at Worlds Fair Marina	Install traffic signal with the following timing plan: EB will have 10 s green time; WB + NB-Right will have 40 s green time; NB will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Stripe WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane. Stripe NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 10 s green time; WB + NB-Right will have 40 s green time; NB will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Stripe WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane. Stripe NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 10 s green time; WB + NB-Right will have 40 s green time; NB will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Stripe WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane. Stripe NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane. Intersection meets NYCDOT Signal Warrant Criteria.
Willets Point Boulevard at Northern Boulevard	Mitigation not required.	Mitigation not required.	Mitigation not required.
Boat Basin Road at Stadium Road / Citifield Entrance 8	Intersection no longer exists under the Build condition.	Intersection no longer exists under the Build condition.	Intersection no longer exists under the Build condition.
Grand Central Parkway Ramp at West Park Loop/Stadium Road	Install traffic signal with the following timing plan: EB will have 45 s green time; WB will have 25 s green time; NB/SB will have 35 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Stripe the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 45 s green time; WB will have 25 s green time; NB/SB will have 35 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Stripe the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 39 s green time; WB will have 22 s green time; NB/SB will have 44 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Stripe the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. [Measures reflect improvements needed for the Weekday Non-game Midday, Saturday Non-game Midday, Weekday Pre-game, and Saturday Pre-game peak periods.] Intersection meets NYCDOT Signal Warrant Criteria.
126th Street at 36th Avenue	Unmitigatable impact. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Unmitigatable impact. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Unmitigatable impact. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.

TABLE 6

2018 (PHASE 1A) SUMMARY OF GAMEDAY MITIGATION MEASURES

126th Street at 37th Avenue	Unmitigatable impact. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Unmitigatable impact. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Unmitigatable impact. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.
Northern Boulevard at 126th Place	Mitigation not required. Restripe the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crosswalk across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Restripe the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crosswalk across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Restripe the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crosswalk across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.

NOTE: This table has been revised for the Final SEIS.

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

TABLE 10

2028 (PHASE 1B) SUMMARY OF NON-GAMEDAY MITIGATION MEASURES

126th Street at Roosevelt Avenue	Modify signal phasing and timing plan: EB lead phase will have 9 s green time; EB/WB phase will have 52 s green time; WB lag phase will have 7 s green time; NB/SB phase will have 32 s green time; [each phase will have 3 s amber and 2 s all red time.]B22 Restrict NB approach from one wide 25-ft lane to two 12-ft wide lanes with a 1-ft buffer at the east curb.	Partially mitigated. Modify signal phasing and timing plan: EB lead phase will have 8 s green time; EB/WB phase will have 55 s green time; WB lag phase will have 8 s green time; NB/SB phase will have 29 s green time; [each phase will have 3 s amber and 2 s all red time.] Restrict NB approach from one wide 25-ft lane to two 12-ft wide lanes with a 1-ft buffer at the east curb.	Unmitigated impact Modify signal phasing and timing plan: EB lead phase will have 7 s green time; EB/WB phase will have 59 s green time; WB lag phase will have 7 s green time; NB/SB phase will have 29 s green time; [each phase will have 3 s amber and 2 s all red time.] Restrict NB approach from one wide 25-ft lane to two 12-ft wide lanes with a 1-ft buffer at the east curb.	Partially mitigated. Modify signal phasing and timing plan: EB lead phase will have 7 s green time; EB/WB phase will have 59 s green time; WB lag phase will have 7 s green time; NB/SB phase will have 29 s green time; [each phase will have 3 s amber and 2 s all red time.] Restrict NB approach from one wide 25-ft lane to two 12-ft wide lanes with a 1-ft buffer at the east curb.
	Restrict the WB Roosevelt Avenue approach from one 13-ft travel lane and one 17-ft travel lane to two 15-ft travel lanes. Restrict the EB Roosevelt Avenue approach from one 14-ft travel lane and one 12-ft travel lane to two 15-ft travel lanes. Restrict the NB College Point Boulevard approach from one 9-ft exclusive left-turn lane, one 13-ft travel lane, and one 18-ft travel lane with parking to two 10-ft exclusive left-turn lanes, and two 10-ft travel lanes for 200 ft. Restrict the SB College Point Boulevard approach from one 11-ft travel lane and one 19-ft travel lane to three 10-ft travel lanes for 200 ft. Restrict the NB/SB lanes in the Roosevelt Avenue median from one NB 24-ft travel lane, one NB 11-ft travel lane, one NB 10-ft exclusive left-turn lane, one SB 10-ft travel lane and one SB 20-ft travel lane to one NB 15-ft travel lane, one NB 10-ft exclusive left-turn lane, and three SB 10-ft travel lanes. Extend median on the north leg 3 ft to the east and shift NB receiving lanes 3 ft to the east. Taper 45 ft to meet existing lanes. Install "No Standing Anytime" regulations along the east curb of the NB approach of College Point Boulevard for 250 ft. Install "No Standing Anytime" regulations along the west curb of the SB approach of College Point Boulevard for 200 ft. Divert SB right-turn traffic on College Point Boulevard to 39th Avenue and Janet Place. Divert WB left-turn traffic on Roosevelt Avenue to Janet Place and 39th Avenue. Modify signal phasing and timing plan: EB/WB will have 33 s green time; EB-lag phase will have 20 s green time; NB lead phase will have 17 s green time; NB/SB phase will have 30 s green time [each phase will have 3 s amber and 2 s all red time].	Partially Mitigated Restrict the WB Roosevelt Avenue approach from one 13-ft travel lane and one 17-ft travel lane to two 15-ft travel lanes. Restrict the EB Roosevelt Avenue approach from one 14-ft travel lane and one 12-ft travel lane to two 15-ft travel lanes. Restrict the NB College Point Boulevard approach from one 9-ft exclusive left-turn lane, one 13-ft travel lane, and one 18-ft travel lane with parking to two 10-ft exclusive left-turn lanes, and two 10-ft travel lanes for 200 ft. Restrict the SB College Point Boulevard approach from one 11-ft travel lane and one 19-ft travel lane to three 10-ft travel lanes for 200 ft. Restrict the NB/SB lanes in the Roosevelt Avenue median from one NB 24-ft travel lane, one NB 11-ft travel lane, one NB 10-ft exclusive left-turn lane, one SB 10-ft travel lane and one SB 20-ft travel lane to one NB 15-ft travel lane, one NB 10-ft exclusive left-turn lane, and three SB 10-ft travel lanes. Extend median on the north leg 3 ft to the east and shift NB receiving lanes 3 ft to the east. Taper 45 ft to meet existing lanes. Install "Standing Anytime" regulations along the east curb of the NB approach of College Point Boulevard for 250 ft. Install "No Standing Anytime" regulations along the west curb of the SB approach of College Point Boulevard for 200 ft. Divert SB right-turn traffic on College Point Boulevard to 39th Avenue and Janet Place. Divert WB left-turn traffic on Roosevelt Avenue to Janet Place and 39th Avenue. Modify signal phasing and timing plan: EB/WB will have 35 s green time; EB-lag phase will have 20 s green time; NB lead phase will have 19 s green time; NB/SB phase will have 26 s green time [each phase will have 3 s amber and 2 s all red time].	Partially Mitigated Restrict the WB Roosevelt Avenue approach from one 13-ft travel lane and one 17-ft travel lane to two 15-ft travel lanes. Restrict the EB Roosevelt Avenue approach from one 14-ft travel lane and one 12-ft travel lane to two 15-ft travel lanes. Restrict the NB College Point Boulevard approach from one 9-ft exclusive left-turn lane, one 13-ft travel lane, and one 18-ft travel lane with parking to two 10-ft exclusive left-turn lanes, and two 10-ft travel lanes for 200 ft. Restrict the SB College Point Boulevard approach from one 11-ft travel lane and one 19-ft travel lane to three 10-ft travel lanes for 200 ft. Restrict the NB/SB lanes in the Roosevelt Avenue median from one NB 24-ft travel lane, one NB 11-ft travel lane, one NB 10-ft exclusive left-turn lane, one SB 10-ft travel lane and one SB 20-ft travel lane to one NB 15-ft travel lane, one NB 10-ft exclusive left-turn lane, and three SB 10-ft travel lanes. Extend median on the north leg 3 ft to the east and shift NB receiving lanes 3 ft to the east. Taper 45 ft to meet existing lanes. Install "No Standing Anytime" regulations along the east curb of the NB approach of College Point Boulevard for 250 ft. Install "No Standing Anytime" regulations along the west curb of the SB approach of College Point Boulevard for 200 ft. Divert SB right-turn traffic on College Point Boulevard to 39th Avenue and Janet Place. Divert WB left-turn traffic on Roosevelt Avenue to Janet Place and 39th Avenue. Modify signal phasing and timing plan: EB/WB will have 27 s green time; EB-lag phase will have 24 s green time; NB lead phase will have 19 s green time; NB/SB phase will have 30 s green time [each phase will have 3 s amber and 2 s all red time].	Partially mitigated. Restrict the WB Roosevelt Avenue approach from one 13-ft travel lane and one 17-ft travel lane to two 15-ft travel lanes. Restrict the EB Roosevelt Avenue approach from one 14-ft travel lane and one 12-ft travel lane to two 15-ft travel lanes. Restrict the NB College Point Boulevard approach from one 9-ft exclusive left-turn lane, one 13-ft travel lane, and one 18-ft travel lane with parking to two 10-ft exclusive left-turn lanes, and two 10-ft travel lanes for 200 ft. Restrict the SB College Point Boulevard approach from one 11-ft travel lane and one 19-ft travel lane to three 10-ft travel lanes for 200 ft. Restrict the NB/SB lanes in the Roosevelt Avenue median from one NB 24-ft travel lane, one NB 11-ft travel lane, one NB 10-ft exclusive left-turn lane, one SB 10-ft travel lane and one SB 20-ft travel lane to one NB 15-ft travel lane, one NB 10-ft exclusive left-turn lane, and three SB 10-ft travel lanes. Extend median on the north leg 3 ft to the east and shift NB receiving lanes 3 ft to the east. Taper 45 ft to meet existing lanes. Install "No Standing Anytime" regulations along the east curb of the NB approach of College Point Boulevard for 250 ft. Install "No Standing Anytime" regulations along the west curb of the SB approach of College Point Boulevard for 200 ft. Divert SB right-turn traffic on College Point Boulevard to 39th Avenue and Janet Place. Divert WB left-turn traffic on Roosevelt Avenue to Janet Place and 39th Avenue. Modify signal phasing and timing plan: EB/WB will have 27 s green time; EB-lag phase will have 24 s green time; NB lead phase will have 19 s green time; NB/SB phase will have 30 s green time [each phase will have 3 s amber and 2 s all red time].
College Point Boulevard at Roosevelt Avenue				
Prince Street at Roosevelt Avenue	Modify Signal Timing: Shift 2 s of green time from SB phase to EB/WB phase [EB/WB green time shifts from 63 s to 65 s; SB green time shifts from 47 s to 45 s].	Mitigation not required.	Modify Signal Timing: Shift 2 s of green time from SB phase to EB/WB phase [EB/WB green time shifts from 63 s to 65 s; SB green time shifts from 47 s to 45 s].	Mitigation not required.
Main Street at Roosevelt Avenue	Modify Signal Timing: Shift 2 s of green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 45 s to 47 s; NB/SB green time shifts from 65 s to 63 s].	Partially Mitigated. Modify Signal Timing: Shift 2 s of green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 39 s to 41 s; NB/SB green time shifts from 41 s to 39 s].	Modify Signal Timing: Shift 4 s of green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 45 s to 49 s; NB/SB green time shifts from 65 s to 61 s].	Partially mitigated. Modify Signal Timing: Shift 4 s of green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 39 s to 43 s; NB/SB green time shifts from 41 s to 37 s].
Union Street at Roosevelt Avenue	Unmitigatable impact. Modify Signal Timing: Shift 2 s green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 55 s to 57 s; NB/SB green time shifts from 55 s to 53 s]. Install "No Standing 7 AM - 10 AM, 4 PM - 7 PM, Mon-Fri" regulations on the NB approach 75 feet from the intersection to allow for a 10-ft daylighted right-turn lane.	Unmitigatable impact. Modify Signal Timing: Shift 2 s green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 55 s to 59 s; NB/SB green time shifts from 55 s to 51 s]. Install "No Standing 7 AM - 10 AM, 4 PM - 7 PM, Mon-Fri" regulations on the NB approach 75 feet from the intersection to allow for a 10-ft daylighted right-turn lane.	Unmitigatable impact. Modify Signal Timing: Shift 4 s green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 55 s to 59 s; NB/SB green time shifts from 55 s to 51 s]. Install "No Standing 7 AM - 7 PM, Mon-Fri" regulations on the NB approach 75 feet from the intersection to allow for a 10-ft daylighted right-turn lane. [Measures reflect improvements needed for the Weekday Pre-game PM peak period.]	Unmitigatable impact. Modify Signal Timing: Shift 2 s of green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 40 s to 42 s; NB/SB green time shifts from 40 s to 38 s]. Install "No Standing 10 AM - 8 PM, Saturday" regulations on the NB approach 75 feet from the intersection to allow for a 10-ft daylighted right-turn lane.
Parsons Boulevard at Roosevelt Avenue				
Main Street at Kissena Boulevard	Mitigation not required.	Mitigation not required.	Mitigation not required.	Modify Signal Timing: Shift 1 s of green time from WB Kissena Blvd phase to NB/SB phase [WB green time shifts from 40 s to 39 s; NB/SB green time shifts from 40 s to 41 s].
College Point Boulevard at Sanford Avenue	Mitigation not required.	Mitigation not required.	Mitigation not required.	Mitigation not required.
Union Street at Sanford Avenue	Mitigation not required.	Mitigation not required.	Mitigation not required.	Mitigation not required.
Parsons Boulevard at Sanford Avenue	Shift NB centerline 1-ft to the west to allow for a 20-ft NB approach. Install "No Standing 7 AM - 7 PM, Mon-Fri" regulations on the NB approach 75 feet from the intersection to allow for a 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 1 s green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 40 s to 39 s; NB/SB green time shifts from 40 s to 41 s].	Shift NB centerline 1-ft to the west to allow for a 20-ft NB approach. Install "No Standing 7 AM - 7 PM, Mon-Fri" regulations on the NB approach 75 feet from the intersection to allow for a 10-ft daylighted right-turn lane.	Shift NB centerline 1-ft to the west to allow for a 20-ft NB approach. Install "No Standing 7 AM - 7 PM, Mon-Fri" regulations on the NB approach 75 feet from the intersection to allow for a 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 2 s green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 40 s to 38 s; NB/SB green time shifts from 40 s to 42 s].	Unmitigatable impact. Shift NB centerline 1-ft to the west to allow for a 20-ft NB approach. Install "No Standing 7 AM - 7 PM, Mon-Fri" regulations on the NB approach 75 feet from the intersection to allow for a 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 2 s green time from NB/SB phase to EB/WB phase [EB/WB green time shifts from 40 s to 39 s; NB/SB green time shifts from 40 s to 41 s].
College Point Boulevard at 32nd Avenue	Mitigation not required.	Mitigation not required.	Mitigation not required.	Mitigation not required.
College Point Boulevard at Northern Boulevard Service Road	Modify Signal Timing: Shift 1 s of green time from NB/SB phase to WB phase [NB/SB green time shifts from 51 s to 50 s; WB green time shifts from 29 s to 30 s]. Install an actuated controller. Modify signal phasing and timing plan: EB lead phase will have 7 s green time; EB/WB phase will have 26 s green time; WB lag phase will have 7 s green time; NB/SB phase will have 60 s green time; [each phase will have 3 s amber and 2 s all red time].	Modify Signal Timing: Shift 3 s of green time from NB/SB phase to WB phase [NB/SB green time shifts from 51 s to 48 s; WB green time shifts from 29 s to 32 s]. Install an actuated controller. Modify signal phasing and timing plan: EB lead phase will have 7 s green time; EB/WB phase will have 21 s green time; WB lag phase will have 10 s green time; NB/SB phase will have 62 s green time; [each phase will have 3 s amber and 2 s all red time].	Mitigation not required.	Modify Signal Timing: Shift 1 s of green time from NB/SB phase to WB phase [NB/SB green time shifts from 51 s to 50 s; WB green time shifts from 29 s to 30 s]. Unmitigatable impact. Install an actuated controller. Modify signal phasing and timing plan: EB lead phase will have 7 s green time; EB/WB phase will have 21 s green time; WB lag phase will have 15 s green time; NB/SB phase will have 57 s green time; [each phase will have 3 s amber and 2 s all red time].
Boat Basin Road at Stadium Road				
UNISIGNALIZED INTERSECTIONS				
Boat Basin Road at World's Fair Marina	Install traffic signal with the following timing plan: EB will have 10 s green time; WB - NB-Right will have 40 s green time; NB will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Strip WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane. Strip NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 10 s green time; WB + NB-Right will have 40 s green time; NB will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Strip WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane. Strip NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 10 s green time; WB + NB-Right will have 40 s green time; NB will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Strip WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane. Strip NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 10 s green time; WB + NB-Right will have 40 s green time; NB will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Strip WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane. Strip NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane. Intersection meets NYCDOT Signal Warrant Criteria.
Willets Point Boulevard at Northern Boulevard	Channelize EB through receiving and NB right-turn receiving to allow concurrent traffic flow. Install traffic signal with the following timing plan: EB will have 25 s green time; NB/SB will have 55 s green time [each phase will have 3 s amber and 2 s all red time]. Intersection meets NYCDOT Signal Warrant Criteria.	Channelize EB through receiving and NB right-turn receiving to allow concurrent traffic flow. Install traffic signal with the following timing plan: EB will have 25 s green time; NB/SB will have 55 s green time [each phase will have 3 s amber and 2 s all red time]. Intersection meets NYCDOT Signal Warrant Criteria.	Channelize EB through receiving and NB right-turn receiving to allow concurrent traffic flow. Install traffic signal with the following timing plan: EB will have 25 s green time; NB/SB will have 55 s green time [each phase will have 3 s amber and 2 s all red time]. Intersection meets NYCDOT Signal Warrant Criteria.	Channelize EB through receiving and NB right-turn receiving to allow concurrent traffic flow. Install traffic signal with the following timing plan: EB will have 25 s green time; NB/SB will have 55 s green time [each phase will have 3 s amber and 2 s all red time]. Intersection meets NYCDOT Signal Warrant Criteria.
Grand Central Parkway Ramp at West Park Loop/Stadium Road	Mitigation not required. Install traffic signal with the following timing plan: EB will have 45 s green time; WB will have 25 s green time; NB/SB will have 35 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Strip the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 45 s green time; WB will have 25 s green time; NB/SB will have 35 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Strip the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 40 s green time; WB will have 25 s green time; NB/SB will have 40 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Strip the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 40 s green time; WB will have 25 s green time; NB/SB will have 40 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Strip the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. Intersection meets NYCDOT Signal Warrant Criteria.
126th Street at 36th Avenue	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria. Restrict the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria. Restrict the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria. Restrict the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria. Restrict the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.
126th Street at 37th Avenue	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria. Restrict the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria. Restrict the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria. Restrict the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria. Restrict the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.
Northern Boulevard at 126th Place	Mitigation not required. Restrict the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crossover across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Restrict the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crossover across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Restrict the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crossover across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Restrict the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crossover across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.
NEW (WITH ACTION) SIGNALIZED INTERSECTION				
126th Street at New Willets Point Boulevard	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria.

NOTE: This table has been revised for the Final SEIS.

	-	-	-	-	-	0.43	16.7	B							

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

	-	-	-	-	-	0.79	23.5	C						

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

-Mitigation not required.
-Intersection meets NYCDOT Signal Warrant Criteria.

Overall Intersection		-	-	-	-	0.84	25.1	C						

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

-Mitigation not required.
-Intersection meets NYCDOT Signal Warrant Criteria.

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

TABLE 15

2028 (PHASE 1B) SUMMARY OF GAMEDAY MITIGATION MEASURES

114th Street at Roosevelt Avenue	<p>Shift center line of WB Roosevelt Avenue approach 11 ft to the south.</p> <p>Restripe the WB Roosevelt Avenue approach from two 11-ft travel lanes to one 11-ft exclusive left-turn lane, one 11-ft through lane, and one 11-ft exclusive right-turn lane.</p> <p>Restripe the EB Roosevelt Avenue approach from two 11-ft travel lanes to one 11-ft exclusive left-turn lane and one 11-ft travel lane.</p> <p>Shift centerline of NB 114th Street approach 3 ft to the east.</p> <p>Restripe the NB 114th Street approach from one 16-ft travel lane to one 13-ft travel lane</p> <p>Shift center line of SB 114th Street approach 2 ft to the east.</p> <p>Install "No Standing Anytime" regulations along the east curb of the NB 114th Street approach 250 ft from the intersection.</p> <p>Install "No Standing Anytime" regulations along the south curb of the EB Roosevelt Avenue approach 250 ft from the intersection.</p> <p>Modify signal timing: Shift 2 s green time from EB/WB phase to NB/SB phase [EB/WB green time shifts from 80 s to 78 s; NB/SB green time shifts from 30 s to 32 s].</p> <p>Install "No Standing 3 PM - 7 PM" regulations along the west curb of the SB 114th Street approach 150-ft from the intersection to allow for one 12-ft left-through lane and one 10-ft right-turn lane.</p>	<p>Shift center line of WB Roosevelt Avenue approach 11 ft to the south.</p> <p>Restripe the WB Roosevelt Avenue approach from two 11-ft travel lanes to one 11-ft exclusive left-turn lane, one 11-ft through lane, and one 11-ft exclusive right-turn lane.</p> <p>Restripe the EB Roosevelt Avenue approach from two 11-ft travel lanes to one 11-ft exclusive left-turn lane and one 11-ft travel lane.</p> <p>Shift centerline of NB 114th Street approach 3 ft to the east.</p> <p>Restripe the NB 114th Street approach from one 16-ft travel lane to one 13-ft travel lane</p> <p>Shift center line of SB 114th Street approach 2 ft to the east.</p> <p>Install "No Standing Anytime" regulations along the east curb of the NB 114th Street approach 250 ft from the intersection.</p> <p>Install "No Standing Anytime" regulations along the south curb of the EB Roosevelt Avenue approach 250 ft from the intersection.</p> <p>Modify signal timing: Shift 4 s green time from EB/WB phase to NB/SB phase [EB/WB green time shifts from 80 s to 76 s; NB/SB green time shifts from 30 s to 34 s].</p> <p>Install "No Standing 3 PM - 7 PM" regulations along the west curb of the SB 114th Street approach 150-ft from the intersection to allow for one 12-ft left-through lane and one 10-ft right-turn lane.</p>	<p>Partially mitigated.</p> <p>Shift center line of WB Roosevelt Avenue approach 11 ft to the south.</p> <p>Restripe the WB Roosevelt Avenue approach from two 11-ft travel lanes to one 11-ft exclusive left-turn lane, one 11-ft through lane, and one 11-ft exclusive right-turn lane.</p> <p>Restripe the EB Roosevelt Avenue approach from two 11-ft travel lanes to one 11-ft exclusive left-turn lane and one 11-ft travel lane.</p> <p>Shift centerline of NB 114th Street approach 3 ft to the east.</p> <p>Restripe the NB 114th Street approach from one 16-ft travel lane to one 13-ft travel lane</p> <p>Shift center line of SB 114th Street approach 2 ft to the east.</p> <p>Install "No Standing Anytime" regulations along the east curb of the NB 114th Street approach 250 ft from the intersection.</p> <p>Install "No Standing Anytime" regulations along the south curb of the EB Roosevelt Avenue approach 250 ft from the intersection.</p> <p>Modify signal timing: Shift 4 s green time from EB/WB phase to NB/SB phase [EB/WB green time shifts from 80 s to 76 s; NB/SB green time shifts from 30 s to 34 s].</p>
126th Street at Roosevelt Avenue	<p>Partially Mitigated.</p> <p>Restripe NB approach from one wide 25-ft lane to two 12-ft wide lanes with a 1-ft buffer at the eas curb.</p> <p>Place cones on SB approach to allow for one 12-ft right-turn lane and one 12-ft shared left-through lane during the pre-game peak hour.</p> <p>Traffic Enforcement Agent should be present to operate the signal.</p> <p>Modify signal phasing (to be followed by Traffic Enforcement Agent): EB + SB right-turn lead phase will have 11 s green time; EB/WB phase will have 69 s green time; NB/SB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time].</p>	<p>Partially Mitigated.</p> <p>Restripe NB approach from one wide 25-ft lane to two 12-ft wide lanes with a 1-ft buffer at the east curb.</p> <p>Place cones on SB approach to allow for one 12-ft right-turn lane and one 12-ft shared left-through lane during the pre-game peak hour.</p> <p>Traffic Enforcement Agent should be present to operate the signal.</p> <p>Modify signal phasing (to be followed by Traffic Enforcement Agent): EB + SB right-turn lead phase will have 16 s green time; EB/WB phase will have 64 s green time; NB/SB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time].</p>	<p>Partially Mitigated.</p> <p>Restripe NB approach from one wide 25-ft lane to two 12-ft wide lanes with a 1-ft buffer at the east curb.</p> <p>Place cones on EB approach to allow for one left-turn lane and one shared through-right lane during the post-game peak hour.</p> <p>Traffic Enforcement Agent should be present to operate the signal.</p> <p>Modify signal phasing (to be followed by Traffic Enforcement Agent): EB lead phase will have 19 s green time; EB/WB phase will have 52 s green time; NB/SB phase will have 34 s green time [each phase will have 3 s amber and 2 s all red time].</p>
College Point Boulevard at Roosevelt Avenue	<p>Partially Mitigated.</p> <p>Restripe the WB Roosevelt Avenue approach from one 13-ft travel lane and one 17-ft travel lane to two 15-ft travel lanes.</p> <p>Restripe the EB Roosevelt Avenue approach from one 14-ft travel lane and one 12-ft travel lane to two 13-ft travel lanes.</p> <p>Restripe the NB College Point Boulevard approach from one 9-ft exclusive left-turn lane, one 13-ft travel lane, and one 18-ft travel lane with parking to two 10-ft exclusive left-turn lanes, and two 10-ft travel lanes for 200 ft.</p> <p>Restripe the SB College Point Boulevard approach from one 11-ft travel lane and one 19-ft travel lane to three 10-ft travel lanes for 200 ft.</p> <p>Restripe the NB/SB lanes in the Roosevelt Avenue median from one NB 24-ft travel lane, one NB 11-ft travel lane, one NB 10-ft exclusive left-turn lane, one SB 10-ft travel lane and one SB 20-ft travel lane to one NB 15-ft travel lane, one NB 10-ft travel lane, two NB 10-ft exclusive left-turn lanes, and three SB 10-ft travel lanes.</p> <p>Extend median on the north leg 3 ft to the east and shift NB receiving lanes 3 ft to the east. Boat Basin Road at Stadium Road	<p>Partially Mitigated.</p> <p>Install an actuated controller.</p> <p>Modify signal phasing and timing plan: EB lead phase will have 7 s green time; EB/WB phase will have 21 s green time; WB lag phase will have 13 s green time; NB/SB phase will have 59 s green time; [each phase will have 3 s amber and 2 s all red time].</p>	<p>Unmitigatable impact.</p> <p>Install an actuated controller.</p> <p>Modify signal phasing and timing plan: EB lead phase will have 7 s green time; EB/WB phase will have 21 s green time; WB lag phase will have 12 s green time; NB/SB phase will have 60 s green time; [each phase will have 3 s amber and 2 s all red time].</p>	<p>Install an actuated controller.</p> <p>Modify signal phasing and timing plan: EB lead phase will have 22 s green time; EB/WB phase will have 25 s green time; WB lag phase will have 11 s green time; NB/SB phase will have 42 s green time; [each phase will have 3 s amber and 2 s all red time].</p>
UNSIGNALIZED INTERSECTIONS			
Boat Basin Road at Worlds Fair Marina	<p>Install traffic signal with the following timing plan: EB will have 10 s green time; WB + NB-Right will have 45 s green time; NB will have 20 s green time [each phase will have 3 s amber and 2 s all red time].</p> <p>Stripe WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane.</p> <p>Stripe NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane.</p> <p>Intersection meets NYCDOT Signal Warrant Criteria.</p>	<p>Install traffic signal with the following timing plan: EB will have 10 s green time; WB + NB-Right will have 45 s green time; NB will have 20 s green time [each phase will have 3 s amber and 2 s all red time].</p> <p>Stripe WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane.</p> <p>Stripe NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane.</p> <p>Intersection meets NYCDOT Signal Warrant Criteria.</p>	<p>Install traffic signal with the following timing plan: EB will have 10 s green time; WB + NB-Right will have 45 s green time; NB will have 20 s green time [each phase will have 3 s amber and 2 s all red time].</p> <p>Stripe WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane.</p> <p>Stripe NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane.</p> <p>Intersection meets NYCDOT Signal Warrant Criteria.</p>

TABLE 15

2028 (PHASE 1B) SUMMARY OF GAMEDAY MITIGATION MEASURES

Willels Point Boulevard at Northern Boulevard	Channelize EB through receiving and NB right-turn receiving to allow concurrent traffic flow. Install traffic signal with the following timing plan: EB will have 25 s green time; NB/SB will have 55 s green time [each phase will have 3 s amber and 2 s all red time]. Intersection meets NYCDOT Signal Warrant Criteria.	Channelize EB through receiving and NB right-turn receiving to allow concurrent traffic flow. Install traffic signal with the following timing plan: EB will have 25 s green time; NB/SB will have 55 s green time [each phase will have 3 s amber and 2 s all red time]. Intersection meets NYCDOT Signal Warrant Criteria.	Channelize EB through receiving and NB right-turn receiving to allow concurrent traffic flow. Install traffic signal with the following timing plan: EB will have 25 s green time; NB/SB will have 55 s green time [each phase will have 3 s amber and 2 s all red time]. Intersection meets NYCDOT Signal Warrant Criteria.
Grand Central Parkway Ramp at West Park Loop/Stadium Road	Install traffic signal with the following timing plan: EB will have 40 s green time; WB will have 25 s green time; NB/SB will have 40 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Stripe the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 40 s green time; WB will have 25 s green time; NB/SB will have 40 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Stripe the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 30 s green time; WB will have 25 s green time; NB/SB will have 50 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Stripe the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. Intersection meets NYCDOT Signal Warrant Criteria.
126th Street at 36th Avenue	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Partially mitigated. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.
126th Street at 37th Avenue	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Partially mitigated. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.
Northern Boulevard at 126th Place	Mitigation not required. Restripe the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crosswalk across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Restripe the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crosswalk across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Restripe the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crosswalk across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.
NEW (WITH ACTION) SIGNALIZED INTERSECTION			
126th Street at New Willels Point Boulevard	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Intersection meets NYCDOT Signal Warrant Criteria.

NOTE: This table has been revised for the Final SEIS.

		-	-	-	-	R	0.37	27.4	C			
Overall Intersection		-	-	-	-	-	0.67	21.4	C			

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

-Mitigation not required.
-Intersection meets NYCDOT Signal Warrant Criteria.

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Overall Intersection		-	-	-	-	-	1.02	35.6	D						

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

-Mitigation not required.
-Intersection meets NYCDOT Signal Warrant Criteria.

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

TABLE 24

2032 (PHASE 2) GAMEDAY MITIGATION MEASURES			
INTERSECTION SIGNALIZED INTERSECTIONS	WEEKDAY PRE-GAME PEAK HOUR	SATURDAY PRE-GAME PEAK HOUR	SATURDAY POST-GAME PEAK HOUR
108th Street at Astoria Boulevard	Unmitigatable impact.	Install "No Standing 3 PM - 10 PM Saturday" regulations along the south curb of the EB approach for 150-ft from the intersection to allow for an 11-ft daylighted right-turn lane. Modify signal timing: shift 1 s of green time from EB/WB phase to WB lead phase [EB/WB green time shifts from 34 s to 33 s; WB lead green time shifts from 9 s to 10 s].	Install "No Standing 3 PM - 10 PM Saturday" regulations along the south curb of the EB approach for 150-ft from the intersection to allow for an 11-ft daylighted right-turn lane. Modify signal timing: shift 1 s of green time from EB/WB phase to WB lead phase [EB/WB green time shifts from 34 s to 33 s; WB lead green time shifts from 9 s to 10 s].
108th Street at Northern Boulevard (RT. 25A)	Install "No Standing Anytime" regulations along the east curb of the NB approach for 250-ft from the intersection to allow for two moving lanes. Install "No Standing Anytime" regulations along the west curb of the SB approach for 250-ft from the intersection to allow for two moving lanes. Restripe NB approach of 108th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restripe SB approach of 108th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Install "No Standing 10 AM - 9 PM" regulations along the north curb of the WB approach for 150-ft from the intersection to allow for a 10-ft daylighted right-turn lane. Install "No Standing 10 AM - 9 PM" regulations along the south curb of the EB approach for 100-ft from the intersection to allow for a 10-ft daylighted right-turn lane.	Install "No Standing Anytime" regulations along the east curb of the NB approach for 250-ft from the intersection to allow for two moving lanes. Install "No Standing Anytime" regulations along the west curb of the SB approach for 250-ft from the intersection to allow for two moving lanes. Restripe NB approach of 108th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restripe SB approach of 108th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Modify signal timing: shift 1 s of green time from NB/SB phase to EB/WB left-turn phase and shift 2 s green time from NB/SB phase to EB/WB phase [NB/SB green time shifts from 30 s to 27 s; EB/WB left-turn green time shifts from 9 s to 10 s; EB/WB green time shifts from 66 s to 68 s]. Install "No Standing 10 AM - 9 PM" regulations along the north curb of the WB approach for 150-ft from the intersection to allow for a 10-ft daylighted right-turn lane. Install "No Standing 10 AM - 9 PM" regulations along the south curb of the EB approach for 100-ft from the intersection to allow for a 10-ft daylighted right-turn lane.	Install "No Standing Anytime" regulations along the east curb of the NB approach for 250-ft from the intersection to allow for two moving lanes. Install "No Standing Anytime" regulations along the west curb of the SB approach for 250-ft from the intersection to allow for two moving lanes. Restripe NB approach of 108th Street from one 22-ft lane to one 11-ft exclusive left-turn lane and one 11-ft shared through-right lane for 175 ft. Restripe SB approach of 108th Street from one 23-ft lane to one 11-ft exclusive left-turn lane and one 12-ft shared through-right lane for 175 ft. Modify signal timing: shift 1 s of green time from NB/SB phase to EB/WB left-turn phase and shift 2 s green time from NB/SB phase to EB/WB phase [NB/SB green time shifts from 30 s to 27 s; EB/WB left-turn green time shifts from 9 s to 10 s; EB/WB green time shifts from 66 s to 68 s]. Install "No Standing 10 AM - 9 PM" regulations along the north curb of the WB approach for 150-ft from the intersection to allow for a 10-ft daylighted right-turn lane. Install "No Standing 10 AM - 9 PM" regulations along the south curb of the EB approach for 100-ft from the intersection to allow for a 10-ft daylighted right-turn lane.
114th Street at Northern Boulevard (RT. 25A)	Prohibit left-turns from WB Northern Boulevard onto SB 114th Street to allow for three exclusive through lanes. Divert left-turning turning to NB 112th Place and then to SB 114th Street. Prohibit parking along east curb of SB 114th Street for 200 ft and restripe as two 11-ft moving lanes. Restripe SB 114th Street receiving lanes as two 11-ft moving lanes with parking on both sides. Modify signal timing: Eliminate WB lead phase. Shift 12 s green time from WB lead phase to SB phase [SB green time shifts from 23 s to 35 s]. Shift 10 s green time from WB lead phase to EB/WB phase [EB/WB green time shifts from 65 s to 75 s].	Prohibit left-turns from WB Northern Boulevard onto SB 114th Street to allow for three exclusive through lanes. Divert left-turning turning to NB 112th Place and then to SB 114th Street. Prohibit parking along east curb of SB 114th Street for 200 ft and restripe as two 11-ft moving lanes. Restripe SB 114th Street receiving lanes as two 11-ft moving lanes with parking on both sides. Modify signal timing: Eliminate WB lead phase. Shift 10 s green time from WB lead phase to SB phase [SB green time shifts from 25 s to 35 s]. Shift 12 s green time from WB lead phase to EB/WB phase [EB/WB green time shifts from 63 s to 75 s].	Partially mitigated. Prohibit left-turns from WB Northern Boulevard onto SB 114th Street to allow for three exclusive through lanes. Divert left-turning turning to NB 112th Place and then to SB 114th Street. Prohibit parking along east curb of SB 114th Street for 200 ft and restripe as two 11-ft moving lanes. Restripe SB 114th Street receiving lanes as two 11-ft moving lanes with parking on both sides. Modify signal timing: Eliminate WB lead phase. Shift 10 s green time from WB lead phase to SB phase [SB green time shifts from 25 s to 35 s]. Shift 12 s green time from WB lead phase to EB/WB phase [EB/WB green time shifts from 63 s to 75 s].
126th Street at Northern Boulevard (RT. 25A)	Unmitigated Impact Install quick-curb on WB approach between the right-most lane and center lane to allow the Van Wyck and Whitestone Expressway Ramp to bypass the signal and operate as free flow through the intersection. Close the ramp from EB Northern Blvd ramp to 126th Street. Divert traffic from the closed ramp through the intersection to SB 126th Pl to 34th Ave. Widen the EB Northern approach from two 12-ft lanes to three 10-ft lanes. Prohibit pedestrian crossing in the east crosswalk and divert pedestrians to the new crossing at 126th Place at Northern Boulevard. Modify signal timing: shift 4 s of green time from EB GCP/Astoria Blvd Ramp phase to EB Northern Blvd phase [EB Northern Blvd green time shifts from 25 s to 29 s; EB GCP/Astoria Blvd Ramp green time shifts from 55 s to 51 s].	Unmitigated Impact Install quick-curb on WB approach between the right-most lane and center lane to allow the Van Wyck and Whitestone Expressway Ramp to bypass the signal and operate as free flow through the intersection. Close the ramp from EB Northern Blvd ramp to 126th Street. Divert traffic from the closed ramp through the intersection to SB 126th Pl to 34th Ave. Widen the EB Northern approach from two 12-ft lanes to three 10-ft lanes. Prohibit pedestrian crossing in the east crosswalk and divert pedestrians to the new crossing at 126th Place at Northern Boulevard. Modify signal timing: shift 3 s of green time from EB GCP/Astoria Blvd Ramp phase to EB Northern Blvd phase [EB GCP/Astoria Blvd Ramp green time shifts from 45 s to 42 s; EB Northern Blvd green time shifts from 35 s to 38 s].	Partially mitigated. Install Jersey barriers on WB approach between the right-most lane and center lane to allow the Van Wyck and Whitestone Expressway Ramp to bypass the signal and operate as free flow through the intersection. Close the ramp from EB Northern Blvd ramp to 126th Street. Divert traffic from the closed ramp through the intersection to SB 126th Pl to 34th Ave. Widen the EB Northern approach from two 12-ft lanes to three 10-ft lanes. Prohibit pedestrian crossing in the east crosswalk and divert pedestrians to the new crossing at 126th Place at Northern Boulevard. Modify signal timing: shift 1 s of green time from EB Northern Blvd phase to NB 126th St phase [EB Northern Blvd green time shifts from 35 s to 34 s; NB 126th St green time shifts from 25 s to 26 s].
Prince Street at Northern Boulevard (RT. 25A)	Partially Mitigated. Install "No Standing 10 AM - 7 PM" regulations along the north curb of the WB Northern Boulevard Service Road approach for 100-ft from the intersection to allow for one 10-ft through lane and one 10-ft daylighted right-turn pocket. Reduce the width of the hatched median between the Service Road and Mainline from 8-ft to 6-ft.	Partially Mitigated. Install "No Standing 10 AM - 7 PM" regulations along the north curb of the WB Northern Boulevard Service Road approach for 100-ft from the intersection to allow for one 10-ft through lane and one 10-ft daylighted right-turn pocket. Reduce the width of the hatched median between the Service Road and Mainline from 8-ft to 6-ft.	Unmitigatable Impact.
Main Street at Northern Boulevard (RT. 25A)	Unmitigatable impact.	Unmitigatable impact.	Unmitigatable impact.
Union Street at Northern Boulevard (RT. 25A)	Partially Mitigated. Install "No Standing 7AM - 10PM" regulations along the north curb of the WB Northern Blvd approach 200-ft from the intersection to allow for one 10-ft daylighted shared through-right lane.	Partially Mitigated. Install "No Standing 7AM - 10PM" regulations along the north curb of the WB Northern Blvd approach 200-ft from the intersection to allow for one 10-ft daylighted shared through-right lane.	Partially Mitigated. Install "No Standing 7AM - 10PM" regulations along the north curb of the WB Northern Blvd approach 200-ft from the intersection to allow for one 10-ft daylighted shared through-right lane. Modify Signal Timing: Shift 1 s of green time from NB/SB phase to EB/WB left-turn phase [NB/SB green time shifts from 44 s to 43 s; EB/WB left-turn green time shifts from 15 s to 16 s].
Parsons Boulevard at Northern Boulevard (RT. 25A)	Partially Mitigated. Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 1 s of green time from EB/WB protected left-turn phase to EB/WB phase; shift 1 s green time from LPI phase (east and west crosswalks) to NB/SB phase [EB/WB protected left-turn green time shifts from 12 s to 11 s; EB/WB green time shifts from 50 s to 51 s; LPI shifts from 7 s to 6 s; NB/SB green time shifts from 36 s to 37 s].	Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 1 s green time from EB/WB protected left-turn phase to EB/WB phase [EB/WB protected left-turn green time shifts from 10 s to 9 s; EB/WB green time shifts from 52 s to 53 s].	Install "No Standing Anytime" regulations along the north curb of the WB Northern Blvd approach 150-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the south curb of the EB Northern Blvd approach 200-ft from the intersection to allow for one 10-ft daylighted right-turn lane. Install "No Standing Anytime" regulations along the west curb of the SB Parsons Blvd approach 150 ft from the intersection to allow for one 10-ft daylighted right-turn lane. Modify Signal Timing: Shift 1 s green time from EB/WB protected left-turn phase to EB/WB phase [EB/WB protected left-turn green time shifts from 10 s to 9 s; EB/WB green time shifts from 52 s to 53 s].
114th Street at 34th Avenue	Modify Signal Timing: Shift 3 s of green time from EB phase to SB phase [EB green time shifts from 52 s to 49 s; SB green time shifts from 28 s to 31 s].	Modify Signal Timing: Shift 3 s of green time from EB phase to SB phase [EB green time shifts from 52 s to 49 s; SB green time shifts from 28 s to 31 s].	Modify Signal Timing: Shift 3 s of green time from EB phase to SB phase [EB green time shifts from 52 s to 49 s; SB green time shifts from 28 s to 31 s].
126th Street/GCP Ramp at 34th Avenue	Partially mitigated. Restripe the NB 126th Street approach from two 11-ft travel lanes, one 12-ft travel lane, and one 7-ft hatched median to one 12-ft exclusive left-turn lane, two 12-ft travel lanes and one 5-ft Class II bicycle lane. Widen roadway on the east leg of the intersection to 44 ft to have two 11-ft WB approach lanes and two 11-ft EB receiving lanes. Close the ramp from EB Northern Blvd ramp to 126th Street. Construct a channelized right-turn from the GCP/EB Astoria Blvd ramp to WB Shea Road. Reconstruct the GCP/EB Astoria Blvd ramp to have one 11-ft exclusive left-turn lane and two 11-ft travel lanes. Modify signal phasing and timing plan: EB/WB phase will have 53 s green time; NB/SB lead left-turn phase will have 12 s green time; NB/SB phase will have 38 s green time [each phase will have 3 s amber and 2 s all red time].	Partially mitigated. Restripe the NB 126th Street approach from two 11-ft travel lanes, one 12-ft travel lane, and one 7-ft hatched median to one 12-ft exclusive left-turn lane, two 12-ft travel lanes and one 5-ft Class II bicycle lane. Widen roadway on the east leg of the intersection to 44 ft to have two 11-ft WB approach lanes and two 11-ft EB receiving lanes. Close the ramp from EB Northern Blvd ramp to 126th Street. Construct a channelized right-turn from the GCP/EB Astoria Blvd ramp to WB Shea Road. Reconstruct the GCP/EB Astoria Blvd ramp to have one 11-ft exclusive left-turn lane and two 11-ft travel lanes. Modify signal phasing and timing plan: EB/WB phase will have 53 s green time; NB/SB lead left-turn phase will have 11 s green time; NB/SB phase will have 41 s green time [each phase will have 3 s amber and 2 s all red time].	Partially mitigated. Restripe the NB 126th Street approach from two 11-ft travel lanes, one 12-ft travel lane, and one 7-ft hatched median to one 12-ft exclusive left-turn lane, two 12-ft travel lanes and one 5-ft Class II bicycle lane. Widen roadway on the east leg of the intersection to 44 ft to have two 11-ft WB approach lanes and two 11-ft EB receiving lanes. Close the ramp from EB Northern Blvd ramp to 126th Street. Construct a channelized right-turn from the GCP/EB Astoria Blvd ramp to WB Shea Road. Reconstruct the GCP/EB Astoria Blvd ramp to have one 11-ft exclusive left-turn lane and two 11-ft travel lanes. Modify signal phasing and timing plan: EB/WB phase will have 48 s green time; NB/SB lead left-turn phase will have 7 s green time; NB/SB phase will have 50 s green time [each phase will have 3 s amber and 2 s all red time].

TABLE 24

2032 (PHASE 2) GAMEDAY MITIGATION MEASURES

TABLE 24

2032 (PHASE 2) GAMEDAY MITIGATION MEASURES

Parsons Boulevard at Sanford Avenue	Shift NB centerline 1-ft to the west to allow for a 20-ft NB approach. Install "No Standing Anytime" regulations on the NB approach 75-ft from the stopbar to allow for one 10-ft left-through lane and one 10-ft daylighted right-turn pocket. Install "No Standing 10 AM - 9 PM" regulations on the SB approach 75 feet from the stop bar to allow for a 10-ft daylighted right-turn lane.	Shift NB centerline 1-ft to the west to allow for a 20-ft NB approach. Install "No Standing Anytime" regulations on the NB approach 75-ft from the stopbar to allow for one 10-ft left-through lane and one 10-ft daylighted right-turn pocket. Install "No Standing 10 AM - 9 PM" regulations on the SB approach 75 feet from the stop bar to allow for a 10-ft daylighted right-turn lane.	Shift NB centerline 1-ft to the west to allow for a 20-ft NB approach. Install "No Standing Anytime" regulations on the NB approach 75-ft from the stopbar to allow for one 10-ft left-through lane and one 10-ft daylighted right-turn pocket. Install "No Standing 10 AM - 9 PM" regulations on the SB approach 75 feet from the stop bar to allow for a 10-ft daylighted right-turn lane.
College Point Boulevard at 32nd Avenue	Mitigation not required.	Mitigation not required.	Mitigation not required.
College Point Boulevard at Northern Boulevard Service Road	Modify Signal Timing: Shift 3 s of green time from NB/SB phase to WB phase [NB/SB green time shifts from 51 s to 48 s; WB green time shifts from 29 s to 32 s].	Unmitigatable impact.	Mitigation not required.
Boat Basin Road at Stadium Road	Partially Mitigated. Install an actuated controller. Modify signal phasing and timing plan: EB lead phase will have 7 s green time; EB/WB phase will have 24 s green time; WB lag phase will have 9 s green time; NB/SB phase will have 45 s green time; SB lag phase will have 10 s green time [each phase will have 3 s amber and 2 s all red time].	Partially Mitigated. Install an actuated controller. Modify signal phasing and timing plan: EB lead phase will have 7 s green time; EB/WB phase will have 34 s green time; WB lag phase will have 7 s green time; NB/SB phase will have 31 s green time; SB lag phase will have 16 s green time [each phase will have 3 s amber and 2 s all red time].	Unmitigatable impact. Install an actuated controller. Modify signal phasing and timing plan: EB lead phase will have 14 s green time; EB/WB phase will have 37 s green time; WB lag phase will have 7 s green time; NB/SB phase will have 29 s green time; SB lag phase will have 8 s green time [each phase will have 3 s amber and 2 s all red time].
UNSIGNALIZED INTERSECTIONS			
Boat Basin Road at Worlds Fair Marina	Install traffic signal with the following timing plan: EB will have 7 s green time; WB + NB-Right will have 50 s green time; NB will have 18 s green time [each phase will have 3 s amber and 2 s all red time]. Stripe WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane. Stripe NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 7 s green time; WB + NB-Right will have 50 s green time; NB will have 18 s green time [each phase will have 3 s amber and 2 s all red time]. Stripe WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane. Stripe NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 7 s green time; WB + NB-Right will have 50 s green time; NB will have 18 s green time [each phase will have 3 s amber and 2 s all red time]. Stripe WB approach as one 11-ft left-turn lane and one 11-ft shared left-through lane. Stripe NB approach as two 10-ft left-turn lanes and one 10-ft right-turn lane. Intersection meets NYCDOT Signal Warrant Criteria.
Willets Point Boulevard at Northern Boulevard	Channelize EB through receiving and NB right-turn receiving to allow concurrent traffic flow. Install traffic signal with the following timing plan: EB/NB right-turn will have 25 s green time; NB/SB will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Intersection meets NYCDOT Signal Warrant Criteria.	Channelize EB through receiving and NB right-turn receiving to allow concurrent traffic flow. Install traffic signal with the following timing plan: EB/NB right-turn will have 25 s green time; NB/SB will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Intersection meets NYCDOT Signal Warrant Criteria.	Channelize EB through receiving and NB right-turn receiving to allow concurrent traffic flow. Install traffic signal with the following timing plan: EB/NB right-turn will have 30 s green time; NB/SB will have 20 s green time [each phase will have 3 s amber and 2 s all red time]. Intersection meets NYCDOT Signal Warrant Criteria.
Grand Central Parkway Ramp at West Park Loop/Stadium Road	Install traffic signal with the following timing plan: EB will have 35 s green time; WB will have 20 s green time; NB/SB will have 50 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Stripe the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 45 s green time; WB will have 20 s green time; NB/SB will have 40 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Stripe the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. Intersection meets NYCDOT Signal Warrant Criteria.	Install traffic signal with the following timing plan: EB will have 35 s green time; WB will have 20 s green time; NB/SB will have 50 s green time [each phase will have 3 s amber and 2 s all red time]. Add a right turn lane and channelized right-turn to the GCP off ramp. Stripe the WB approach as two 12-ft left-turn lanes and one 12-ft right-turn lane. Add a 12-ft SB left-turn lane in the median of Stadium Road. Intersection meets NYCDOT Signal Warrant Criteria.
126th Street at 36th Avenue	Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Unmitigatable impact. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Unmitigatable impact. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.
126th Street at 37th Avenue	Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Unmitigatable impact. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.	Unmitigatable impact. Intersection meets NYCDOT Signal Warrant Criteria. Restripe the WB approach as one 10-ft left-turn lane and one 10-ft right-turn lane.
Northern Boulevard at 126th Place	Restripe the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crosswalk across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Restripe the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crosswalk across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.	Mitigation not required. Restripe the NB approach as one 12-ft right-turn lane and two 10-ft receiving lanes. Install traffic signal with the following timing plan: EB phase will have 85 s green time; NB phase will have 25 s green time [each phase will have 3 s amber and 2 s all red time]. Install a crosswalk across the EB Northern Blvd approach to allow pedestrian access to a new bus stop in the WB Northern Blvd median. Intersection meets NYCDOT Signal Warrant Criteria.
NEW (WITH ACTION) SIGNALIZED INTERSECTIONS			
126th Street at New Willets Point Boulevard	Mitigation not required.	Mitigation not required.	Mitigation not required.
Citi Field/Lot B at Roosevelt Avenue	Mitigation not required.	Mitigation not required.	Mitigation not required.

NOTE: This table has been revised for the Final SEIS.

TABLE 25
CITIFIELD - WILLETS POINT DEVELOPMENT STUDY

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Overall Intersection		-	-	-	-	-	0.77	42.2	D					

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

A. INTRODUCTION

Consistent with City Environmental Quality Review (CEQR) requirements, this chapter of this Supplemental Environmental Impact Statement (SEIS) examines alternatives to the proposed project, which is a modification to the previously approved Willets Point Development Plan.

CEQR requires the examination of a No Action Alternative, in which a proposed project would not be undertaken. CEQR also recommends the examination of alternatives that would have no unmitigated significant adverse impacts, if unmitigated significant adverse impacts are predicted for a proposed project. Therefore, the alternatives examined in this chapter are the No Action Alternative and the No Unmitigated Significant Impacts Alternative. As described in detail below in Section B, “Summary of Findings—2008 FGEIS and Subsequent Technical Memoranda,” the other alternatives evaluated in the 2008 FGEIS are not being considered in this analysis.

This analysis first examines the No Action Alternative, which describes the conditions that would exist if the proposed project were not implemented. The second alternative examined below is the No Unmitigated Significant Impacts Alternative, which examines the level of development that would be necessary to avoid all the potential unmitigated impacts associated with the proposed project.

PRINCIPAL CONCLUSIONS

NO ACTION ALTERNATIVE

The No Action Alternative assumes the continuation of existing uses on the various portions of the project site. Since this alternative would allow the continued industrial use of the District, it would not allow for development of affordable housing, community facilities, schools, and public open space. It also would not comprehensively remediate contaminated soils and groundwater, nor provide new sanitary and storm sewers; as a result, there would continue to be degraded water quality and potential impacts to aquatic biota through the continued discharge of wastewater, polluted storm water, and sediments from the District to the Flushing River, Flushing Bay, and groundwater aquifers. Because the No Action Alternative would not develop new retail and entertainment uses at Willets West and the District, it would not generate the substantial economic and civic benefits resulting from the proposed project in the way of new jobs and tax revenues. Moreover, this alternative would not advance a number of the Downtown Flushing Development Framework’s fundamental goals, including the creation of a regional destination that would enhance economic growth in Downtown Flushing and Corona, improvement of environmental conditions, and integration of new development in the District with surrounding amenities. The former Empire Millwork Corporation Building would remain under private ownership in the No Action Alternative and could be demolished as-of-right; mitigation measures such as photographic documentation would not be required.

NO UNMITIGATED SIGNIFICANT IMPACTS ALTERNATIVE

The No Unmitigated Significant Impacts Alternative explores modifications to the proposed project that would avoid the unmitigated significant impacts to historic and cultural resources, traffic, transit, and pedestrians:

- For historic and cultural resources, this alternative would avoid the demolition of the former Empire Millwork Corporation Building that would occur with Phase 2 of the proposed project. Although this could be achieved through adaptive reuse, exterior elements would still need to be upgraded to comply with building codes and noise attenuation requirements, and flood protection measures such as gates or pumps would be required to comply with flood insurance requirements. Overall, this alternative would reduce the footprint of any new development, which would result in greater density in the remainder of the District, fewer housing units, less open space, or some combination of these possibilities. As noted above, the former Empire Millwork Corporation Building could be demolished as-of-right under existing conditions, and mitigation measures such as photographic documentation would not be required.
- For traffic, the proposed project and the potential future development on Lot B would result in significant adverse impacts that cannot be fully alleviated with practical mitigation measures. Because of existing congestion at a number of intersections, even a minimal increase in traffic would result in unmitigated impacts. Based on a sensitivity analysis of intersections within the study area, it was determined that in all three phases of the proposed project, the addition of five or fewer vehicles through some intersections would trigger an impact that cannot be fully mitigated. Thus, almost any new development at the project site would result in unmitigated traffic impacts, and no reasonable alternative could be developed to avoid such impacts.
- For transit, the proposed project and potential future development on Lot B would result in significant adverse subway line-haul impacts on the Manhattan-bound No.7 subway line express service during the 2028 and 2032 AM peak periods and on station operations at the Mets-Willets Point subway station under the 2018, 2028, and 2032 With Action conditions. Should New York City Transit (NYCT) revert back to its pre-CitiField station operating plan for the Mets-Willets Point subway station, the significant adverse impacts on station operations may potentially be deemed unmitigatable. Although the City had consulted with the New York Metropolitan Transportation Authority (MTA) on extending regular Long Island Rail Road (LIRR) service to Willets Point, which would be expected to provide substantial relief to the No. 7 subway line and may prevent this significant adverse subway impact from materializing, the implementation of the LIRR service improvement would depend on whether the actual future demand shows that such service improvement is warranted. It should be noted that this significant adverse line-haul impact on the No. 7 line would not occur until Phase 2 should NYCT be able to process an additional Manhattan-bound express train during the AM peak hour, as assumed in the Draft SEIS (DSEIS). To avoid this potentially unmitigatable impact, portions or all of Phase 1B and Phase 2 of the proposed project and the potential future development on Lot B would need to be eliminated from the current development plan. Almost any new development at the project site would result in the potentially unmitigatable impact on station operations at the Mets-Willets Point subway station, and no reasonable alternative could be developed to avoid such impacts without substantially compromising the proposed project's stated goals.

- For pedestrians, the proposed project and potential future development on Lot B would result in significant adverse impacts at ~~five-seven~~ study area crosswalks upon Phase 1A completion, five study area crosswalks upon and Phase 1B completion, and seven study area crosswalks upon the Phase 2 full build-out in 2032, respectively in 2018 and 2028, respectively, and at eight study area crosswalks upon the Phase 2 full build out in 2032. No reasonable alternative could be developed to avoid these impacts without substantially compromising the proposed project's stated goals.

B. SUMMARY OF FINDINGS—2008 FGEIS AND SUBSEQUENT TECHNICAL MEMORANDA

The 2008 Final Generic Environmental Impact Statement (FGEIS) examined five alternatives, including:

- A No Action Alternative, which described the conditions that would exist if the 2008 Willets Point Development Plan were not implemented;
- A No Unmitigated Impact Alternative, which examined the level of development that would be necessary to avoid all the potential unmitigated impacts associated with the 2008 Willets Point Development Plan;
- A Flushing Bridge Alternative, which assessed the 2008 Willets Point Development Plan with a new pedestrian bridge connecting the District and Downtown Flushing;
- A Municipal Services Alternative, which evaluated conditions that would have been likely to occur if the District were not rezoned but additional municipal services were provided to the District; and
- A Staged Acquisition Alternative, in which properties in the District would have been acquired and infrastructure developed over time.

The No Action Alternative considered in the FGEIS was intended to avoid some of the adverse environmental impacts of the 2008 Willets Point Development Plan but would not have resulted in the benefits of the 2008 proposed project. The No Unmitigated Impact Alternative considered in the FGEIS explored modifications to the 2008 Willets Point Development Plan that would have mitigated project impacts to historic resources, traffic, pedestrians, and noise. The subsequent Technical Memoranda 3 and 4 considered an Adjusted Plan and an Updated Plan, which, like the Staged Acquisition Alternative, proposed development in stages. As the proposed project assumes a very similar development of the District in stages, a re-evaluation of the Staged Acquisition Alternative is not necessary.

While the 2008 FGEIS concluded that the Flushing Bridge Alternative would improve pedestrian access to the District as well as access to the District's proposed open space, and would help integrate new development in the District with surrounding amenities, this alternative also would require a variety of approvals, including: acquisition of property, an easement, or a lease for right-of-way on state-owned property; approval by the New York State Department of Transportation (NYSDOT) and potentially Federal Highway Administration (FHWA) for construction of new structures above the Van Wyck Expressway ramps; approval by the New York State Department of Environmental Conservation (NYSDEC) and potentially the U.S. Army Corps of Engineers (USACE) for construction above and adjacent to the Flushing River; and approval by the City of New York for acquisition of property, an easement, or a lease of private property within the view corridor of 37th Avenue east of the Flushing River. No

application for such actions has been made, and no funding has been allocated or is planned for allocation to the construction of such a bridge. Therefore, the Flushing Bridge Alternative is not analyzed in this SEIS.

The 2008 FGEIS concluded that the Municipal Services Alternative would not result in the creation of a dynamic, sustainable community that integrates regional attractions and residential, retail, and other uses; would not provide for new affordable housing units, community facilities, or open space within the District; and would not advance a number of the Downtown Flushing Development Framework's fundamental goals, including the creation of a regional destination that would enhance economic growth in Downtown Flushing and Corona, and integration of new development in the District with surrounding amenities. Furthermore, as the municipal improvements that would have taken place under this alternative would have been largely limited to public property, and existing private properties would remain developed with buildings at their current grade, this alternative presented more serious complications with respect to the feasibility of effectively upgrading the area's infrastructure than would redevelopment of the District as would have occurred under the Willets Point Development Plan. The Municipal Services Alternative also would not result in the filling of the District to flood elevation. The Municipal Services Alternative also would not result in comprehensive site remediation of the District, which is one of the goals of the proposed project. No changes to background conditions, differences in elements between the development program analyzed in the 2008 FGEIS and the proposed project, or changes in analysis methodology would alter these conclusions. Therefore, the Municipal Services Alternative is not analyzed in this SEIS.

C. NO ACTION ALTERNATIVE

DESCRIPTION

The No Action Alternative has been discussed as the "future without the proposed project" in the technical chapters of this SEIS. The No Action Alternative assumes that the existing uses within the Special Willets Point District, Willets West, as well as South Lot and Lot D would remain and that the mix of uses would not be developed. The No Action Alternative also assumes that the potential future development on Lot B would not occur. As such, the No Action Alternative would not require the special permit to allow surface parking/open and enclosed privately operated recreation uses within the District, modification of the existing lease for the CitiField and adjacent parking properties, or any revisions to the previously approved City Maps to modify the staging for the closure of City streets. The No Action Alternative would also not result in the remediation of contaminated soils within the District; filling of the District to above flood elevation; or the creation of new streets, sewers, and other public infrastructure within the District.

LAND USE, ZONING, AND PUBLIC POLICY

LAND USE

The No Action Alternative, like the proposed project, would not result in significant adverse impacts on land use, zoning, and public policy. However, neither would it result in the positive effects that the proposed project would provide.

Without the proposed project, it is expected that the District would continue to have the industrial and auto-related uses that are currently there and would continue to be isolated from

surrounding neighborhoods, and that the Willets West and Roosevelt Avenue portions of the project site would continue to serve the parking needs of CitiField. The existing uses in the remainder of the Willets Point peninsula, including the undeveloped MTA property to the east of the District, also are expected to remain unchanged. The substantial amount of new development under construction or planned within the primary and secondary study areas would occur over the long term without the proposed project, following current development projects and alongside other initiatives proposed as part of the 2004 Downtown Flushing Development Framework.

The planning effort being undertaken by the Flushing Willets Corona Local Development Corporation (FWCLDC), in consultation with the New York City Department of City Planning (DCP), with funding from the New York State Department of State (NYSDOS) under the Brownfield Opportunity Areas (BOA) Program would still occur under the No Action Alternative; however, the No Action Alternative would not advance a number of the Downtown Flushing Development Framework's fundamental goals, including facilitating future growth and sustainability of the area through the redevelopment of Willets Point. Furthermore, the environmental remediation that would be undertaken with the proposed project would not occur and would not lead to improved environmental conditions in the District.

ZONING

Under the No Action Alternative, no changes to zoning are anticipated for the project site. Some changes to zoning would occur in study areas, related to the No Build projects identified in Chapter 2, "Land Use, Zoning and Public Policy."

PUBLIC POLICY

Under the No Action Alternative, no new policies are expected that would affect the project site or the primary and secondary study areas. Without the proposed project, an essential component of the Downtown Flushing Development Framework—the redevelopment of the Willets Point peninsula—would not proceed, and many of the Framework's goals, which focus on facilitating future growth and sustainability of the area through the redevelopment of Willets Point, would not be achieved. It is expected that the City would continue to explore opportunities to advance the other components of the Framework, such as opportunities for mixed-use development in Downtown Flushing, enhancements to public open spaces and streetscapes, improved connections between Downtown Flushing and the Flushing waterfront, and transportation and parking strategies. Goals such as improving environmental conditions in the District and enhancing adjacent regional destinations would not likely be achieved in the future without the proposed project. Additionally, as Willets West, the South Lot, Lot D, and Lot B would remain surface parking areas, the goals outlined in the Framework, such as creating regional destinations that would enhance economic growth in Downtown Flushing and Corona, also are unlikely to be achieved.

SOCIOECONOMICS

The No Action Alternative would not result in direct or indirect residential or business displacement, would not require property acquisition or the relocation of businesses, and would not generate substantial new residents or employees in Queens. The existing auto-related and other businesses would continue to operate, and the one residential unit would remain.

The No Action Alternative would not contribute to the revitalization of the Special Willets Point District or the surrounding area. The proposed project includes a mix of residential,

Willets Point Development

entertainment/retail, hotel, convention center, commercial office, community facility, a public school, publicly accessible open space, and parking uses in the District, Willets West, and Roosevelt Avenue portions of the project site. Under this Alternative, these uses would not be developed, jobs would not be created, and the supply of affordable housing in the study area would not be increased.

Therefore, the No Action Alternative would not result in the economic benefits derived from new jobs, consumers, and residents in the District and Willets West. While the No Action Alternative would not involve the same expenditure of public funds as the proposed project, it would not result in the substantial economic benefits that would be realized with the proposed project.

COMMUNITY FACILITIES

SCHOOLS

Under the No Action Alternative, elementary and intermediate schools in CSD 25/Sub-District 2 and high schools in Queens will be over capacity in 2018, 2028, and 2032. Unlike the proposed project, the No Action Alternative would not generate new demand for public school seats; however, the proposed project would not result in significant adverse impacts on high schools, and would avoid significant adverse impacts on elementary and intermediate schools by creating new school capacity. The Queens Development Group, LLC (QDG) would coordinate with the School Construction Authority (SCA) to determine whether the public school space currently planned as part of Phase 1B would be sufficient to accommodate all of the school children generated by the proposed project by 2028. Provision of the school in Phase 1B would be ensured through a contractual agreement. If necessary, the school spaces would be expanded, and corresponding reductions in square footage would be made elsewhere in the development program. For Phase 2, the New York City Economic Development Corporation (EDC) would require as part of the developer's agreement that the designated developer similarly coordinate with SCA.

LIBRARIES

Under the No Action Alternative, the delivery of library services in the study area would not be adversely affected in 2032. In comparison, the lead agency, in consultation with the Queens Public Library, has determined that the additional population introduced by the proposed project would impair the delivery of library services in the study area in 2032. To mitigate this impact, adequate space¹ within the 125,000 square feet of as-yet-unprogrammed community facility space in the program for Phase 2 ~~could potentially~~ would be made available to be utilized as a branch library or auxiliary facility for the Queens Library system, or additional volumes or programs to accommodate new users could be provided if adequate space in nearby branches exists. Although no developer has yet been designated for Phase 2, the provision of additional library space in Phase 2 would be based on further consultation with Queens Public Library and the lead agency.

¹ In other projects, 15,000–20,000 square feet of community facility space has been adequate for the operation of a branch library.

CHILD CARE

Under the No Action Alternative, known planned or proposed development projects in the study area would introduce approximately 76 additional children under age six who would be eligible for publicly funded child care programs. Therefore, the utilization rate for publicly funded child care facilities serving the study area is assumed to increase from 97 percent under existing conditions to 107 percent in the No Action Alternative, with a shortfall of 55 slots. By comparison, the proposed project may result in significant adverse impacts on publicly funded child care facilities in 2028. To mitigate this impact, QDG (i) would consult with the New York City Administration for Child Services (ACS) to determine whether adding capacity to existing facilities or providing a new child care facility within or near the area surrounding the project site is the appropriate way to meet demand for child care services generated by the proposed project; and (ii) would, as directed by ACS, add capacity to existing facilities or provide a new child care facility within or near the area surrounding the project site. EDC would require, as part of the developer's agreement, that the designated developer of Phase 2 similarly consult with ACS to determine the appropriate way to meet demand for child care services generated by development in the District by 2032. Such mitigation would not occur in the No Action Alternative.

HEALTHCARE

Like the proposed project, the No Action Alternative would not adversely affect the overall provision of health care services.

POLICE AND FIRE PROTECTION SERVICES

The No Action Alternative would generate fewer new worker and visitor populations and would result in a lower demand for police and fire protection services than the proposed project. With the proposed project, both NYPD and FDNY would continue to reevaluate their staffing and resource needs and would continue to have the ability to adjust to congestion en route to emergencies. Response times are not expected to dramatically change in such a way as to result in a significant adverse impact.

OPEN SPACE

The No Action Alternative would not generate the same level of demand for open space resources as the proposed project; however, it also would not introduce substantial new open space within the District. Under the No Action Alternative, residents and workers within the study area would continue to be well served by open space. With the proposed project, open space ratios would remain above the recommended City guidelines, with the exception of the active open space ratio, which would decrease from 1.81 acres per 1,000 residents in the No Action Alternative to 1.55 in the 2028 With Action condition and 1.32 in the 2032 With Action condition. However, these decreases would not result in a significant adverse open space impact.

SHADOWS

Unlike the proposed project, the No Action Alternative would not cast any new shadows on public open space or other sun-sensitive resources. Neither the No Action Alternative nor the proposed project would result in any significant adverse shadows impacts.

HISTORIC AND CULTURAL RESOURCES

Neither the No Action Alternative nor the proposed project would adversely affect archaeological resources. Unlike the proposed project, under the No Action Alternative there would be no adverse impacts to historic resources. With the proposed project, it is anticipated that the former Empire Millwork Corporation Building would be demolished, resulting in a significant adverse impact on this historic resource.

URBAN DESIGN AND VISUAL RESOURCES

Unlike the proposed project, the No Action Alternative would not alter the urban design of the project site. The No Action Alternative would not result in any new construction on the project site, whereas the proposed project would result in the development of multiple buildings of varying heights and the transformation of this area with new residential, entertainment/retail, hotel, school, community facility, office, and convention center. The No Action Alternative also would not result in the creation of any new public open space within the District. While the proposed project would create some taller structures within the District, it would not adversely affect any views to visual resources in the surrounding area. Therefore, neither the No Action Alternative nor the proposed project would adversely affect urban design or visual resources.

NATURAL RESOURCES

Like the proposed project, the No Action Alternative would not result in significant adverse impacts on floodplains, wetlands, sediments, groundwater, terrestrial resources, aquatic resources, endangered, threatened species, or species of special concern and rare ecological communities, and Essential Fish Habitat (EFH). In the No Action Alternative, the several proposed and ongoing projects aimed at improving water quality and aquatic resources in New York, including in Flushing Bay and Flushing River, would occur independently of the proposed project. However, the No Action Alternative would not result in improvements to the existing infrastructure within the District, and the grade would not be raised above the existing 100-year floodplain. As a result, frequent flooding of the area would continue, likely getting worse with projected sea-level rise due to climate change, and the stormwater runoff would continue to pose a threat to the surrounding water bodies and groundwater.

HAZARDOUS MATERIALS

Under the No Action Alternative, in the event that projects independent of the proposed project were to occur, such development would not be expected to result in significant adverse impacts with respect to hazardous materials. With the No Action Alternative, the Special Willets Point District portion of the project site would have both continued New York State Department of Environmental Conservation (NYSDEC) involvement (related to spill cleanup and enforcement actions) and NYC Office of Environmental Remediation (OER) involvement related to the existing E designations. For portions of the sites outside of the District, any future development would be subject to new City leases and/or disposition agreements which would set forth hazardous materials requirements, similar to those associated with the proposed project, but tailored to the development (e.g., extent of proposed soil disturbance and land use).

WATER AND SEWER INFRASTRUCTURE

Neither the No Action Alternative nor the proposed project would result in any significant adverse impacts to water and sewer infrastructure. However, in the No Action Alternative, the

infrastructure that would be constructed as part of the proposed project would likely not be built, the grade would likely not be raised to above the existing 100-year floodplain, and the District would continue to be vulnerable to frequent flooding, likely getting worse with projected sea-level rise due to climate change. Under the No Action Alternative, stormwater runoff would likely continue to carry existing suspected contaminants from the site to nearby water bodies and groundwater. Existing water demand and sanitary sewer generation is expected to remain unchanged. Future sanitary sewage generation is estimated to continue to be directed to the existing septic system, but a limited volume may be directed to the municipal infrastructure improvements currently under construction. No changes to the stormwater runoff coefficient would occur in the No Action Alternative. New York City Department of Environmental Protection (DEP) is working to reduce combined sewer overflows (CSOs) via upgrades at water pollution treatment plants (WTP), storm sewer expansions, and CSO retention tanks, and as with the proposed project, a reduction in CSOs would occur. With the proposed project, infrastructure improvements would be implemented for various phases of the project.

SOLID WASTE AND SANITATION

Neither the No Action Alternative nor the proposed project would result in significant adverse impacts to solid waste and sanitation. The No Action Alternative would not result in new development on the project site; therefore, it would not generate new demand for municipal solid waste collection and also would not result in the displacement of two waste transfer businesses currently operating in the District. Independent of the proposed action, there would be some changes in the City's waste management services to the project site, including completion of a new Marine Transfer Station (MTS) that will have the capacity to handle up to 3,672 tons per day of solid waste under normal conditions.

ENERGY

The No Action Alternative would generate less energy demand than the proposed project. With both the No Action Alternative and the proposed project, it is expected that measures will be taken to provide adequate electrical capacity to the New York City metropolitan area through 2032 and beyond. It is also assumed that Con Edison would continue to implement its electrical distribution improvement programs in Queens. In the future, it is expected that the existing trend toward sustainability would lead to greater energy efficiency in the City. Therefore, it is anticipated that energy supplies could meet the demand from the project site under both the No Action Alternative and the proposed project.

TRANSPORTATION

TRAFFIC

While the No Action Alternative would not generate new vehicular traffic, there would be increased volumes from background growth and other proposed development projects outside of the project site. Overall, the resulting volumes would be lower than with the proposed project; however, there would be a number of intersections on a typical weekday with substandard operations with the No Action Alternative.

The summary overview of the No Action Alternative for Phase 1A (2018) without a Mets game indicates that:

Willeys Point Development

- In the weekday AM peak hour, of the 26 signalized intersections analyzed, the number of locations that are projected to operate at overall level of service (LOS) E or F would increase from none under existing conditions to eight. The number of traffic lane groups projected to operate at LOS E or F would increase from 13 to ~~32~~ 31.
- In the weekday midday peak hour, the number of signalized intersections that would operate at overall LOS E or F would increase from zero to five, while the number of traffic lane groups at LOS E or F would increase from eight to 26.
- In the weekday PM peak hour, the number of locations that are projected to operate at overall LOS E or F would increase from none under existing conditions to six. The number of lane groups projected to operate at LOS E or F would increase from 13 to ~~34~~ 33.
- In the Saturday midday peak hour, the number of signalized intersections that would operate at overall LOS E or F would increase from zero to eight, while the number of lane groups at LOS E or F would increase from 11 to ~~33~~ 32.

Under the No Action Alternative with a Mets game for Phase 1A, traffic conditions in the study area would be as described below:

- In the weekday PM pre-game peak hour, of the 26 signalized intersections analyzed, the number of locations that are projected to operate at LOS E or F would increase from zero under existing conditions to eight. The number of traffic lane groups projected to operate at LOS E or F would increase from 16 to ~~32~~ 31.
- In the Saturday afternoon pre-game peak hour, the number of locations that are projected to operate at LOS E or F would increase from zero under existing conditions to nine. The number of lane groups projected to operate at LOS E or F would increase from 18 to 33. The unsignalized intersection of Boat Basin Road at Stadium Road/CitiField Entrance 8 would operate at LOS E.
- In the Saturday PM post-game peak hour, the number of locations that are projected to operate at LOS E or F would increase from zero under existing conditions to 11. The number of lane groups projected to operate at LOS E or F would increase from 16 to ~~38~~ 37. The unsignalized intersections of Boat Basin Road at World's Fair Marina and Grand Central Parkway Ramp at West Park Loop/Stadium Road would operate at LOS E, and the unsignalized intersection of Boat Basin Road at Stadium Road/CitiField Entrance 8 would operate at LOS F.

The summary overview of the No Action Alternative for Phase 1B (2028) without a Mets game indicates that:

- In the weekday AM peak hour, of the 26 signalized intersections analyzed, the number of locations that are projected to operate at overall LOS E or F would increase from none under existing conditions to eight. The number of traffic lane groups projected to operate at LOS E or F would increase from 13 to 33.
- In the weekday midday peak hour, the number of signalized intersections that would operate at overall LOS E or F would increase from zero to six, while the number of traffic lane groups at LOS E or F would increase from eight to 27.
- In the weekday PM peak hour, the number of locations that are projected to operate at overall LOS E or F would increase from none under existing conditions to ~~nine~~ eight. The number of lane groups projected to operate at LOS E or F would increase from 13 to ~~35~~ 36.

- In the Saturday midday peak hour, the number of signalized intersections that would operate at overall LOS E or F would increase from zero to nine, while the number of lane groups at LOS E or F would increase from 11 to ~~37~~ 36.

Under the No Action Alternative with a Mets game for Phase 1B, traffic conditions in the study area would be as follows.

- In the weekday PM pre-game peak hour, of the 26 signalized intersections analyzed, the number of locations that are projected to operate at LOS E or F would increase from zero under existing conditions to eight. The number of traffic lane groups projected to operate at LOS E or F would increase from 16 to ~~37~~ 38.
- In the Saturday afternoon pre-game peak hour, the number of locations that are projected to operate at LOS E or F would increase from zero under existing conditions to 11. The number of lane groups projected to operate at LOS E or F would increase from 18 to 35. The unsignalized intersection of Boat Basin Road at Stadium Road/CitiField Entrance 8 would operate at LOS F.
- In the Saturday PM post-game peak hour, the number of locations that are projected to operate at LOS E or F would increase from zero under existing conditions to 13. The number of lane groups projected to operate at LOS E or F would increase from 16 to ~~38~~ 37. The unsignalized intersection of Grand Central Parkway Ramp at West Park Loop/Stadium Road would operate at LOS E, and the unsignalized intersections of Boat Basin Road at World's Fair Marina and Boat Basin Road at Stadium Road/CitiField Entrance 8 would operate at LOS F.

The summary overview of the No Action Alternative for Phase 2 (2032) without a Mets game indicates that:

- In the weekday AM peak hour, of the 26 signalized intersections analyzed, the number of locations that are projected to operate at overall LOS E or F would increase from none under existing conditions to eight. The number of traffic lane groups projected to operate at LOS E or F would increase from 13 to 35.
- In the weekday midday peak hour, the number of signalized intersections that would operate at overall LOS E or F would increase from zero to seven, while the number of traffic lane groups at LOS E or F would increase from eight to 28.
- In the weekday PM peak hour, the number of locations that are projected to operate at overall LOS E or F would increase from none under existing conditions to ~~nine~~ eight. The number of lane groups projected to operate at LOS E or F would increase from 13 to ~~34~~ 35.
- In the Saturday midday peak hour, the number of signalized intersections that would operate at overall LOS E or F would increase from zero to ten, while the number of lane groups at LOS E or F would increase from 11 to ~~37~~ 36.

Under the No Action Alternative with a Mets game for Phase 2, traffic conditions in the study area would be as follows.

- In the weekday PM pre-game peak hour, of the 26 signalized intersections analyzed, the number of locations that are projected to operate at LOS E or F would increase from zero under existing conditions to eight. The number of traffic lane groups projected to operate at LOS E or F would increase from 16 to ~~39~~ 40.

Willeys Point Development

- In the Saturday midday pre-game peak hour, the number of locations that are projected to operate at LOS E or F would increase from zero under existing conditions to 12. The number of lane groups projected to operate at LOS E or F would increase from 18 to 38. The unsignalized intersection of Boat Basin Road at Stadium Road/CitiField Entrance 8 would operate at LOS F.
- In the Saturday PM post-game peak hour, the number of locations that are projected to operate at LOS E or F would increase from zero under existing conditions to 14. The number of lane groups projected to operate at LOS E or F would increase from 16 to ~~38~~ 37. The unsignalized intersection of Grand Central Parkway Ramp at West Park Loop/Stadium Road would operate at LOS E, and the unsignalized intersections of Boat Basin Road at World's Fair Marina and Boat Basin Road at Stadium Road/CitiField Entrance 8 would operate at LOS F.

The proposed project would result in more locations with substandard operations, but as detailed in Chapter 21, "Mitigation," depending on the peak hour, approximately one-half or more of the significantly impacted locations could be fully or partially mitigated with traffic signal operation changes, such as signal phasing and/or timing changes, signalization of an unsignalized intersection, lane re-striping, parking prohibitions, or turn prohibitions, with the exception of three locations—including 126th Street at Northern Boulevard, 126th Street/Grand Central Parkway (GCP) ramp at 34th Avenue, and the GCP exit ramp at West Park Loop/Stadium Road—which would require special, more intensive mitigation measures to partially or fully mitigate the significant impacts in peak hours.

For significant adverse impacts that would be unmitigated or partially mitigated with the proposed project, traffic operations would be better under the No Action Alternative. However, in either case, there would continue to be a number of congested locations within the study area with LOS E or F conditions during the peak hours analyzed.

HIGHWAY NETWORK

The No Action Alternative would not generate new vehicular traffic on the highway network, but there would be increased volumes from background growth and other proposed development projects outside of the project site. In addition, the proposed ramp connection to the Van Wyck Expressway (proposed under the Phase 1B and 2 With Action conditions) would not be provided as part of the No Action Alternative. With the proposed project, volumes would be higher during all time periods, but in both the No Action and With Action scenarios, there would be considerable congestion at multiple locations within the highway network.

Under the Phase 1A No Action Alternative, between two and seven of the 19 analyzed highway mainlines and ramps would operate at marginally unacceptable or unacceptable (LOS D, E, or F) conditions on non-game days during each peak hour of analysis. On game days, between five and nine of the 19 analyzed highway mainlines and ramps would operate at marginally unacceptable or unacceptable (LOS D, E, or F) conditions during each peak hour of analysis.

Under the Phase 1B No Action Alternative, between one and seven of the 19 analyzed highway mainlines and ramps would operate at marginally unacceptable or unacceptable (LOS D, E, or F) conditions on non-game days during each peak hour of analysis. On game days, between four and eight of the 19 analyzed highway mainlines and ramps would operate at marginally unacceptable or unacceptable (LOS D, E, or F) conditions during each peak hour of analysis.

Under the Phase 2 No Action Alternative, between one and ~~seven~~ nine of the 19 analyzed highway mainlines and ramps would operate at marginally unacceptable or unacceptable (LOS D, E, or F) conditions on non-game days during each peak hour of analysis. On game days, between four and ~~ten~~ eight of the 19 analyzed highway mainlines and ramps would operate at marginally unacceptable or unacceptable (LOS D, E, or F) conditions during each peak hour of analysis.

PARKING

The No Action Alternative itself would not generate new demand for parking, but it would also not provide for new on- or off-street parking within the project site. However, parking demand would increase as a result of background growth and other proposed development projects outside of the District.

Under the No Action Alternative, for all three phases of the proposed project, there would be adequate off-street parking to meet demand. The proposed project would provide an increased amount of off-street parking in each phase and, similar to the No Action Alternative, there would be enough overall off-street parking to meet demand.

On a typical weekday (both game day and non-game day), a weekend non-game day, and during the pre-game period on weekend game days, it is projected that on-street parking demand would be at or above capacity in all phases under the No Action Alternative. In Phases 1B and 2 of the proposed project, new on-street parking spaces would be provided within the District. During certain periods, this parking would not be fully occupied and could accommodate some of the non-project unmet demand that would occur under the No Action Alternative. Therefore, it is anticipated that the proposed project would provide for greater capacity to meet parking demand than the No Action Alternative.

Under the No Action Alternative, Mets parking would not be affected, whereas the proposed project would relocate 4,100 Mets parking spaces within the immediate area. Therefore, Mets parking needs would be similarly satisfied under both the No Action Alternative and the proposed project.

TRANSIT

The No Action Alternative itself would not generate new demand for subway service, but there would be additional riders from background growth and other proposed development projects outside of the project site. Under this alternative, all subway station stairways and control area elements would continue to operate at acceptable levels and all analyzed bus routes would continue to operate within their guideline capacities under the 2018, 2028, and 2032 No Action Alternative conditions. As with the proposed project, the No. 7 subway line would continue to operate within guideline capacity during the weekday AM peak period for the Manhattan-bound local service and during the PM peak period for the Flushing-bound service under the 2018, 2028, and 2032 No Action Alternative conditions. However, the Manhattan-bound express service would continue to exceed the guideline capacity during the weekday AM peak period under the 2018, 2028, and 2032 No Action Alternative conditions.

In 2018, both the No Action Alternative and the proposed project with Phase 1A completed would not result in any significant adverse transit impacts. In 2028, the No Action Alternative would not result in the significant adverse bus line-haul impacts on the Q19, Q48, and Q66 routes and significant adverse subway line-haul impacts on the No. 7 line Manhattan-bound

Willets Point Development

express service, as identified for the proposed project with Phase 1B completed. It should be noted that this significant adverse line-haul impact on the No. 7 line would not occur until Phase 2 should NYCT be able to process an additional Manhattan-bound express train during the AM peak hour, as assumed in the DSEIS. In 2032, the No Action Alternative would not result in the significant adverse impacts on the Mets-Willets Point subway station's north stairways, the No. 7 line Manhattan-bound express service, and the Q19, Q48, and Q66 bus routes, as identified for the proposed project with Phase 2 built out.

It should be noted that if NYCT reverts back to its pre-CitiField station operation plan, which could take place independent of the proposed project and whereby passage through the station between parking in South Lot/Lot D and the north side of Roosevelt Avenue could be made only within the unpaid zone, additional congestion would be expected on game days, which occur on average only approximately 80, 40 to 50 times a year, for Met patrons traveling between parking in South Lot/Lot D and CitiField through the station. However, under the No Action Alternative, no significant adverse impacts would result at the circulation elements along this station pedestrian route, as would under the With Action conditions.

PEDESTRIANS

The No Action Alternative itself would not generate new pedestrian trips, but there would be additional demand from general background growth and other proposed development projects outside of the project site. Under this alternative, all pedestrian elements except for the north and south crosswalks of 34th Avenue and 126th Street during the weekend post-game peak period, would continue to operate at acceptable levels (maximum of 8.5 PMF platoon flows for sidewalks; minimum of 19.5 SFP for corners and crosswalks) during all analysis time periods under the 2018, 2028, and 2032 conditions.

In 2018, the No Action Alternative would not result in the significant adverse crosswalk impacts at the intersections of Northern Boulevard and 126th Street, Roosevelt Avenue and 126th Street, ~~and 34th Avenue and 126th Street, and 37th Avenue and 126th Street,~~ as identified for the proposed project with Phase 1A completed. In 2028, the No Action Alternative would not result in the significant adverse crosswalk impacts at the intersections of Northern Boulevard and 126th Street, Roosevelt Avenue and 126th Street, and 34th Avenue and 126th Street ~~same three intersections~~, as identified for the proposed project with Phase 1B completed. In 2032, the No Action Alternative would not result in the significant adverse crosswalk impacts at the same three intersections identified in 2028, as well as the intersections of ~~New Willets Point Boulevard and 126th Street and~~ Roosevelt Avenue and Lot B Driveway, as identified for the proposed project with Phase 2 built out.

AIR QUALITY

The No Action Alternative would result in less vehicular traffic than the proposed project, and the mobile source emissions would be lower. The No Action Alternative would allow for the continued operation of industrial uses within Willets Point. It would not result in the development of new recreational, residential, hotel, open space, and commercial uses (in Phases 1A and 1B) in close proximity to auto, manufacturing, and industrial uses that may remain in the area proposed for development in Phase 2. However, neither the proposed project nor the No Action Alternative would result in significant adverse air quality impacts. Unlike the proposed project, the No Action Alternative would allow the use of fuel oil for heating and hot water systems and would not require certain restrictions, such as requirements on the fuel type and the

use of low-nitrogen oxide (low-NO_x) burners, to avoid potential stationary source air quality impacts.

GREENHOUSE GAS EMISSIONS AND CLIMATE CHANGE

The No Action Alternative would result in no new development on the project site and less vehicular traffic in the study area than the proposed project, and therefore the potential GHG emissions associated with the No Action Alternative would be lower than with the proposed project. The potential GHG emissions associated with the proposed project in 2032 upon completion of Phase 2 (cumulative with Phases 1A and 1B) are projected to be approximately 160,500 metric tons of CO₂e. However, measures for reducing GHG emissions are included as part of the proposed project, making it consistent with the City's GHG reduction goal. Unlike the proposed project, the No Action Alternative would not include measures to reduce the vulnerability to flood damage, including grading and elevating the project site above the existing 100-year floodplain or measures to make the proposed project site more resilient to projected sea-level rise due to climate change.

NOISE

The No Action Alternative would result in less vehicular traffic in the study area than the proposed project; however, ambient noise levels in the area would continue to be high. As with the proposed project, noise levels under the No Action Alternative (for the 2018, 2028, and 2032 analysis years) at World's Fair Marina Park (Receptor Site 3) and the intersection of Roosevelt Avenue between College Point Boulevard and Prince Street (Receptor Site 2) would be in the "marginally unacceptable" category, and noise levels at the intersection of Roosevelt Avenue between 114th Street and 111th Street (Receptor Site 1) would be in the "clearly unacceptable" category. With the proposed project, lots located within the District would have restrictions placed on them to ensure that adequate attenuation requirements are met within the proposed buildings.

PUBLIC HEALTH

Neither the No Action Alternative nor the proposed project would adversely affect public health.

NEIGHBORHOOD CHARACTER

The No Action Alternative would not alter the current character of the project site. It also would not result in new vehicle trips, and therefore, traffic operations would be less congested as compared with the proposed project. Like the proposed project, the No Action Alternative would not result in significant adverse impacts on neighborhood character.

While conditions with respect to traffic and noise would not be changed under the No Action Alternative, it would not provide the neighborhood character benefits of the proposed project. The No Action Alternative would not transform the area surrounding CitiField into a thriving new neighborhood and regional destination. Furthermore, the No Action Alternative would not represent a significant investment to improve the project area's infrastructure, nor would it remediate existing environmental contaminations as the proposed project would.

CONSTRUCTION

Since there would be no development under the No Action Alternative, potential significant adverse construction impacts related to transportation and historic and cultural resources with construction of the proposed project would not occur. However, the substantial economic benefits attributable to construction expenditures and construction jobs under the proposed project would not be realized under the No Action Alternative.

D. NO UNMITIGATED SIGNIFICANT IMPACTS ALTERNATIVE

DESCRIPTION

The proposed project would result in some unmitigated impacts with respect to historic and cultural resources, traffic, transit, and pedestrians. Therefore, as required by the *CEQR Technical Manual*, alternatives were developed to explore modifications to the proposed actions that would allow for the mitigation of these impacts.

HISTORIC AND CULTURAL RESOURCES

The proposed project would result in the demolition of the former Empire Millwork Corporation Building, which is considered eligible for State and National Registers of Historic Places (S/NR) listing by the New York State Office of Parks, Recreation & Historic Preservation (OPHRP), but measures such as photographic documentation of this resource would be undertaken to partially mitigate this impact. The No Unmitigated Significant Impacts Alternative would avoid demolition of this historic resource. Under this alternative, any new development within the District during Phase 2 of the proposed project would be designed so as to leave this structure in place. This could be achieved through adaptive reuse, but exterior elements such as windows and facades would need to be upgraded to comply with building codes and noise attenuation requirements. Furthermore, the building is located below flood elevation, and its site could not be raised if it would remain. Therefore, flood protection measures such as gates or pumps would be required to comply with flood insurance requirements. This alternative would involve the same discretionary actions as the proposed project. However, preservation of the building would need to be required through the developer's formal request for proposals (RFP) process.

Overall, this alternative would reduce the footprint of any new development within the District, which would result in greater density in the remainder of the District, fewer housing units, less open space, or some combination of these possibilities. The preservation of this resource would also significantly constrain the design of the proposed project in ways that could make future development of the District more difficult and may undermine the benefits of the proposed project. As noted under the No Action Alternative, the former Empire Millwork Corporation Building could be demolished as-of-right under existing conditions, and mitigation measures such as photographic documentation would not be required.

TRAFFIC

~~The proposed project and the potential future development on Lot B would result in significant adverse traffic impacts at intersections and on highway segments within the study area that cannot be fully alleviated with practical mitigation measures. As described more fully in Chapter 21, "Mitigation," mitigation measures requiring further agency review prior to implementation~~

~~are proposed for six intersections. If the mitigation measures at these locations are not implemented, unmitigated significant adverse impacts would occur.~~

Because of existing congestion at a number of intersections, even a minimal increase in traffic would result in unmitigated impacts. Based on a sensitivity analysis of intersections within the study area, it was determined that, even as early as in Phase 1A completion in 2018, the addition of five or less vehicles through some intersections would create an impact that cannot be fully mitigated. This would be the case for all three phases of the proposed project. Thus, almost any new development at the project site would result in unmitigated traffic impacts, and no reasonable alternative could be developed to avoid such impacts without substantially compromising the proposed project's stated goals.

TRANSIT

The proposed project and potential future development on Lot B would result in significant adverse subway line-haul impacts on the Manhattan-bound No.7 subway line express service during the 2028 and 2032 AM peak periods and on station operations at the Mets-Willets Point subway station under the 2018, 2028, and 2032 With Action conditions. Should NYCT revert back to its pre-CitiField station operating plan for the Mets-Willets Point subway station, the significant adverse impacts on station operations may potentially be deemed unmitigatable. Although the City had consulted with the MTA on extending regular LIRR service to Willets Point, which would be expected to provide substantial relief to the No. 7 subway line and may prevent this significant adverse subway impact from materializing, the implementation of the LIRR service improvement would depend on whether the actual future demand shows that such service improvement is warranted. It should be noted that this significant adverse line-haul impact on the No. 7 line would not occur until Phase 2 should NYCT be able to process an additional Manhattan-bound express train during the AM peak hour, as assumed in the DSEIS. Since there are constraints on what service improvements are available to NYCT, the identified significant line-haul capacity impact on the No. 7 line would likely remain unmitigated absent the introduction of new LIRR service to the area. The feasibility of stairway widening and elevator installation at the Mets-Willets Point subway station were ~~will be~~ further evaluated between the Draft and Final SEIS. ~~In the event these mitigation measures are determined to be infeasible, the projected significant adverse stairway impacts would be deemed unmitigatable.~~ Specifically, an engineering feasibility study and design schematics were prepared and concluded that the recommended stairway widenings, as well as the installation of an Americans with Disabilities Act (ADA)-compliant elevator, would be feasible. It should be noted that the above proposed mitigation measures could be subject to modification due to NYCT's future master plan for the Mets-Willets Point subway station. Any modifications in conformance with the future master plan would provide equivalent functionality that would similarly mitigate the stairway impacts identified above. Since the projected impacts that prompted the stairway and elevator feasibility study would not occur until Phase 2 of the proposed project, no funding commitments are in place at this time. The City will coordinate with NYCT to ensure the proper mitigation would be implemented at the appropriate time and would add language to the RFP for Phase 2 of the project, requiring the designated developer to fund the implementation of this mitigation.

To avoid the potentially unmitigatable impact on line-haul capacity, portions or all of Phase 1B and Phase 2 of the proposed project and potential future development on Lot B would need to be eliminated from the current development plan. Almost any new development at the project site would result in the potentially unmitigatable impact on station operations at the Mets-Willets

Willets Point Development

Point subway station, and no reasonable alternative could be developed to avoid such impacts without substantially compromising the proposed project's stated goals.

PEDESTRIANS

The proposed project and potential future development on Lot B would result in significant adverse pedestrian impacts at ~~five~~seven study area crosswalks upon Phase 1A completion, five study area crosswalks upon and Phase 1B completion, and seven study area crosswalks upon the Phase 2 full build-out in 2018, 2028, and 2032, respectively. ~~in 2018 and 2028, respectively, and at eight study area crosswalks upon the Phase 2 full build out in 2032.~~ Although potential pedestrian mitigation measures, some of which in conjunction with the proposed traffic mitigation measures, have been developed to address these impacts to the extent practicable, potentially unmitigatable pedestrian impacts could still occur with the development of Phase 1A of the proposed project. Hence, no reasonable alternative could be developed to avoid such impacts without substantially compromising the proposed project's stated goals. *

A. INTRODUCTION

Unavoidable significant adverse impacts are defined as those that meet the following two criteria:

- There are no reasonably practicable mitigation measures to eliminate the impacts; and
- There are no reasonable alternatives to the proposed project that would meet the purpose and need of the action, eliminate the impact, and not cause other or similar significant adverse impacts.

As described in Chapter 21, “Mitigation,” a number of the potential impacts identified for the proposed project could be mitigated. However, as described below, in some cases, project impacts would not be fully mitigated.

B. HISTORIC AND CULTURAL RESOURCES

As described in Chapter 7, “Historic and Cultural Resources,” Phase 2 of the proposed project contemplates demolition of the former Empire Millwork Corporation Building, located at 128-50 Willets Point Boulevard in the Special Willets Point District. Demolition of this building would constitute a significant adverse impact on this historic resource. A developer for Phase 2 has not yet been selected, and the Queens Development Group, LLC (QDG) may or may not be selected as the designated developer for Phase 2. Before the development of Phase 2, the selected developer will consult with the New York State Office of Parks, Recreation and Historic Preservation (OPRHP) and the New York City Landmarks Preservation Commission (LPC) to evaluate any remaining potential alternatives to demolition. If none are identified, measures to mitigate this adverse impact would be developed in consultation with OPRHP and LPC. The mitigation measures could include recording the building through a Historic American Buildings Survey (HABS)-level photographic documentation and accompanying narrative. However, this impact would not be completely eliminated, as the resource would still be demolished. Therefore, consistent with the conclusions of the 2008 FGEIS, the demolition would constitute an unavoidable significant adverse impact on this historic resource as a result of the proposed project.

C. TRANSPORTATION**TRAFFIC AND PARKING**

As discussed in the Traffic and Parking section of Chapter 21, “Mitigation,” the proposed project would result in unmitigated impacts at local intersections and highway elements within the traffic study area and partially mitigated impacts at other locations. Not all of the unmitigated impact locations would occur in all seven traffic analysis periods. This section

Willeys Point Development

summarizes the unmitigated and partially mitigated locations based on the mitigation measures described in Chapter 21; for additional information, refer to Chapter 21.

LOCAL INTERSECTIONS

Under Phase 1A, ~~8~~ 13 of the ~~29~~ 32 intersections analyzed would have significant impacts that could not be fully mitigated in at least one peak hour, including:

- Astoria Boulevard at 108th Street;
- Northern Boulevard at 126th Street, Prince Street and at Main Street;
- Roosevelt Avenue at 108th Street, 114th Street, 126th Street, College Point Boulevard, and Union Street; ~~and~~
- 126th Street at 34th Avenue, 36th Avenue, and 37th Avenue; and
- Boat Basin Road at Stadium Road.

Under Phase 1B, ~~44~~ 18 of the ~~30~~ 33 intersections analyzed (there is one additional intersection analyzed in the study area under Phase 1B) would have significant impacts that could not be fully mitigated in at least one peak hour, including the following locations in addition to those cited above for Phase 1A (Note: the intersection of Roosevelt Avenue at 108th Street, which could not be fully mitigated in Phase 1A, could be fully mitigated in Phase 1B):

- Northern Boulevard at Union Street and at Parsons Boulevard;
- ~~34th Avenue at 126th Street;~~
- Roosevelt Avenue at 111th Street, at Main Street, and at Parsons Boulevard; and
- Sanford Avenue at Parsons Boulevard.

Under Phase 2, ~~48~~ 23 of the ~~34~~ 34 intersections analyzed (there is one more intersection analyzed in the study area under Phase 2) would have significant impacts that could not be fully mitigated in at least one peak hour, including the following locations in addition to those cited above for Phase 1B:

- Northern Boulevard at 108th Street and at 114th Street;
- Roosevelt Avenue at 108th Street and Prince Street; ~~114th Street~~; and
- Northern Boulevard at College Point Boulevard.

HIGHWAY NETWORK

Under Phase 1A, 6 of the 19 highway elements analyzed would have significant impacts that could not be fully mitigated in at least one peak hour, including:

- Westbound Grand Central Parkway (GCP) mainline (east side and west side), between Roosevelt Avenue and the Long Island Expressway (LIE);
- ~~Southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place;~~
- Southbound Van Wyck Expressway between Roosevelt Avenue and the LIE;
- Ramp from the northbound Whitestone Expressway to the southbound Van Wyck Expressway;
- Ramp from the Grand Central Parkway/eastbound Astoria Boulevard to the northbound Whitestone Expressway/eastbound Northern Boulevard; and

- Ramp from the southbound Whitestone Expressway to westbound Northern Boulevard.

~~As discussed in Chapter 21, “Mitigation,” there would be additional highway locations that would be slightly or moderately impacted due to the implementation of mitigation measures at local intersections and highway ramps. In Phase 1A, the eastbound GCP mainline between Roosevelt Avenue and the LIE would be slightly impacted and unmitigated during one of the seven peak traffic analysis hours.~~

Under Phase 1B, ~~40~~ 11 of the 19 analyzed highway elements would have significant traffic impacts that could not be fully mitigated in at least one peak hour, including the following locations in addition to those cited under Phase 1A (Note: the ramp from the northbound Whitestone Expressway to the southbound Van Wyck Expressway, which could not be fully mitigated in Phase 1A, could be fully mitigated in Phase 1B):

- Northbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE;
- Southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place;
- Ramp from the northbound Van Wyck Expressway to eastbound Northern Boulevard;
- Ramp from the northbound Van Wyck Expressway to westbound Northern Boulevard;
- Ramp from westbound Northern Boulevard to the southbound Van Wyck Expressway; and
- Ramp from the westbound GCP toward Stadium Road and the northbound Whitestone Expressway.

~~As mentioned above for Phase 1A, in Chapter 21, there would be additional highway locations that would be slightly or moderately impacted due to the implementation of mitigation measures at local intersections and highway ramps, including the following in addition to the one location cited above for Phase 1A:~~

- Eastbound Grand Central Parkway mainline between Roosevelt Avenue and the LIE;
- Southbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE;
- Southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place; and
- Ramp from World’s Fair Marina/Boat Basin Road to the westbound Grand Central Parkway.
- ~~• Ramp from the northbound Whitestone Expressway to the southbound Van Wyck Expressway; and~~
- ~~• Ramp from westbound Northern Boulevard to the southbound Van Wyck Expressway.~~

Under Phase 2, the same 11 of the 19 analyzed highway elements would have significant impacts that could not be fully mitigated in at least one peak hour as in Phases 1A and 1B above. ~~, including the following location in addition to those cited for Phases 1A and 1B:~~

- ~~• Southbound Van Wyck Expressway mainline between Roosevelt Avenue and the LIE.~~

~~As mentioned above for Phases 1A and 1B, there would be additional highway locations that would be slightly or moderately impacted due to the implementation of mitigation measures at local intersections and highway ramps, including the following in addition to locations cited above for Phases 1A and 1B:~~

Willets Point Development

- Westbound Grand Central Parkway mainline (east side), between Roosevelt Avenue and the LIE;
- Northbound Whitestone Expressway mainline between Northern Boulevard and Linden Place;
- Ramp from World's Fair Marina/Boat Basin Road to the westbound GCP; and
- Ramp from the northbound Whitestone Expressway to the southbound Van Wyck Expressway;
- Ramp from the southbound Whitestone Expressway to the westbound GCP; and
- Ramp from westbound Northern Boulevard to the southbound Van Wyck Expressway.

As described in the Mitigation chapter, mitigation measures are proposed that would require further agency review prior to implementation at the following ~~six~~ three intersections: Grand Central Parkway (GCP) Exit Ramp at West Park Loop/Stadium Road, 126th Street/GCP Exit Ramp/34th Avenue, and Northern Boulevard at 126th Street, ~~World's Fair Marina at Boat Basin Road, Boat Basin Road at Stadium Road and Northern Boulevard at 114th Street.~~ If the mitigation measures at these locations are reviewed and concurs with the operational analysis that was undertaken for the improvements for the intersections at the Grand Central Parkway westbound exit ramp at West Park Loop/Stadium Road, the intersection of 126th Street/GCP Exit Ramp/34th Avenue, and the intersection of Northern Boulevard and 126th Street; NYCDOT has given approval for those measures within its jurisdiction (i.e., installation of a traffic signal at the intersection of West Park Loop/Stadium Road). Final design for construction of those measures which do not fall under the jurisdiction of NYCDOT will be further reviewed by the New York State Department of Transportation (NYSDOT) closer to the time of construction. If the mitigation measures at these locations are rejected by NYSDOT and not implemented, significant adverse impacts identified above would be unmitigated, including but not necessarily limited to the westbound Grand Central Parkway (the east side, between Roosevelt Avenue and the LIE), the southbound Whitestone Expressway mainline between Northern Boulevard and Linden Place, the ramp from the southbound Whitestone Expressway to westbound Northern Boulevard, the ramp from the westbound Grand Central Parkway toward Stadium Road and the northbound Whitestone Expressway, and the ramp from eastbound Astoria Boulevard and the Grand Central Parkway to the northbound Whitestone Expressway and eastbound Northern Boulevard in addition to the intersections of the Grand Central Parkway westbound exit ramp at West Park Loop/Stadium Road, 126th Street/GCP Exit Ramp/34th Avenue, and Northern Boulevard and 126th Street.

~~In addition, the intersections of 126th Street at 36th Avenue, 126th Street at 37th Avenue, and Northern Boulevard at 126th Place will be analyzed and the related findings will be presented in the Final EIS. If these intersections are found to be significantly impacted, mitigation measures would be explored to address the impacts, or if no practicable mitigation measures can be identified, the impacts would be disclosed as being unmitigatable.~~

TRANSIT AND PEDESTRIANS

As discussed in the Transit and Pedestrians section of Chapter 21, the proposed project would potentially result in unmitigated significant adverse impacts on station operations at the Mets-Willets Point subway station under the 2018, 2028, and 2032 With Action conditions, subway line haul operations for the No. 7 line under the 2032 With Action condition, and street level pedestrian facility operations under the 2018, 2028, and 2032 With Action conditions. Not all of

these potentially unmitigated impacts would occur in all analysis time periods. This section summarizes the potentially unmitigated and partially mitigated locations; for additional information, refer to Chapter 21.

SUBWAY STATION OPERATIONS

Under Phase 2, the proposed project would result in significant adverse impacts on the S-3, S-2, and M-4 stairways located on the north side of Roosevelt Avenue, requiring stairway widenings and the installation of an Americans with Disabilities Act (ADA)-compliant elevator between the street and mezzanine levels. The feasibility of the stairway widening and elevator installation ~~were will be~~ further evaluated between the Draft and Final SEIS. ~~In the event these mitigation measures are determined to be infeasible, the projected significant adverse stairway impacts would be deemed unmitigatable. Specifically, an engineering feasibility study and design schematics were prepared and concluded that the recommended stairway widenings, as well as the installation of an ADA-compliant elevator, would be feasible. It should be noted that the above proposed mitigation measures may be subject to modification due to New York City Transit's (NYCT) future master plan for the Mets-Willets Point subway station. Any modifications in conformance with the future master plan would provide equivalent functionalities that would similarly mitigate the stairway impacts identified above. Since the projected impacts that prompted the stairway and elevator feasibility study would not occur until Phase 2 of the proposed project, no funding commitments are in place at this time. The City will coordinate with NYCT and the lead agency to ensure the proper mitigation would be implemented at the appropriate time and would add language to the Request for Proposals (RFP) for Phase 2 of the project as well as to the development agreement and/or other legally binding agreements, requiring the designated developer to fund the implementation of this mitigation.~~

In addition, NYCT may revert back to its pre-CitiField station operating plan for the Mets-Willets Point subway station, whereby passage through the station between parking in South Lot/Lot D and the north side of Roosevelt Avenue could be made only within the unpaid zone. If NYCT decides to proceed with this plan, which would take place independent of the proposed project, additional impacts for the station's street-level connections and the unpaid zone passageway could occur during game days. Although these impacts would be intermittent, occurring on average only approximately 80 40 to 50 times a year, and subject to game-day traffic and pedestrian management, they may potentially be deemed unmitigatable. No changes to operating plans were announced by NYCT between the Draft and Final SEIS; therefore, any potential changes that may be considered for future implementation will be addressed outside of this environmental review.

SUBWAY LINE HAUL

Under Phase 1B and Phase 2, the proposed project would result in a significant adverse impact on the Manhattan-bound No. 7 subway line express service during the AM peak period. It should be noted that this significant adverse line-haul impact on the No. 7 line would not occur until Phase 2 should NYCT be able to process an additional Manhattan-bound express train during the AM peak hour, as assumed in the Draft SEIS. The addition of regular Long Island Rail Road (LIRR) service to Willets Point would provide substantial relief to the No. 7 subway line and may prevent this significant adverse subway impact from materializing. Since there are constraints on what service improvements are available to NYCT, the identified significant line-haul capacity impact on the No. 7 line would likely remain unmitigated absent the introduction of new LIRR service to the area.

PEDESTRIANS

Under Phases 1A and 1B, widening the east crosswalk of Northern Boulevard and 126th Street could fully mitigate the significant adverse impact during all peak periods. However, if the proposed widening was determined to be infeasible, the projected significant adverse impacts at this crosswalk would be either partially mitigated or unmitigated.

Under Phase 2, widening the east crosswalk of Northern Boulevard and 126th Street, the west crosswalk of Roosevelt Avenue and 126th Street, and the east crosswalk of 34th Avenue and 126th Street could fully mitigate the significant adverse impacts during all peak periods. However, if the proposed widenings were determined to be infeasible, the projected significant adverse impacts at these crosswalks would be either partially mitigated or unmitigated.

In addition, related pedestrian analyses ~~will be~~ were prepared for the three intersections (126th Street at 36th Avenue, 126th Street at 37th Avenue, and Northern Boulevard at 126th Place) where additional traffic analyses ~~will~~ were also be conducted and are presented in ~~the~~ this Final SEIS. Mitigation measures were recommended where appropriate for the additional three intersections and would not result in any additional unmitigatable impacts. If additional pedestrian impacts are identified, mitigation measures would be explored to address the impacts, or if no practicable mitigation measures can be identified, the impacts would be disclosed as being unmitigatable. *

A. INTRODUCTION

This chapter provides an assessment of the potential growth-inducing aspects of the proposed project. These generally refer to “secondary” impacts that could trigger additional development in areas outside of the project site that would not have such development without the proposed project. The 2012 *City Environmental Quality Review (CEQR) Technical Manual* indicates that an analysis of the growth-inducing aspects of a proposed action is appropriate when an action:

- Adds substantial new land use, new residents, or new employment that could induce additional development of a similar kind or of support uses, such as retail establishments to serve new residential uses; and/or
- Introduces or greatly expands infrastructure capacity.

The proposed project would transform surface parking lots and a largely underutilized site with substantial environmental degradation into a lively, mixed-use, sustainable community and regional destination. The proposed project would introduce a variety of uses, including residential, retail, office, entertainment, hotel, convention center, community facility, open space, and parking (see Chapter 1, “Project Description,” for details). As described in Chapter 1, consistent with the assumptions of the 2008 FGEIS, it is anticipated that if the proposed project is approved and the project site is redeveloped, additional development could occur on CitiField parking Lot B. While specific development plans for Lot B have not yet been proposed, it is anticipated that approximately 280,000 square feet (sf) of office and 184,500 sf of retail could potentially be developed on Lot B.

While any future development on Lot B would require its own environmental review process subject to CEQR, consistent with the 2008 FGEIS, this Supplemental Environmental Impact Statement (SEIS) considers the cumulative impacts of both the proposed project and the potential future development on Lot B. While the uses proposed for Willets West and the Special Willets Point District would contribute to growth in the local Queens, City, and State economies, they would not be expected to induce notable growth outside of the project site and the anticipated development on Lot B. As described in Chapter 2, “Land Use, Zoning, and Public Policy,” it is unlikely that the proposed project and potential future development on Lot B would alter land use patterns in surrounding neighborhoods. Given the recent trend to redevelop underutilized sites near the Flushing River waterfront, it is possible that the proposed project and new development on Lot B could encourage further redevelopment of some nearby underutilized sites along the Flushing River. However, given that such changes are already under way, potential development parcels are limited, and as the project site is physically separated from surrounding neighborhoods by water bodies, roadways, and parkland, the ability of the proposed project to alter land use and economic patterns or induce substantial growth in the study area would be minimal.

Willets Point Development

As described in Chapter 1, substantial infrastructure and roadway improvements would be provided as part of the proposed project. The infrastructure and roadway improvements included in the proposed project are intended to support the anticipated growth in the Willets West and District portions of the project site, as well as the potential future development of Lot B. The infrastructure in the study area is already well-developed such that improvements associated with the proposed project would not induce additional growth. *

Chapter 25: Irreversible and Irretrievable Commitment of Resources

There are a number of resources, both natural and built, that would be expended in the construction and operation of the proposed project. These resources include the building materials used in construction of the proposed project; energy in the form of gas and electricity consumed during construction and operation of the proposed project; and the human effort (time and labor) required to develop, construct, and operate various components of the proposed project. They are considered irretrievably committed because their reuse for some purpose other than the proposed project would be highly unlikely. The proposed project constitutes a commitment of the project site as a land resource, thereby rendering the land's use for other purposes infeasible. However, the transformation of surface parking lots and a largely underutilized site with substandard conditions and substantial environmental degradation into a lively, mixed-use, sustainable community and regional destination would be an improvement to the District and areas surrounding CitiField. *

A. INTRODUCTION

This document summarizes and responds to comments on the Willets Point Development Draft Supplemental Environmental Impact Statement (DSEIS). Oral and written comments were received during the public hearing held by the New York City Planning Commission, on Wednesday, July 10, 2013. Written comments were accepted through the public comment period, which ended on Monday, July 22, 2013.

Section B lists the elected officials, organizations, and individuals who provided comments on the DSEIS. Section C contains a summary of these comments and responses to relevant comments. As is standard practice, these summaries convey the substance of the comments made, but do not necessarily quote the comments verbatim. Comments are organized by subject matter and generally parallel the chapter structure of the DSEIS. Where more than one commentator expressed similar views, those comments have been grouped and addressed together. It is noted that many of the comments offered substantive concerns, issues, and recommendations about the overall plan itself, but not specifically on EIS technical issues. In these instances, the responses include either an acknowledgment of the comment (“Comment noted.”) or an indication that the comment raised issues beyond City Environmental Quality Review (CEQR) and the technical scope of the DSEIS.

B. LIST OF ORGANIZATIONS AND INDIVIDUALS WHO COMMENTED ON THE DRAFT SCOPE OF WORK**COMMUNITY BOARD**

1. Queens Community Board 3, oral comments by Giovanna Reid (CB3)

ORGANIZATIONS

2. Auburndale Improvement Association, written submission by Henry Euler dated July 10, 2013 (Auburndale)
3. Bay Terrace Community Alliance, oral comments by Phil Konigsberg (BTCA)
4. International Union of Operating Engineers, Local 14, oral comments by James Conway (IUOE)
5. Jackson Heights Beautification Group, oral comments and undated written submission by Edwin Westley (JHBG)
6. Kew Gardens Improvement Association, oral comments by Sylvia Hack (KGIA)

¹ This entire chapter is new to the FSEIS.

Willets Point Development

7. New York League of Conservation Voters, oral comments and written submission dated July 10, 2013 by Dan Hendrick (NYLCV)
8. New York City Park Advocates, oral comments by Geoffrey Croft (NYCPA)
9. Queens Civic Congress, written submission dated June 6, 2013 by Richard Hellenbrecht, read by Phil Konigsberg (QCC)
10. Urban Justice Center, oral comments by Edward W. De Barbieri (UJC)
11. Willets Point Sunrise Co-operative, oral comments by Marco Neira (Sunrise-Neira); oral comments by Sergio Ageri (Sunrise-Ageri)
12. Willets Point United, oral comments and written submissions (July 10, 2013 and July 19, 2013) by Gerald Antonacci (WPU-Antonacci)¹; oral comments by David Schwartz (WPU-Schwartz); written submission dated July 17, 2013 by Michael B. Gerrard (WPU-Gerrard); written submission dated July 10, 2013 by Brian Ketcham, P.E. (WPU-Ketcham)

INTERESTED PUBLIC

13. Joseph Ardizzone, affected resident and member of Willets Point United, oral comments (Ardizzone)
14. Benjamin Haber, oral comments and written submissions dated July 5, 2013 and July 12, 2013 (Haber)
15. Irene Presti, affected property owner and member of Willets Point United, oral comments (Presti)
16. Heather Russell-Loux, written submission dated July 17, 2013 (Russell-Loux)

C. COMMENTS AND RESPONSES

GENERAL

Comment 1: We support the project; it will provide 20,000 sustainable jobs and apprenticeship training opportunities. (IUOE)

We support the project. In addition to the jobs it will create and the economic investment it will make in Queens, this project presents what is probably the best hope to finally improve the water quality in Flushing Creek and Flushing Bay, while creating new access points and green spaces for residents. (NYLCV)

Response: Comment noted.

Comment 2: This plan is robbing me of my past, my present and my future. (WPU-Ardizzone)

Response: Comment noted.

¹ Written submission included developer RFP responses as an attachment.

APPROVAL PROCESS

Comment 3: The Willets Point parking lot would enable the applicants to transfer the Mets CitiField parking lot to Willets Point so the area can be made available for a 1.4 million square foot shopping mall at CitiField. This mall has nothing to do with the 2008 approved plan, nor any connection with CitiField. This is a change in land use and the applicant must comply with current law and undertake the Uniform Land Use Review Procedure (ULURP) for the mall. (Haber)

The approval to allow a parking lot on the Willets Point District is just to facilitate development of a mall. It would be both inappropriate and an abdication of the Commission's responsibilities for the Commission to narrowly consider just the parking lot application, while disregarding the specific intended larger effect of that application—the construction of a huge shopping mall on parkland. (WPU-Antonacci)

Response: The proposed project will result in development in the 61-acre District as substantially similar to the project described and analyzed in the 2008 Final Generic Environmental Impact Statement (FGEIS) and subsequent technical memoranda. The proposed project also includes the development of land beyond the District, at Willets West and south of Roosevelt Avenue. The DSEIS assesses the potential for impacts on all land comprising the proposed project including assessment of the potential for impacts on the surrounding neighborhoods resulting from the development in the District as well as development from additional parcels beyond the District.

ULURP is not required for a change in land use as described by the commenter. As it is proposed to be constructed on mapped parkland, the portion of the development outside the Special Willets Point District—including the development on Willets West—is not zoned, is not subject to the regulations of the Zoning Resolution, and does not require approval pursuant to ULURP. The only portion of the proposed project subject to ULURP is the proposed interim parking area and recreational use within the Special Willets Point District. Nonetheless, as discussed above, this Final Supplemental Environmental Impact Statement (FSEIS) assesses the potential for impact of all components of the project, including on proposed project land not subject to ULURP.

Comment 4: Please reject this application. Let the city issue a new Request for Proposal (RFP) and let the respondents conform with the parameters and goals of the project that was approved in 2008. (WPU-Antonacci)

Response: This is not a comment on the DSEIS. However, the proposal for the initial 23 acres fulfills the first phase of the original vision for the area and more. The developer proposal, in its final form, conformed fully with the vision, addressing two key challenges—the absence of development activity in the

general area surrounding Willets Point, and the need to remediate environmental contamination on a large portion of the district. The proposed project would allow for initial uses in the immediate area that are critical to create the economic environment necessary to achieve the full vision at Willets Point.

Comment 5: Public participation in the environmental analysis is a farce. Over the past five years more than a thousand pages of comments have been generated on the FGEIS, the Access Modification Report (AMR), the Phase 1 Report, the Van Wyck Ramp Environmental Assessment (EA) and the Final Scoping Document for Willets Point “West.” Thousands of comments have had no effect on the outcome of these analyses. Comments were deemed as not requiring a response, given a meaningless response, or the response simply disagreed with the commenter. In 2010, there was a meeting with the Federal Highway Administration (FHWA), the New York State Department of Transportation (NYSDOT), the New York City Economic Development Corporation (EDC), and a host of lawyers where WPU identified problems so significant that it forced a two-year delay in the Willets Point project. The project presented one story in the FGEIS and another in the Environmental Assessment for the Van Wyck Ramps. The EA report hid traffic volumes to under-report project impacts. (WPU-Ketcham)

WPU discovered that the draft AMR relied on traffic presumptions that differed dramatically from those contained in the FGEIS. Thereafter, NYSDOT and FHWA did not approve the draft AMR, but rejected it; restructured the ramp approval process to require an Environmental Assessment prior to approval of any AMR, and sent EDC back to the drawing board to draft a new AMR, which took two years. (WPU-Antonacci)

Response: The public comment process for the GEIS, AMR, and this FSEIS review was extensive. As a result of public input, comments were considered by the lead agencies and these documents were revised, where appropriate.

The Draft AMR referred to in the comment was a preliminary draft, and the traffic analysis contained therein underwent substantial revision, culminating in the traffic analysis contained in the EA. The two-year length of time that was required to complete and issue the EA for public comment suggests the rigorous nature of the EA’s review by NYSDOT and FHWA.

It should be noted that the EA and FGEIS use different methodologies. The EA, in evaluating the proposed access modification project, is a National Environmental Policy Act (NEPA) document and thus was guided by NYSDOT and FHWA procedures for assessing potential impacts from highway projects. This assessment is more regional in its approach and focused on highway systems. The FGEIS was developed in consultation with the New York City Department of Transportation (NYCDOT) and in accordance with the *CEQR Technical Manual*. Second, because the proposed access modification project

looks at the highway system, there were different data needs than used in the FGEIS. A complete data collection program was developed to record traffic volumes along highway and local roads, which resulted in a new base of traffic for evaluation in the EA. Third, each methodology used a different growth to forecast the future No Build condition. While the FGEIS used a conservative standard flat rate, as defined in the *CEQR Technical Manual*, the EA, being more regional in nature and focused on the highway system, used the regional long-range planning model. Fourth, the FGEIS follows the *CEQR Technical Manual*, and considers traffic flow on a localized level to determine site-specific impacts, whereas the EA analyzes traffic on a more regional level. Fifth and last, projected growth associated with both the proposed project and other local developments as defined in the FGEIS are the same for both the EA and FGEIS.

Comment 6: The Commission has treated unequally those who would provide proxy testimony opposed to the Willets Point development, versus those who would provide proxy testimony in favor of the Willets Point development. (WPU-Antonacci)

Response: The New York City Planning Commission accepted all oral and written testimonies that were offered at the public hearing. All testimony that was submitted within the public comment period was accepted for consideration by the lead agency. The comment period remained open for 10 days beyond the hearing date pursuant to New York State Environmental Quality Review Act (SEQRA) regulations. Thus, all comments on the DSEIS were included in the record.

RFP, BIDDING DOCUMENTS, LEASE TERMS, COMMUNITY INVOLVEMENT

Comment 7: Gone is the pledge to provide workers with a living wage. (Presti)

A living wage for retail workers has been pushed off into the indefinite future. (WPU-Schwartz)

Response: This is not a comment on the DSEIS. Living wage provisions are not a socioeconomic impact issue under CEQR guidance and, thus, are outside the scope of this project's environmental review.

Comment 8: The City used the threat of eminent domain to grab land that will now be used as a parking lot. What the City is getting for its overall investment of about \$500 million is a mall and a parking lot. Everything else is smoke and mirrors. (Presti).

The proposed development is nothing more than a land grab by private developers with deep pockets whose claims of improving the community are questionable at best. The current development is not to benefit the community

Willets Point Development

but solely for the benefit of those who wish to attend events at CitiField. (Russell-Loux)

Don't believe for a second if there is a chance to use eminent domain they won't use it. The City is using inappropriate, un-American tactics for private enrichment. (WPU-Antonacci)

I voted against the proposal in 2008, and am still opposed because eminent domain is still an option. (BTCA)

Response: This is not a comment on the DSEIS. The City uses eminent domain sparingly and only as a last resort. Since the 2008 approval of the Plan, the City has undertaken outreach and has been negotiating with property owners in the District. Through negotiated acquisition, the City has acquired, or is in contract to purchase, approximately 95 percent of the land area within the proposed Phase 1A/1B footprint (Assemblage Option 2). The City will continue its outreach efforts as the development of the District moves forward. The City's acquisition of the land area within the District would serve to meet the goals and objectives of the Willets Point development plan, to remediate and transform the area surrounding CitiField into a thriving new neighborhood and regional destination.

Comment 9: There was no consultation with the community boards on the developers' plan. (CB3)

The community board was not included as part of the developer selection process. Had there been community board input, this shopping mall project would not have been selected. (Haber)

Community Board 9 was not consulted and involved in the proposals. (KGIA)

The decision to select the plan of Sterling/Related to the exclusion of all others was made by the City administration via a process that violated written guarantees within the Willets Point FGEIS and elsewhere, that the Willets Point Advisory Committee would participate in and help to guide developer selection. (WPU-Antonacci)

Response: Comment noted. Community Board participation in developer selection is outside the scope of this project's environmental review. The ULURP application and the DSEIS were referred out to Queens Community Board 7 for review pursuant to the ULURP rules. Furthermore, Queens Community Board 3 requested and was sent the ULURP application materials for review.

Comment 10: The 2008 approvals of the proposed Willets Point development—procured in the context of lobbying so illegal that it required the restructuring of EDC to ensure it will never happen again—still are the basis of the proposed Willets

Point Phase 1/Willets West development being considered now. (WPU-Antonacci)

Response: This is not a comment on the DSEIS and is outside the scope of this project's environmental review.

SUBSIDIES

Comment 11: Other developers would be happy to get the land for \$1 and receive \$99 million in taxpayer subsidy. (Haber)

The City has decided to gift the property to Related and Sterling Equities for \$1. (Presti)

They've gotten 23 acres for \$1. That's \$250 million dollars in land for \$1. They've gotten \$100 million grant, \$20 million in sales tax, and it just goes on and on. (WPU-Antonacci)

The City is taking over land from private owners to build a parking lot, just so a private developer can buy parkland for \$1 to build a mall. \$200 million has been spent to purchase property to be given to developers for \$1, with a \$99 million subsidy to the developer. (WPU-Schwartz)

Response: Business terms are beyond the scope of this project's EIS. The contamination of the Willets Point land in conjunction with the requirements to remediate the land renders it of only nominal value. The City has a certain amount of funding available for this project that has been allocated towards demolition, remediation and infrastructure costs in order to expedite the project. The Queens Development Group plans to invest \$3 billion to remediate the property and build a new mixed-use community in its place. A Request for Proposals (RFP) was issued by EDC providing an opportunity for developers to submit proposals for development of Phase 1 of the Willets Point Development Plan. No other developers responded with proposals that achieved the development of Willets Point according to the goals of the plan without requiring subsidies that far exceeded the current proposal.

Comment 12: The developers are getting a \$99 million grant for cleanup and \$20 million in sales tax exemptions. Any profits from that mall go directly to Sterling and Related, and the remediation is paid for by the tax paying people. (WPU-Antonacci)

Response: The business terms are beyond the scope of this EIS. Please refer to response to Comment 7 regarding the City's commitment to fund the environmental cleanup and required infrastructure to support the development.

VAN WYCK RAMP APPROVALS

Comment 13: The highways cannot be enlarged. There's never going to be ramps. The housing is never going to happen. (Haber)

The affordable housing and new schools will be delayed and contingent on the construction of the Van Wyck ramps. (CB3)

The Van Wyck ramps and the highway ramps are never getting built. A clause in the contract says that if Sterling and Related want to build them, they can build them by themselves. There's also a line in the contract that says under no circumstances is it to be assumed that the City is obligated to build the ramps. (WPU-Antonacci)

Had it been stated back in 2008 that the affordable housing would be put off for 10 years on some speculation that maybe our ramps will be built off the Van Wyck Expressway, this plan would never have been approved. This is a bamboozle. (WPU-Schwartz)

When the City put forward its original plan, it said that it would provide ramps off the Van Wyck to mitigate the tens of thousands of weekly car and truck trips. Now, even with an added 1.4 million square feet of mall, there are no immediate plans to build those ramps. And without them, heaven help those trying to navigate streets like Roosevelt Avenue, near where my property lies today. (Presti)

Response: The City sought and received approval for the Van Wyck Expressway ramps and is committed to funding the ramps in order to maximize the full allowable development in the first phase, including affordable housing, and ensure the development of future phases as well as to mitigate impacts of development. The Queens Development Group is not contractually prevented from building the ramps without waiting for the City to move ahead with its plans to construct them and it would have to meet any future obligations imposed by FHWA and NYSDOT before it could commence with their construction. The design and construction of the ramps is a complex process that, like any other large infrastructure project, will require extensive coordination from multiple governmental agencies. As described in Chapter 14, "Transportation," and Chapter 21, "Mitigation," the DSEIS has addressed and considered the impacts of the Willets Point development project, including the proposed development on the Willets West portion of the project site.

Comment 14: The City still refuses to disclose anything about the cost of the Van Wyck ramps, though they say the City has agreed to pay for them. It appears that the traffic methodology used for the DSEIS was similar to that employed by the City in the original FEIS. That FEIS also projected terrible traffic consequences, though not nearly as bad as those in the DSEIS (at least in part because of the

considerable enlargement of the project). The City then abandoned that methodology when it prepared an AMR in its successful effort to persuade NYSDOT and FHWA to approve the Van Wyck ramps. Now the City is going back to its original methodology. In view of this new information, the prior approvals by the NYSDOT and the FHWA are invalid, and those agencies need to undertake a fresh review under NEPA. (WPU-Gerrard)

Response: The comment appears to relate to the scope of the EA and Finding of No Significant Impact (FONSI) issued by FHWA, but not to the DSEIS. For the reasons noted in the response to Comment 5, it should be noted that FHWA requires a different analysis of modified or new access to and from the existing highways network than required under SEQRA or CEQR. The appropriate methodologies were used for the respective approval processes.

The AMR was approved by FHWA, upon recommendation for approval by NYSDOT. The Van Wyck Ramp project analyzed in the EA and the AMR, and discussed in FHWA's issuance of a FONSI, have not changed. The Willets Point development project is a background development project for the EA and changed after FHWA had issued the EA, FONSI and AMR. This DSEIS addresses a change to the schedule and scope of the background project. If the proposed changes to the Willets Point development project are approved, FHWA will be apprised of the changes to the background project as they relate to the EA, FONSI and AMR. As described in the Van Wyck Ramp EA, capital construction costs are estimated to be approximately \$50 million.

Comment 15: Why did not EDC and/or the developer revise the EA for the Van Wyck ramps? The DSEIS reports the Willets "West" Mall will be adding about 28,000 car and truck trips to the WP area (and a great deal more if their assumptions are wrong) for average weekdays. Adding the Willets "West" Mall traffic results in significant differences in background traffic that will affect travel conditions with the ramps. These trips, as many as 3,000 an hour entering or leaving the Willets "West" Mall, will get onto nearby expressways affecting the baseline conditions examined to determine the environmental impacts of the Van Wyck ramps to be constructed. The DSEIS itself reports that the Willets "West" Mall will produce significant traffic impacts on surrounding expressways requiring costly mitigation (should funds be available) (DSEIS Page 21-27). The EA must be updated. (WPU-Ketcham)

Response: FHWA requires a different analysis of modified or new access to and from the existing highways network than is required under the SEQRA/CEQR process. Thus, the AMR framework includes travel demand modeling and simulation to understand the potential effects within a larger regional area and much further into the future than is typically done in the SEQRA/CEQR process. Whereas the project's environmental assessment of project-generated traffic impacts conforms with the *CEQR Technical Manual* guidance of using Highway

Capacity Manual (HCM) (version 5.5) procedures, accounting for traffic generated by other nearby development projects, and applying prescribed annual background traffic growth rate, the AMR framework utilized the Best Practices Model (BPM), which is a travel demand forecasting model for the New York Metropolitan Transportation Council (NYMTC) region. The BPM macro-model comprises data and projections from 28 counties in the tri-state region. The traffic analysis performed for the AMR analyzes the regional highway impacts of the ramps themselves, whereas the potential impacts that are analyzed in the DSEIS are associated with the proposed project modifications on a more localized basis. Thus, the methodologies and inputs for both analyses are different with no inherent discrepancies or data oversight in the impact assessments between the Willets Point DSEIS and the AMR documents. The focus on the local effects of the Plan and the regional effects of the proposed Willets Point ramps on the Van Wyck Expressway necessitate the use of different modeling methodologies and time horizons. If the proposed changes to the Willets Point development project are approved, FHWA will be apprised of the changes to the background project as they relate to the EA, FONSI, and AMR.

RELOCATION/ RELOCATION ASSISTANCE

Comment 16: The DSEIS still does not identify relocation sites for the remaining businesses that have not agreed to sell. The Response to Comments on the Draft Scope (page 20) says that the City is still working on this, but there is no indication that any progress has been made for the last several years. The original EIS assumed that all the businesses could be readily relocated. Five years later relocation sites have not yet been found for my clients and others. The Supplemental EIS must acknowledge this reality. (WPU-Gerrard)

The City has been trying to push us out of Willets Point. They've arrested 54 of the owners and workers. We want to know where we're going to relocate, and how the City is going to follow through. We found land where we can relocate as a group, but nobody is taking us seriously. Our interests are being pushed behind others. (Sunrise-Ageri)

Response: Since the approval of the 2008 Plan, the City has been undertaking an extensive outreach effort to the existing businesses and their workers. EDC has contracted with The Cornerstone Group, a business relocation expert, to provide relocation assistance and advisory services free of charge to affected tenant businesses on city-owned property in the Phase 1 footprint of the District. Cornerstone has been providing services at Willets Point since they were initially engaged by EDC in 2008, and has maintained a regular presence in the District since that time. Cornerstone commenced its most recent round of outreach to affected Willets Point tenant businesses on City-owned property in September 2012 and their outreach in Willets Point is ongoing. To date, Cornerstone has identified

over 120 potential relocation sites (for rent and sale) with a range of sizes and prices. They have been in contact with all tenant businesses on City-owned property in the Phase 1 footprint who are on record with the New York City Department of Housing, Preservation, and Development (HPD) (as landlord) and have presented each of them with multiple potential relocation sites over the past several months. They have taken many business representatives on site tours, and as instructed by businesses, made a number of offers on their behalf. Cornerstone is actively working with individual businesses, as well as businesses who have expressed a desire to co-locate in clusters. The identification of potential sites for relocation will not be provided in the SEIS, as the public release of such information could jeopardize negotiations with existing property owners. The DSEIS provides a reporting of the businesses that remain on the project site, and the anticipated timing of their displacement. The DSEIS also clarifies that the proposed project would result in the same direct business displacement identified and analyzed in the 2008 FGEIS and subsequent technical memoranda.

Comment 17: Cornerstone recently has been helpful in analyzing the market and finding sites to relocate to. Unfortunately, the task is to relocate all the businesses. They benefit from co-location, they're asking to be relocated together, and Cornerstone hasn't been able to help us get to that point. We have approached EDC, the developer, and we have worked with Councilmember Ferreras to get a relocation plan that's meaningful and workable for the members of the [Sunrise] cooperative. Unfortunately, we don't have a viable relocation plan, and that's a serious flaw in this project. The City has given no commitment to help with a viable relocation plan. Our concern is that the displaced businesses will die. (UJC)

We would like to see our members relocated as a group, similar to the Fulton Fish Market model. (Sunrise-Neira)

These businesses are all interrelated with each other, and that's why it's so important for the relocation that these businesses are kept together. And there is really no plan to do that. (WPU-Schwartz)

The 79+ businesses that are not members of the Sunrise Corporation are just as dependent upon co-location for their future survival as are the members of the Sunrise Corporation. (WPU-Antonacci)

Response: As described above, EDC has contracted with The Cornerstone Group, a business relocation expert, to provide relocation assistance and advisory services free of charge to affected tenant businesses on City-owned property in the Phase 1 footprint of the Willets Point District. Cornerstone commenced its most recent round of outreach to affected Willets Point businesses on City-owned property in September 2012 and their outreach is ongoing. Cornerstone

Willets Point Development

is actively working with individual businesses, as well as tenant businesses who have expressed a desire to co-locate in clusters.

Comment 18: LaGuardia Community College's retraining program doesn't work. The workers already have jobs, they're running businesses. All they're asking for is to be relocated somewhere else where they can continue to operate their business. (UJC)

Response: This is not a comment on the DSEIS. However, the Willets Point Worker Assistance Program (WAP), administered by LaGuardia Community College on behalf of EDC, has successfully provided a variety of services at no cost to Willets Point workers who have enrolled in the program. These services include job training, job placement, General Education Development (GED) test preparation, referrals to counseling for immigration issues, as well as educational and vocational classes. To date, over 600 Willets Point workers have registered with the WAP, and 470 have taken advantage of program services. On a weekly basis, LaGuardia Community College identifies potential job opportunities, which are provided to Willets Point workers who have enrolled in the program and who have expressed interest in finding employment beyond the District. LaGuardia Community College has successfully placed over two dozen participants in the WAP into jobs in various industries.

HOUSING

Comment 19: The housing is never going to be built. Phase 2, with the promise of 35 percent for affordable housing, has a scheduled completion of 2032. (JHBG)

Gone is the housing, pushed way back into the distant future with no guarantee that it will ever get built. (Presti)

Affordable housing has been pushed off into the indefinite future. (WPU-Schwartz)

The housing won't get built. There's a \$30 million out clause. And if the city doesn't build the ramps, they don't have to build the housing. Without the ramps, only Phase 1A (essentially, the mall) can be built. (WPU-Antonacci)

The estimated cost is \$3 billion for Phase 1A and 1B, but they have an out clause that costs \$35 million. These developers are kicking the can down the road. (JHBG)

Response: The purpose of the SEIS is to analyze the potential environmental impacts of the project as proposed. The remediation of the Willets Point Phase I area, the development of Willets West and the activation of 126th Street combined will catalyze further development of the area in the future phases, including affordable housing. The RWCDs for Phase 1B and Phase 2 of the project include the development of a mixed-use community that contains thousands of

housing units, hundreds of which are anticipated to be affordable housing units. The residential uses will require the supportive development of the retail, office, school, community facility, and open space uses that will surround it. As such, plans do not currently call for the construction of stand-alone residential uses in this area without the other uses that would support such housing. It should be noted that affordable housing is one of a number of important goals for the proposed project and is anticipated to commence in Phase 1B.

LEASE FOR PARKLAND

Comment 20: The 1961 Legislation does not permit any shopping mall. Administrative Code 18-118 explicitly states that any moneys gained from a temporary lease on the property must go back into the property. The intention of the law was not to allow any project to make a permanent claim on parkland or its facilities. The parkland we are talking about here today was never alienated as required under state law and no replacement for this parkland is being proposed. If the 30+ acres of parkland they are attempting to seize for the project were no longer needed for parking for the Mets, then it should revert back to its original use. (NYCPA)

The DSEIS does not satisfactorily address the comments raised by a number of commenters that the land that the City acquired for park purposes cannot lawfully be utilized for a shopping mall and associated parking, in particular there is no, or insufficient, legislative authorization to abrogate the public trust doctrine in this instance, and that the Administrative Code does not permit the City to lease or sell the parkland at issue to construct a mall. (WPU-Gerrard)

There is no plan to replace the 30.7 acres of parkland. Urban Justice Center has issued an opinion that there is nothing in the 1961 legislation that even hints of the building of a mall. It does address possible development but only as it relates to a sports venue. (JHBG)

The mall is taking away 30 acres of parkland. A shopping mall on public parkland is not appropriate. The Commission is being asked to approve a ULURP application to facilitate construction of a mall that is unlawful and cannot occur. (WPU-Antonacci)

This is a radical change in land use from a parking area to a huge shopping mall and not contemplated in the 1961 lease of the CitiField property. There is no obligation to replace parkland. (Haber)

The 1961 legislation doesn't specifically allow a mall to be built on the Willets West site. (UJC)

Any change in use should be subject to State alienation legislation. As parking lots they could be easily returned to public space as open space if they were no longer needed, but the introduction of a massive steel and concrete mall to these

western parking lots would permanently destroy a public park amenity the community should enjoy for recreation and fun. (QCC)

Flushing Meadows Corona Park is being murdered piece by piece. If it's so wonderful to have these things, I don't understand why Central Park or Prospect Park never get looked at. How is it that 30 acres or so of property is being transferred for the use of a mall? That is outrageous. (KGIA)

Community Board 3 is opposed to constructing a mall on active parkland. (CB3)

Taking parkland from the residents of Queens is outrageous. (WPU-Schwartz)

Response: Comments regarding the permissibility and appropriateness of building on Willets West are not comments on the DSEIS. Nonetheless, the City has previously received the legislative authority to enter into leases for the use of the portion of the project here known as Willets West in furtherance of entertainment, trade and commerce for the benefit of the City, and therefore additional parkland alienation approval is not required for the proposed project. Specifically, Section 18-118 of the Administrative Code (originally codified as Section 532-15.0) was enacted by the New York State Legislature under Chapter 729 of the Session Laws of 1961 and authorizes the City to enter into leases, contracts and other agreements for a multitude of purposes, including for any purpose which is of such a nature so as to foster or promote amusement, entertainment or the improvement of trade and commerce. The statute declares that such purposes, as well as others set forth in the statute, are for the benefit of the people of the City and for the improvement of, among other things, their health, welfare, recreation and prosperity, and for the improvement of trade and commerce, and are further declared to be public purposes. The proposed use fits within the uses allowed by the above statutory provision.

FRAMEWORK FOR ANALYSIS

Comment 21: The DSEIS relies on inaccurate “No Action” baseline assumptions that the existing uses on the project site would be maintained. The City intends, and is already taking steps, to evict tenant businesses that operate throughout the Willets Point Phase 1 property. The City has not disclosed what will become of City-owned Willets Point property in the event that the City's proposed Willets Point development does not occur, but it must do so now in order to ensure an accurate SEIS analysis. The SEIS must also assess what owner-development would likely occur, even without action on the part of the City, now that the sewer main lines along 126th Street directly adjacent to the Willets Point property exist. (WPU-Antonacci)

Response: The DSEIS assumption that the existing uses would be maintained in each of the three No Action scenarios is conservative. This framework for analysis allows for the displacement of Willets Point businesses and workers—as well as the

project's effects on traffic, parking, transit, and pedestrians—to be fully accounted for. The assumption of any current owner development in the No Action scenario would lessen the effects attributable to the proposed project.

CEQR methodologies require analysis of the incremental difference between the impacts of the development scenario where the City has taken action versus one where the City has not taken action. This SEIS conservatively assumes that if the City does not take action, existing conditions would continue. In addition, it is a reasonable assumption that development according to zoning would not proceed without City action even after the construction of sanitary sewers as significant assemblage, environmental remediation and change of grade would be required prior to development.

SOCIOECONOMICS

Comment 22: More tenant businesses are impacted than the Commission has been led to believe. The public hearing on July 10, 2013 included testimony from representatives of the Sunrise Corporation, an association of approximately 60 tenant businesses. It is our understanding that some of those 60 businesses are located within Willets Point but beyond the Phase 1 area that would be affected if the present Sterling/Related plan succeeds. In the recent eminent domain case pertaining to a first phase of Willets Point property that was substantially similar to the Phase 1 that is presently contemplated, the City's "Response to EDPL Comments" dated May 2011 acknowledged that 139 auto-related businesses in the first phase would be displaced. (WPU-Antonacci)

Response: The commenter is referring to testimonies related to different actions. The EDPL process, which has been subsequently withdrawn, only related to properties within the Phase 1 area, whereas this CEQR record addresses the redevelopment of Phase 1 and Phase 2 of the Special Willets Point District. As the DSEIS discloses, all existing businesses (260) in the District would be displaced by the full build year of 2032.

Comment 23: The DSEIS makes inconsistent statements about retail capture rate. The application claims that the project would capture retail spending in the surrounding suburbs yet would not affect the 5-mile study area. If the second statement is correct then they will put existing Queens malls into bankruptcy, like Atlas Mall in Middle Village. (JHBG)

Response: The DSEIS is consistent in its presentation of retail capture rates. The retail expenditure analysis conducted as part of the preliminary assessment indicates that the 5-Mile Primary Trade Area is currently under-retailed, with an overall retail capture rate of 61 percent. In the future with the proposed project, the retail capture rate would increase to 77 percent. That the capture rate in the future with the proposed project would remain well below 100 percent (the

CEQR threshold requiring a detailed analysis of indirect business displacement due to retail market saturation) indicates that there would continue to be ample retail expenditure potential in the 5-Mile Primary Trade Area to support the both the proposed project, existing retail, and retail introduced in the future independent of the proposed project.

As noted in the DSEIS, The Shops at Atlas Park has struggled to attract and retain tenants in recent years, in part due to its relative isolation and the lack of an anchor retailer. While shopping centers like Atlas Park may continue to struggle in the future, such troubles would be unrelated to the proposed project, as the capture rate analysis indicates that the retail market in the 5-Mile Primary Trade Area (and in Queens as a whole) would not approach saturation in the future with the project.

Comment 24: A mall will destroy hundreds of mom and pop businesses and surrounding neighborhoods, introducing potentially devastating competition to existing struggling malls such as the Shops at Atlas Park, Rego Park, and Queens Center Mall. (QCC)

There was no discussion of the displacement of the residents and the businesses [in Community Board 3]. We have small mom and pop stores that are going to be impacted by the proposed plan. (CB3)

The mall will harm hundreds of small businesses on Northern Boulevard, Roosevelt Avenue, Downtown Flushing, the shops on 20th Avenue, and Rego Park. (Haber)

The disruption to the community as well as to the users of Flushing Meadows Corona Park by the Willets Point West proposed development cannot be stressed enough. Businesses and workers will be displaced. (Russell-Loux)

What will happen to local businesses when the mall is completed? (Auburndale)

Response: The DSEIS followed *CEQR Technical Manual* guidelines in analyzing the potential for significant adverse impacts to neighborhood retail concentrations due to competition. Based on CEQR guidelines, if the capture rate for specific, relevant categories of goods would exceed 100 percent in the future with the proposed project, it may have the potential to saturate the market for particular retail goods and a detailed analysis is warranted. As indicated in the DSEIS, capture rates for each of the retail categories analyzed would remain below 100 percent in the future with the proposed project, indicating that the project would not have the potential to saturate the market for particular retail goods and that a detailed analysis was not warranted. Nonetheless, to maintain consistency with the analysis performed for the FGEIS, a detailed analysis of indirect business displacement due to retail market saturation was conducted. This detailed analysis focused on local grocery stores, which generally serve as anchors for local retail concentrations, as well as on anchors in regional retail centers,

including movie theaters and restaurants, because the Willets West component of the proposed project would constitute a major new shopping and entertainment center. The detailed analysis confirmed that the proposed project would not have a significant adverse impact due to indirect business displacement.

Comment 25: Can the project east of 126th Street accommodate nearly 600,000 square feet (sf) of local retail and, if so, how? What is the basis for assuming 593,000 sf of local retail east of 126th Street? This assumption appears very high for a project with just 5,850 residences, approximately 12,000 residents (plus workers and others, although local retail is nowhere close to the Willets “West” Mall and entertainment center and additional retail would be redundant for the Willets Point “West” shopping mall). Moreover, assuming stores are 60 feet deep, the developer is looking at installing nearly two miles of storefront space in the original Willets Point project. We don’t think there is enough space for this much local retail. And, with all this local retail using curb space, where will 657,000 sf of additional destination retail go if all frontage is occupied by local retail? So, what’s the point of so much local retail? Considering that just 15 percent of shoppers are assumed to arrive by auto for local retail we believe this is the developer’s way of hiding auto trips and minimizing traffic impacts. We are convinced that more than half of this “local retail” space will, in fact, end up as destination retail. The DSEIS must be revised to account for this worst case condition. (WPU-Ketcham)

Response: The DSEIS used the full available square footage under the District approvals for a reasonable worst-case development scenario (RWCDs) impact analysis. Further, there is a practical limit to the amount of destination retail that a single area can accommodate. The 2008 FGEIS assumed that up to 1.55 million square feet of destination retail would be developed within the District. Since the proposed project would introduce an additional one million square feet of destination retail to the area, and considering the amount of destination retail already existing in nearby downtown Flushing, it was assumed that the District could not reasonably accommodate more than 600,000 or 700,000 square feet of additional destination retail, due to reasonable limits on the number of large destination retailers that could viably locate there. The potential for big box stores would also be constrained by the building footprints imposed by the special district’s regulations, as well as by market conditions. The proposed project’s local retail offerings east of 126th Street would serve a substantial and diverse user base, including most notably the 5,850 households introduced by the project who would add approximately \$93.7 million in expenditure potential within the local economy. The proposed local retail space also would draw customers from the office, hotel, community facility, convention center, and school uses that would be introduced by the proposed project, as well as game-day Mets patrons and patrons of the area’s parks. In areas of New York City

where local retail stores serve multiple consumer groups it is not uncommon to find the mix of uses proposed. In addition, these local retail uses could include mid-size supermarkets, grocery stores, restaurants, and other neighborhood amenities that would be essential to the new community that would be created within the District. Many of these could be substantially more than “60 feet deep” and occupy more than just “storefront space” within the future District buildings. Hence, the commenter’s assertion that “more than half of this local retail space will, in fact, end up as destination retail” is unfounded.

OPEN SPACE

Comment 26: We are very concerned about the three proposed projects to be constructed on parkland at Flushing Meadows Corona Park: expansion of the National Tennis Center, building of a soccer stadium, and construction of a huge mall. We oppose all three. The proposed 1.4 million-square-foot mall would be constructed on parkland, which is sacrosanct and should be off limits to any private development. The asphalt on the unused part of the parking lot to the west of CitiField should be removed and trees and other vegetation should be planted in order to make it look more like a park once again. (Auburndale)

I strongly oppose any proposed development which will diminish the green space now available in Flushing Meadows Corona Park. The proposed Willets Point West shopping mall can not be viewed in a vacuum but as part of the larger assault on Flushing Meadows Corona Park. There are currently three proposals to permanently annex public parkland for private use. The land which is now the old Shea Stadium parking lot was formerly green space which should revert back to green space if it is no longer needed for the original purpose for which it was annexed. The land should not be allowed to be transferred further. In fact, the very thought that it is acceptable to confiscate any amount of park space for the building of a shopping mall, as well as the other proposed developments, i.e. soccer stadium, increasing the USTA’s allotment of park space, speaks volumes about the current mayor and our politicians’ disregard for minorities and lower income residents of our community. Such a proposal would never have been tolerated much less suggested with regards to Prospect Park or Central Park. Apparently it is fair game to trample on the residents of Queens. (Russell-Loux)

Response: The three projects described are separate projects with separate approval processes. The DSEIS accounts for the potential cumulative impacts of these projects. Further, the mapped parkland on which the Willets West portion of the project was alienated in 1961 for economic and commercial activities and was never built as a green space open to the public. This area is currently, and has since 1961, been under a long-term lease to a private entity for uses to which public access is limited and controlled.

HISTORIC AND CULTURAL RESOURCES

Comment 27: We object to the demolition of the Empire Millwork Corporation building, which is on the State and National Registers of Historic Places. (JHBG)

Response: Comment noted. The effects of the proposed project on the Empire Millwork Corporation Building would be the same as those disclosed in the FGEIS; potential mitigation measures have been disclosed. However, demolition of the building would occur in Phase 2 of the project, approximately 11 years later than previously assumed in the FGEIS. The DSEIS considered the potential retention of this structure, as part of the No Unmitigated Significant Impacts Alternative. As discussed in Chapter 22, “Alternatives,” although demolition of the building could be avoided through adaptive reuse, exterior elements would still need to be upgraded to comply with building codes and noise attenuation requirements, and flood protection measures such as gates or pumps would be required to comply with flood insurance requirements. Furthermore, this alternative would reduce the footprint of any new development, which would result in greater density in the remainder of the District, fewer housing units, less open space, or some combination of these possibilities.

HAZARDOUS MATERIALS

Comment 28: I have hired a chemist to test my property. I don’t believe that the toxicity is what they say. I will try to hand in written supporting submission by close of comment period. (Presti)

Response: No such documentation was submitted by the commenter within the comment period, and it is unclear where the commenter’s property is located. Nonetheless, hazardous materials testing pursuant to a City- and State-approved testing protocol will be conducted throughout the area of the proposed project prior to remediation.

Comment 29: A major rationale for the City’s insistence that the entire project be done at once, without phases, was that soil contamination all needed to be remediated at once. The City has now decided to adopt a phased approach. The FSEIS should explain this change in position, and how it envisions that contamination will be addressed on a phased basis. (WPU-Gerrard)

Response: The hazardous materials analysis of the DSEIS considers the proposed development of the District in phases. As discussed in Chapter 10, “Hazardous Materials” of the DSEIS, Phase 1A of the proposed project would incorporate a comprehensive investigation of the entire District with associated remedial actions that would remove areas of significant contamination and prepare the District for subsequent development.

While some subsurface contamination would likely remain after completion of each element/phase of development (e.g., historical fill materials underlying developed sites and contamination in nearby areas that would not be cleaned up until later), each new development would include appropriate engineering controls (e.g., capping to prevent exposure to underlying soils, groundwater monitoring and controls at development site boundaries, and vapor barriers with active or passive sub-slab depressurization systems beneath occupied buildings). Following development, measures including the mandatory implementation of appropriate health and safety procedures and additional institutional controls (beyond those requiring investigation and cleanup during construction) would be undertaken at developed sites to prevent exposure during future intrusive work (e.g., subsurface utility repairs).

The initial institutional controls would require the project sponsor (and any future owners/developers), prior to seeking or obtaining DOB permits associated with development, to conduct Phase I and Phase II ESAs (to the extent they have not already been conducted), and complete necessary remediation (with appropriate construction-related HASPs) either prior to or as a part of site development, to the satisfaction of the New York City Office of Environmental Remediation (OER).

When development takes place adjacent to or near already developed sites, OER would ensure that appropriate measures would be undertaken to prevent human exposure. These will include measures for dust control, procedures for dewatering, proper management of excavated material and prevention of stormwater pollution from runoff.

Comment 30: At a Community Board 7 meeting, Sterling/Related and the city were challenged to produce scientific reports proving the existence of alleged hazardous contamination at Willets Point. Given that the city claims to own over 90 percent of the Phase 1 properties, the city is certainly able to conduct tests on that land. Not only did they not produce any such report but for several years, the city has rented Phase 1 properties to scores of tenant businesses, which the city could not do if the area was actually hazardous to anyone. Significantly, Dr. James Cervino, a geochemist who is affiliated with the Woods Hole Oceanographic Institution and is also Chair of the CB7 environmental committee, voted to deny this application. If there really was an urgent need to remediate any hazardous contamination at Willets Point, a scientist such as Dr. Cervino would be expected to have approved this application. (WPU-Antonacci)

The City administration spent upwards of \$200 million of taxpayer funds to acquire the Willets Point Phase 1 property, but intends to gift that Phase 1 property to Sterling/Related for the price of \$1. As we understand it, the new rationale for the steeply discounted \$1 price is that the property has “negative

value,” because it is allegedly contaminated. But with no scientific tests performed, how can the taxpayers be certain that a discount of \$200+ million is actually warranted? The City and Sterling/Related are deliberately delaying any scientific testing of Willets Point Phase 1 property until after Sterling/Related have closed the property transaction and taken possession of the property. (WPU-Antonacci)

Response: Business terms are beyond the scope of this project’s EIS. Invasive testing of soil conditions cannot occur while existing leaseholders of the property remain on the site. Results of testing would not be definitive as long as active industrial uses remain. As described in Chapter 10, “Hazardous Materials,” the City has been able to draw certain conclusions based on historical data, and sample testing completed in the roadbeds and on one City-owned property, where access was available.

TRANSPORTATION

Comment 31: The analyses don’t consider impacts, including the impacts of traffic, in Community Boards 3 and 4. (CB3)

The Queens Center Mall as well as the Mall at 63rd Drive and Queens Boulevard, and the Target Mall (also on Queens Boulevard) provide an abundance of retail shopping opportunities for Queens residents in the communities surrounding Flushing Meadows Corona Park. Moreover, all of these shopping areas are easily accessible by public transportation. Any proposed shopping mall in Willets Point West would not be so easily accessible by public transportation, thus resulting in increased traffic congestion in the area. (Russell-Loux)

What is the impact on traffic and quality of life in the surrounding community if the mall is built? (Auburndale)

Response: The comment is incorrect. The DSEIS analysis does include critical intersections located in Community Boards 3 and 4, including Astoria Boulevard at 108th Street, Northern Boulevard at 108th Street and 114th Street, 34th Avenue at 114th Street, and Roosevelt Avenue at 108th Street, 111th Street, and 114th Street. These study locations were vetted by NYCDOT and they are identical to the 2008 FGEIS. The analyses also identified potential impacts, for which feasible mitigation measures have been recommended and approved. These measures were found to be effective in mitigating many of the identified traffic impacts. However, some could potentially remain unmitigated. Of the seven study locations in Community Boards 3 and 4, a maximum of one intersection would be unmitigated in any peak hour in Phases 1A and 1B and a maximum of two intersections would be unmitigated in any peak hour in Phase 2, due largely to the more robust mitigation measures set forth in the DSEIS,

whereas three of the seven intersections were unmitigated in the approved 2008 FGEIS.

As described in the DSEIS, traffic congestion in the study area would be present even without the proposed project, as the expected magnitude of background development in the No Action condition would generate substantial traffic volumes in the study area mostly along the primary streets in the study area network (including Northern Boulevard, Roosevelt Avenue, Astoria Boulevard, and College Point Boulevard). While the study area will be heavily trafficked, and the proposed project would generate traffic resulting in significant adverse traffic impacts, traffic conditions are but one of several factors affecting the character of the neighborhood and residents' quality of life. Moreover, significant adverse traffic impacts could be fully or partially mitigated at most of the impacted locations with signal timing adjustments and other measures, as described in Chapter 21, "Mitigation," and are not expected to contribute to a potential significant adverse impact on neighborhood character. Furthermore, the proposed project would transform the area surrounding CitiField into a thriving new neighborhood and regional destination. The commercial components of the proposed project would complement the adjacent sports venue and strengthen economic activity in the neighborhood. The new structures and open spaces are intended to create an active streetscape enhancing the pedestrian experience. The proposed entertainment and retail destination of Willets West would complement the anticipated development within the District, and both would connect Flushing to the east with Corona to the west through the creation of an unbroken series of uses along Roosevelt Avenue stretching from east of the Flushing River to west of the Grand Central Parkway.

Comment 32: The traffic increase will be beyond the capacities of both highways and side streets. (JHBG)

The only vehicular arteries that can service the area are the Grand Central Parkway, Van Wyck Expressway, Northern Boulevard, and Roosevelt Avenue, arteries that are choked to capacity and cannot in any way be enlarged to handle the huge increase in traffic. (Haber)

We've seen on the studies that there are intersections where you have to wait 15 minutes before you can get through the light. Traffic is going to be backed up for miles and miles and miles. In our opinion, the remaining unmitigated impacts are collectively so severe as to make this proposed development inappropriate and unworthy of approval. (WPU-Antonacci)

Response: As described in Chapter 21, "Mitigation," the DSEIS identifies which highway ramps and mainline segments, and which local street intersections, have sufficient capacity or can be improved via standard traffic capacity improvements or more cost-intensive mitigation measures so that they will

operate acceptably or the magnitude of projected impacts can be minimized. Many roadways and intersections will continue to operate acceptably while others will remain significantly impacted.

Comment 33: Even with the hypothetical mitigation measures in place, there will be very severe traffic impacts, including gridlock conditions at local intersections. From the developer's own mitigation report (Chapter 21 of the DSEIS): delays of 821 seconds, 273 seconds, and 226 seconds—even with the most optimistic mitigation measures in place. Meanwhile, the DSEIS does not even guarantee the feasibility or effectiveness of the recommended mitigation measures but proceeds to rely on them. Back in 2008, the City Planning Commission's report noted that the City would monitor traffic impacts of this development. But when people are experiencing these lengths of delays, what difference would it make to monitor those delays? (WPU-Antonacci)

Response: Several locations, such as 126th Street at 34th Avenue and 126th Street at Roosevelt Avenue, would experience the magnitude of delays noted by the commenter. However, these locations remained unmitigated in the approved 2008 FGEIS, whereas they have been partially mitigated in this DSEIS. In addition, many of the reported significant impacts throughout the study area could be mitigated by the proposed measures. It should also be noted that the number of unmitigated impacts is lower in the DSEIS than the number of unmitigated impacts reported in the 2008 FGEIS due to the recommendation of additional standard and cost intensive measures. The maximum number of unmitigated intersections during any peak hour in the approved 2008 FGEIS was 14 intersections, whereas the maximum number of unmitigated intersections during any peak hour for this Final SEIS would be seven in Phase 1A, four in Phase 1B, and eight in Phase 2. All proposed mitigation measures have been reviewed and approved by NYCDOT. The DSEIS also commits the developer to conducting a comprehensive traffic monitoring plan at each phase that is aimed at potentially identifying additional mitigation measures where possible and where warranted. Furthermore, the developer has committed to establish a \$1.9 million Traffic Mitigation Fund for the cost of studies and improvements which address infrastructure or traffic issues relating to the project.

Comment 34: The traffic studies that were conducted didn't include mitigation for 114th Street, Astoria Boulevard, 34th Avenue, Roosevelt Avenue, and Northern Boulevard, just to name a few. It did not consider the impact of public transportation, solely our No. 7 train, which is already overtaxed. (CB3)

Response: Key intersections along the above referenced corridors were analyzed as part of the DSEIS, including Astoria Boulevard at 108th Street, Northern Boulevard at 108th and 114th Streets, 34th Avenue at 114th Street, and Roosevelt Avenue at

108th, 111th, and 114th Streets. The DSEIS identifies mitigation measures at these locations during any peak hour in which the intersections are significantly impacted and, where feasible and practical mitigation for impacts is not available, the DSEIS discloses those locations as being unmitigated. The DSEIS also analyzes the area's subway and bus services. Similar to traffic, where significant impacts are identified, mitigation measures were recommended and, where no feasible mitigation measures can be identified, the corresponding impacts are disclosed as unmitigated.

Comment 35: EDC claims that by adding the Willets “West” Mall they will actually reduce traffic congestion—this is a preposterous claim; the Willets “West” Mall will make traffic congestion far more severe than what was reported in the WP FGEIS. (WPU-Ketcham)

Response: The analyses in the DSEIS show that the number of fully mitigated impacts for full buildout of the proposed project would be higher than the number of fully mitigated impacts reported in the prior 2008 FGEIS, which did not contain the Willets West development. In addition, the number of unmitigated impacts is lower in the DSEIS than the number reported in the 2008 FGEIS. Even though Willets West is expected to increase the volume of traffic generated under full buildout conditions, a series of cost-intensive mitigation measures have been identified within the DSEIS, which were not identified in the 2008 FGEIS, and the developer has committed to funding those measures. It is these measures, which go above and beyond those proposed in 2008, that have resulted in a reduction in unmitigated impacts of the proposed project.

Comment 36: The plan is too big for the area; Willets Point is surrounded by what are already the nation's most congested expressways; the Willets “West” Mall/Willets Point Project will only make conditions worse. Project impacts reported in the DSEIS are extremely severe and it is unlikely many can be mitigated. (WPU-Ketcham)

Response: As described in Chapter 21, “Mitigation,” the DSEIS clearly identifies projected significant traffic impacts on both the highway network and local street intersections. Some, but not all, of these roadway network locations are congested today, some would be significantly impacted, while others would be mitigated using a combination of standard traffic capacity improvements and new, cost-intensive measures that were identified during the course of completing the DSEIS. All proposed mitigation measures within its jurisdiction have been reviewed and approved by NYCDOT.

Comment 37: Mitigation for expressways is not described in the DSEIS; major changes to expressways take years and require their own individual engineering and environmental assessments delaying project implementation. Much of the mitigation proposed in the DSEIS requires the preparation of a site-specific EA

along with traffic analysis and engineering drawings all subject to NYSDOT and FHWA approval. Each action requires new counts specific to each location. The DSEIS warns of this problem on page 21-29: mitigation “... measures that may call for detailed review by both NYCDOT and NYSDOT ... if these mitigation measures are modified or rejected by the review agencies, significant adverse impacts identified above would be unmitigated.” What guarantees can the developer provide that the Willets Point project will not experience the same delays and what impact would that have on project completion schedules? And, who is going to pay for mitigation? Including intersection expansion plus modifications to expressways and ramps (plus \$70 million for just the Van Wyck ramps) we are looking at hundreds of millions of dollars in reconstruction. (WPU-Ketcham)

Response: Mitigation measures that would improve conditions on the expressway segments analyzed in the DSEIS have been identified in the DSEIS, and the effects of those mitigation measures on ramp and mainline conditions have been fully documented. They do include physical widenings at the ramp’s at-grade connection to the local streets, signalization of ramp intersections with local streets, and the reconfiguration of the ramp intersections to promote smoother and more efficient flow both at the intersection and upstream on the roadway approaches to those intersections. The developer has committed to funding the implementation of the traffic mitigation measures outlined in the DSEIS. Furthermore, the City sought and received approval for the Van Wyck Expressway ramps and has continually expressed its commitment to fund and construct them.

Comment 38: Proposed mitigation still leaves intersections and expressways gridlocked; this is especially true for Astoria Blvd., Northern Blvd. and Roosevelt Avenue. (WPU-Ketcham)

Response: Several locations along these corridors and expressways would be significantly impacted, as is documented in Chapter 21, “Mitigation,” of the DSEIS. However, the combination of standard mitigation measures and cost-intensive mitigation measures have been identified which would partially or fully mitigate many of the impacts that were disclosed, both on the local roadway network and the surrounding expressways. The maximum number of unmitigated intersections during any peak hour in the approved 2008 FGEIS was 14 intersections, whereas the maximum number of unmitigated intersections during any peak hour for this FSEIS would be seven in Phase 1A, four in Phase 1B, and eight in Phase 2. In addition, the proposed mitigation measures would improve conditions along segments of roadway and at intersections that are currently congested.

Comment 39: It appears that the DSEIS uses trip generation factors that are considerably lower than real world experience with comparable uses would show are appropriate. (WPU-Gerrard)

The DSEIS low balls the number of trips this project will generate; a great deal more traffic will in fact be produced than reported further gridlocking the area. (WPU-Ketcham)

Response: The trip generation factors used in the DSEIS are largely based on those used in the 2008 FGEIS, which have been used on numerous New York City development projects and approved by NYCDOT as fully appropriate for New York City conditions. Where appropriate, these factors were updated in compliance with the 2012 *CEQR Technical Manual*, and any updates were reviewed and approved by NYCDOT. They do not underestimate potential trip-making associated with the three phases of the proposed project.

Comment 40: For example, the DSEIS reports that less than 60 percent of shoppers will use autos to access the site; today 85 percent of Queens's shopping trips are by auto; 95 percent of shoppers to large malls arrive by auto; for destination retail the DSEIS under reports auto trips by 50 percent. The developer assumes that 59 percent of shopping trips will be made by auto with the rest by walking or transit. This number appears incredibly low when compared to other isolated shopping malls like Gateway Plaza in Brooklyn or Palisades Mall in West Nyack, both of which exceed 95 percent of shoppers arriving by auto; and both of which provide double the parking per 1,000 sf of retail space. The developer must provide its source justifying this 59 percent assumption. The effects of using reported auto use for isolated destination malls compared to 59 percent are striking. (WPU-Ketcham)

Response: As stated above in the previous response, all trip generation assumptions used in the DSEIS were fully vetted and approved by NYCDOT. With regard to the proportion of trips traveling to and from the destination retail by auto, the mode share used in the FGEIS was actually conservative toward auto use. As summarized in Tables 14-29 and 14-30 of the DSEIS, the destination retail modal split profile is based on what was used in the 2008 FGEIS. In that document, it was explained that this trip-making profile was developed for the Gateway Center at Bronx Terminal Market in the Bronx, which was determined (with NYCDOT concurrence) to be the appropriate model to follow for Willets Point. Both sites have comparable subway access and nearby residential uses, and are adjacent to baseball stadiums.

Contrary to the commenter's assertion, the planned destination retail uses in Willets West and the Special Willets Point District would not be "isolated destination malls." The Willets Point development would be a high-density development located near existing high-density residential areas. Moreover, the District is accessible by a nearby Long Island Rail Road (LIRR) station and the

Mets-Willets Point subway station, as well as by local bus routes which, as stated in the DSEIS, are expected to improve over time. Gateway Center in the East New York section of Brooklyn, on the other hand, is not located near any subway or commuter rail lines. The commenter also cited the Palisades Mall in West Nyack for comparison. Palisades Mall is situated at a location where there is no rail service and very limited bus service, with sparse adjacency to low density residential and other uses. Therefore, neither Gateway Center in East New York nor Palisades Mall in West Nyack can be considered a more comparable model than Gateway Center at Bronx Terminal Market for the future Willets Point destination retail uses.

Comment 41: Destination retail would be responsible for more than half of total trips reported for this project; there is no justification for nearly 2 million square feet of new destination retail in the Willets Point area. (WPU-Ketcham)

Response: The amount of destination retail space contemplated under the DSEIS is greater than what was studied and approved in the 2008 FGEIS and subsequent Technical Memoranda. However, with approximately one million square feet of destination retail now allocated to Willets West, the current plan calls for less destination retail within the Special Willets Point District, which allows for more local-oriented retail uses within the District. Tables 14-53 and 14-54 in the DSEIS summarize the projected person and vehicle trip generation estimates for various components of the proposed project during seven analysis peak hours. The percent of projected destination retail trip generation as of the total peak hour trip generation was estimated to range from 22.8 to 46.1 percent for person trips and from 29.5 to 55.6 percent for vehicle trips. Hence, only some of the analysis peak hours would incur vehicle trip-making that comprises marginally greater than 50 percent from the destination retail use. With regard to justification for the amount of destination retail, the socioeconomic conditions analysis in the DSEIS assesses the existing and projected capture rates for retail spending in the primary trade area and concludes that there is sufficient demand for the destination retail uses contemplated in the proposed project.

Comment 42: The project proposes relatively little parking for the size of the project; proposed parking cannot accommodate parking demand; spillover traffic will intensify gridlock conditions. The developer appears to justify providing little parking on the basis of extremely optimistic trip generation rates and the heavy use of public transit that really does not exist. Experience elsewhere at large malls suggests not only that they attract many more auto trips per 1,000 square feet of retail space, but they typically provide double the number of parking spaces per 1,000 square feet of retail space than is being provided at either the Willets “West” Mall or for the destination retail proposed for Phase 2 of the project. (WPU-Ketcham)

Response: As detailed above in response to Comment 39, the DSEIS's trip generation estimates are based on data and assumptions that are more appropriate than those suggested by the commenter and that have been fully vetted and approved by NYCDOT. These trip generation estimates were used as inputs to the projection of parking needs, as summarized in Tables 14-60 to 14-62 of the DSEIS for the 2032 Phase 2 full build-out. Notwithstanding the commenter's assertion that "experience elsewhere at large malls" would typically provide more parking per 1,000 square feet of retail space than what is planned for this project, the DSEIS's parking analysis concluded that the amount of parking planned for uses in Willets West and the Willets Point District would adequately accommodate the projected parking demand.

Comment 43: The project relies on substantial public transit service; there is no way the MTA can meet proposed transit demand; the No. 7 line will be gridlocked if this project is built; commuters will face huge delays. (WPU-Ketcham)

The No. 7 train will need to be a double decker to handle demand. (JHBG)

The DSEIS says that in 2032 with the project built, on the Manhattan-bound express No. 7 train, the volume/capacity ratio would be 1.20, and the available capacity would be -3,673 (minus 3,673). In other words, the subway would be able to carry 3,673 fewer people per hour than want to take it, even with the subways running at the maximum capacity that the signal system will allow (Table 14-143, p. 14-190). In order to alleviate some of the subway crowding, the DSEIS suggests providing more LIRR service there (p. 14-156). Again, there is no discussion of whether this is feasible, what it would entail, or how much it would cost, and there is no commitment to do it. (WPU-Gerrard)

Response: The DSEIS's transit analysis acknowledged that the Manhattan-bound No. 7 express subway line is currently (2012) operating at over its guideline capacity during the AM peak hour and is projected to continue operating over capacity in the future with or without the proposed project even with the scheduled addition of one subway train during this peak hour. However, it should be noted that the capacity used for assessing subway service is its guideline capacity. For the Division A subway cars that operate on the No. 7 line, the guideline capacity is 110 passengers per subway car (including about 40 seated and 70 standing). During peak hours, it is not uncommon for subway cars to carry passenger loads above this guideline capacity. In fact, the physical capacity of Division A subway cars is between 160 and 170 passengers, or approximately 50 percent higher than its guideline capacity. Therefore, contrary to the commenter's assertion, having a volume/capacity ratio of 1.20 does not mean that the subway line would be unable to carry people who want to take it. It indicates that the crowding level of the line would increase to above guideline capacity during this peak hour.

The City has consulted with the Metropolitan Transportation Authority (MTA) on expanding regular LIRR service along its Port Washington Branch to the existing Willets Point LIRR station when the actual demand shows that such service improvement is warranted. The Port Washington Branch currently runs regular service between Port Washington and Penn Station. Currently, it serves the Willets Point LIRR station only during Mets game days, the US Open, and other special events. Since both the station and the line already exist, there would be little or no capital costs associated with implementing regular service at the Willets Point LIRR station. The additional operating costs incurred should also be marginal and recovered through the additional fare collection from future new riders. As part of MTA's regular operational assessments, the agency would review future demand and effects on scheduling due to the inclusion of a potential additional scheduled stop at the Willets Point LIRR station.

Comment 44: The addition of 61 million miles of vehicular travel produces considerable externality costs, not just traffic accidents costs but the health costs of added air pollution, traffic noise, water pollution and so forth. These costs are not trivial: for full Willets Point build out including the Willets "West" Mall these costs total \$120 million every year—costs that are far greater than any benefits provided to NYC by the Willets Point project. (WPU-Ketcham)

Response: The commenter does not provide any estimated benefits that the proposed project would provide New York City but claims that it would be far less than his projection of the project's externality costs, which were developed based on traffic estimates independently by the commenter without review by NYCDOT. The project will result in the environmental remediation of 62 acres of contaminated land, and Phases 1A and 1B, alone, will result in \$3 billion of private investment in Queens, the development of nearly 900 units of affordable housing, and the creation of an estimated 12,000 construction jobs and 7,000 permanent jobs. As described in Chapter 17, "Noise," noise associated with traffic generated by the proposed project and its associated parking facilities would not be expected to result in any significant increases in noise levels, including at World's Fair Marina Park, which was predicted to experience a significant adverse noise impact in the 2008 FGEIS. To meet the CEQR interior noise level requirements, the DSEIS prescribes between 31 and 43 dBA of building attenuation for the proposed project buildings, which is similar to the amount of building attenuation specified in the 2008 FGEIS. Similar to what was predicted in the 2008 FGEIS, noise levels in the newly created open spaces would be greater than the 55 dBA $L_{10(1)}$ criteria set forth in the *CEQR Technical Manual*, but would be comparable to other parks around New York City and would not constitute a significant adverse impact. As described in Chapter 15, "Air Quality," the proposed project would not result in any violations of National Ambient Air Quality Standards or exceedances of the *de minimis* criteria set forth in the *CEQR Technical Manual*. Furthermore, there would be

no potential for significant adverse air quality impacts from the proposed project's heating and hot water systems (considering buildings proposed for construction in all phases), provided that certain restrictions on the fuel type, placement of heating and hot water system stacks, and use of low-nitrogen oxide (low-NO_x) burners are imposed. As described in Chapter 19, "Neighborhood Character," the proposed project would result in an improvement in neighborhood character, as it would remediate the area and would represent a significant investment to improve the project area's infrastructure.

Comment 45: Assuming the assumptions reported in the DSEIS are correct (and we do not believe they are) total project build out will generate 194 million added vehicle miles of travel. The effects of Willets Point on traffic accidents have been ignored. The FGEIS for the Willets Point Development Plan reports that the project will add 80,000 car and truck trips a day, 365 days a year, generating 116 million additional miles of travel annually. Based on NYSDOT traffic accident rates for NYC the WP project will thereby increase auto and truck accidents by 944 a year including 2 dead and 316 injured. Including the cost of property damage the cost to motorists and society total \$41 million in 2017. Adding another 28,000 car and truck trips a day or 61 million miles of travel each year for the Willets "West" Mall will increase this number to 1,578 crashes annually with 3 dead and 528 injured and approximately 2,500 more cars and trucks damaged. The total cost of the combined effect of Willets "West" Mall and the Willets Point Development Plan in 2032 would be \$124 million annually. Externality costs for total build out including accident costs (\$40 million each year in increased health care and property damage) in 2032 would total \$382 million annually. (WPU-Ketcham)

Response: The FGEIS did not report a daily trip-making of 80,000 car and truck trips. Both this and the 28,000-trip figures, as well as the annual vehicle-mile and accident projections, were estimated by the commenter.

There are many factors that contribute to accidents, not solely traffic levels, including signage, roadway geometry, sight lines, intersection control, pavement conditions, crosswalk markings, curbside usage, and driver/pedestrian behavior. The traffic safety assessment in the DSEIS was prepared in accordance with *CEQR Technical Manual* guidelines. This assessment, which was vetted and approved by NYCDOT, examined the causes of high accident locations in the study area and provided recommendations on how safety improvements can be made in the vicinity of the District.

The CEQR methodology for traffic safety assessment leads practitioners toward prevention rather than attempting to predict what may occur in the future. It stipulates a low threshold (5 bicycle or pedestrian related accidents per year) for identifying high accident locations regardless of how much traffic traverses those locations. For the high accident locations, the analysis in the DSEIS

evaluated accident trends, identified safety improvement measures, and addressed the effects the proposed project could have on the safety of these locations. This approach is consistent with the City's continuing effort to improve traffic and pedestrian safety across the five boroughs.

Comment 46: The developer reports that he will add an additional 1.4 million square feet of shopping mall/entertainment facilities to the already oversized Willets Point development. According to the FGEIS, the 11 million square feet Willets Point project will add 80,000 car and truck trips to the project area with significant impacts at 78 percent of all intersections analyzed and adding Willets West Mall will increase project traffic by about 25 percent and further impact nearby intersections, expressways and expressway entry/exit ramps. Level of Service (LOS) F is reported at many mitigated intersections—for full intersections (many that cannot be mitigated at all) and/or at many intersections they claim to mitigate that retains one or more intersection approaches that remain at LOS F or worse. (WPU-Ketcham)

Response: The 1.4 million square feet of entertainment and retail facilities that the commenter alludes to as in addition to the Willets Point development project is not accurate. First, Willets West is anticipated to contain only one million leasable square feet of entertainment and retail space (400,000 square feet would be non-leaseable common area and back-of-house space). Second, in the 2008 FGEIS, the proposed project included 1.7 million square feet of retail space in the Special Willets Point District whereas in the DSEIS the District is projected to include only 1.25 million square feet of retail space (450,000 sf less than noted by the commenter) by the end of Phase 2 in addition to the one million square feet of leasable entertainment/retail space in Willets West, which would result in a net increase in retail-type development of 550,000 leasable square feet, not 1.4 million square feet.

Regarding the comment that the 2008 FGEIS would add 80,000 car and truck trips to the area, it should be pointed out that this is the commenter's estimate and not a number contained in the FGEIS. Assuming that the commenter has developed it as an estimate of daily trips, it must be pointed out that traffic analysis methodologies all utilize peak hour trips, not daily trips, to evaluate the capacity of the roadway network to accommodate future traffic as per the *CEQR Technical Manual*. Although the addition of West Willets would add traffic to the roadway network, additional cost-intensive mitigation measures have been identified beyond the measures identified in the FGEIS that would allow for increased mitigatability of projected traffic impacts. The number of partially or fully mitigated locations is higher than the number reported in the FGEIS. The DSEIS does identify locations that would continue to operate at LOS F as part of its full disclosure of projected future conditions; this is not unusual for many locations within New York City. The DSEIS commits the developer to a comprehensive traffic monitoring plan that will evaluate future conditions and

potentially be able to identify additional measures to help mitigate adverse conditions further.

Comment 47: The DSEIS reports operating conditions at approximately 30 key intersections affected by the Willets Point project. While relatively few intersections are examined in the DSEIS, project impacts are clear: adding 8,000 to 10,000 hourly car and truck trips to peak travel hours will impose severe restrictions on travel. This can be seen by examining Table 14-59 which shows project impacts for virtually every intersection examined in the DSEIS. (WPU-Ketcham)

Response: The DSEIS analyzes the same approximately 30 key intersections as those analyzed in the 2008 FGEIS and the number and location of these analysis locations was vetted by NYCDOT as part of the scoping process for the DSEIS. During the time between certification of the DSEIS and FSEIS, two additional intersections along 126th Street and one additional intersection along Northern Boulevard adjacent to the District were included in the analyses for this SEIS. Table 14-59 identifies the number of intersections that would be significantly impacted under With Action conditions without proposed mitigation measures implemented. However, a majority of those impacted intersections can be either fully or partially mitigated, as discussed in Chapter 21, "Mitigation."

Comment 48: A review of all results for peak hours with available mitigation shows that during evening peak hours, access roads to Willets Point (Northern Boulevard, Roosevelt Avenue, Astoria Boulevard) will be gridlocked. With all the mitigation the developer proposed he leaves critical intersections with overall average vehicle delays of 100 to 200 seconds and these conditions do not get better on Saturday. While Table 22 shows some locations along these access roads can be fully or partially mitigated, the community is still faced with gridlock traffic conditions with cars facing two or three signal cycles to move through an intersection. For 126th Street at Roosevelt Avenue and 34th Avenue, we find a number of intersection approach movements at LOS F, with delays of between 100 to more than 800 seconds. Project traffic creating huge delays will create a huge impediment to the operation of Willets Point and will be of even greater consequence on a Mets game day. (WPU-Ketcham)

Response: As the commenter noted, several locations along access roads to Willets Point would experience congestion and cars would face more than one cycle at several locations. However, it should also be noted that the number of unmitigated impacts is lower in the DSEIS than the number of unmitigated impacts reported in the 2008 FGEIS due to the additional standard and cost intensive measures that have been proposed. Traffic conditions were analyzed for Mets game days and mitigation measures were proposed for those conditions as well. In addition, New York City Police Department (NYPD) would continue to operate several intersections surrounding Citi Field that they operate in existing conditions

during game times. The DSEIS also commits the developer to conducting a comprehensive traffic monitoring plan at each phase that is aimed at potentially identifying additional mitigation measures where possible and where warranted.

Comment 49: The complexity of Roosevelt Avenue at 126th Street—a main entry point into the Willets Point project—is not discussed in any detail. How do the columns supporting the overhead No. 7 transit line impede the efficient movement of traffic or reduce sight distance and thus after safety. The City Planning Commission needs intersection and expressway drawings to make this review more effective. (WPU-Ketcham)

Response: The existing analyses and calibration of the model were based upon the prevailing roadway conditions. These take into consideration all the limitations, such as limited cone of vision, narrow lane widths, etc. The future build analyses reflect the same limitations as under existing conditions. Schematics that show the proposed mitigation measures have been reviewed and approved by NYCDOT.

Comment 50: Due to breakdown conditions in all directions, the project will create huge traffic delays along access roads spilling back onto the surrounding expressway system. In addition, the project will have a huge negative effect on the community, imposing greater traffic delays, more traffic injuries and deaths, and other costly externalities to the million motorists that pass by Willets Point each day on nearby expressways and arterials. (WPU-Ketcham)

Response: The DSEIS acknowledges that several key access roads would be impacted under With Action conditions, as determined both by intersection level of service analyses and by a roadway network corridor simulation, or CORSIM, analysis that depicts conditions on highway mainline segments and on highway ramps at their intersections with local intersections. However, standard mitigation measures and more cost-intensive mitigation measures have been identified and would mitigate most significant impacts either partially or entirely. See response to Comment 44 above with regard to externalities.

Comment 51: A comparison of the rates used in the DSEIS with those reported in the 1991, 2001 and 2012 *CEQR Technical Manuals* shows little change in trip generation rates over this period. We know that many of the assumed trip generation rates date to the Regional Plan Association that did counts in the early 1960s in Manhattan. How can the developer justify using these antiquated rates especially outside Manhattan? The *CEQR Technical Manual* advises that if rates are over 3 years old the developer should take counts at representative locations. WPU has repeatedly requested that the developer undertake such counts. For a project of this size with the severe traffic impacts that the developer has reported in the DSEIS how can they continue to rely on ancient data? The numbers

recommended in the *Technical Manual* date from two to three decades back in time when demographics and travel behavior were very different from today. These are the same numbers used in the FGEIS and now in the DSEIS to under report traffic impacts. For example, increasing shopper trips to destination retail from 59 percent to 90 percent would increase vehicle miles of travel by 36 percent to 83 million miles of vehicular travel annually, from 61 million estimated using DSEIS assumptions. For full project build out, Phase 2, if we stick with 90 percent of shoppers accessing Willets West destination retail by auto (it is an isolated site with poor transit access), assume that for destination retail east of 126th Street 80 percent of shoppers will arrive by auto, and assume that the additional local retail proposed for Phase 2 is assumed to be destination retail, the result is an overall increase in average weekday vehicular travel to 109,386, an increase of 21,864 trips, and an increase of 25 percent. This is a conservative adjustment. We have not tinkered with other trip generation assumptions, most of which do not have supporting documentation. (WPU-Ketcham)

Response: As stated in the previous responses (to Comments 39 and 40), the trip generation factors used in the DSEIS, some of which are recently developed and others of which are based on past research, were reviewed and approved by NYCDOT in compliance with the 2012 *CEQR Technical Manual* as an accurate conservative representation of trip-making characteristics. The commenter is incorrect in citing that “the *CEQR Technical Manual* advises that if rates are over 3 years old the developer should take counts at representative locations.” Rather, it states that if “the source cited be considered “stale” by the lead agency, in consultation with NYCDOT, it is recommended that an original survey be conducted for the same land use in a comparable setting of the City.” NYCDOT thoroughly reviewed all trip generation factors and approved them for use on this project. Also, in addition to providing an incorrect modal split assumption for destination retail uses (see response to Comment 40), the comment that local retail within the Willets Point District should really be destination retail is without basis.

Comment 52: The DSEIS reports average weekday and average Saturday traffic impacts. Weekly and seasonal variations are not disclosed. The Institute of Transportation Engineers (ITE) *Trip Generation Manual* reports that traffic is 19 percent greater on Friday than weekdays and 51 percent greater on Friday than Saturdays for shopping malls. It also reports that Decembers produce 42 percent more traffic during the month than for annual averages. As a result of holiday effects, the parking supply is good for only half of demand. If these differences were accounted for, you would find true “worst-case” conditions that would be significantly worse than reported. (WPU-Ketcham)

Response: The DSEIS provides detailed analyses for seven peak periods, including three on weekend days. The purpose of an EIS is to conservatively analyze a

“reasonable” worst case condition for potential impacts. Consistent with other approved EISs for retail uses, conditions that may occur during the December shopping season or only on “Black Friday” are not subject to analysis under CEQR.

Comment 53: The DSEIS manipulates temporal assumptions to minimize peak hour parking demand. The developer’s assumption does not agree with ITE numbers for large shopping malls. The developer must provide documentation justifying the assumptions made for hourly parking arrivals and departures for the eight land use types evaluated in the DSEIS. (WPU-Ketcham)

Response: The 2012 *CEQR Technical Manual* states that “the ITE Trip Generation Report contains auto trip generation rates for a wide range of land uses, but most of these rates reflect nationwide averages based on surveys conducted in suburban settings, often with little or no available public transportation. Therefore, these rates may not be appropriate for the urban character of New York City.” As stated above in previous responses (to Comments 39 and 40), the trip generation factors used in the DSEIS were reviewed and approved by NYCDOT in compliance with the 2012 *CEQR Technical Manual*. Similarly, the parking demand projections, which are based on the peak hour trip generation estimates, were also fully vetted and approved by NYCDOT.

Comment 54: The Long Island Expressway and Grand Central Parkway (south of the Long Island Expressway) were not analyzed as part of the DSEIS and both will be heavily impacted by the expanded Willets Point project (another 28,000 daily car and truck trips from what was examined in the FGEIS). NYSDOT engineers report that the Grand Central Parkway south of the Long Island Expressway cannot take “one more new vehicle trip from the WP project” even after they spend \$1 billion realigning that expressway near the Jackie Robinson Parkway. Both should be examined in a verified EA for the Van Wyck Expressway ramps. (WPU-Ketcham)

Response: The extent of the traffic study area was determined through the scoping process that included review and approval by NYCDOT. The Grand Central Parkway and Van Wyck Expressway north of the Long Island Expressway carry more concentrated volumes of project-generated trips compared to the two segments mentioned by the commenter, since the two referenced highways are feeder roadways to the analyzed highway segments. In addition, due to implementation of the proposed cost-intensive measures at the highways’ intersections with the local network, the speeds along the analyzed highway mainlines would improve compared to the With Action conditions. It is also the same highway network approved for analysis in the 2008 FGEIS. See Response to Comment 5 regarding a verified EA for the Van Wyck Expressway ramps.

Comment 55: Expressway data are totally missing from the DSEIS. Internal site specific traffic movements for the WP project are no longer provided as well. How can anyone evaluate the DSEIS when the traffic network has been simplified so greatly by removing critical data that was originally provided in the FGEIS? The developer must provide maps showing vehicular trip assignments by land use type for new no-build construction and for full build out trips including the local project roadway network. The developer must also provide maps showing traffic volumes along all expressways and expressway ramps on which all Willets Point vehicular trips have been assigned with and without WP Phases 1A, 1B, and 2. (WPU-Ketcham)

Response: The DSEIS documents existing and projected speeds, densities, and levels of service for all expressway segments and ramps in its traffic study area. Traffic volume maps were prepared and have been reviewed and approved by NYCDOT. These volume maps appear in Appendix C of the DSEIS. Streets within the District would be demapped and would no longer remain as public streets. Private streets would then be constructed within the District based on general design guidelines, which will ensure that the streets adequately serve circulation needs for future users. In addition, the DSEIS contains a commitment from the developers to conduct a traffic monitoring program that would ascertain actual traffic conditions and respond with appropriate mitigation, if necessary. Such a plan can also be used to monitor internal conditions once the design is finalized and the development is built and occupied. Accordingly, the DSEIS provides a detailed assessment of the key corridors and intersections leading to and from the District and bordering the District, and which are most prone to impacts requiring mitigation analysis.

Comment 56: Chapter 21 on mitigation provides considerable insight on project impacts and how hard it is to mitigate so large a project as Willets Point. Table 21-23 shows the significant impacts for an average weekday in Phase 2 and shows that while some improvements are made, it also shows the traffic mess that is left. The impacts are severe and the DSEIS provides little confidence that much real mitigation can be accomplished. (WPU-Ketcham)

No one is committing to the “effectiveness” and “feasibility” of the specific mitigation measures. Rather, a future, final version of the mitigation report may conclude that all or some of the recommended mitigation measures are simply not effective, or even feasible, in which case the improvements in traffic flow shown in the present mitigation report will not occur, and those impacts may instead be unmitigated. Achieving the vastly improved traffic flows described in the mitigation report requires measures that NYCDOT and NYSDOT have not yet reviewed or approved, and which they may eventually reject. How can anyone rely on a report that cannot vouch for even the “feasibility” of the alleged solutions that it presents? (WPU-Antonacci)

Response: Through a combination of standard traffic capacity improvements and more cost-intensive mitigation measures that would be funded by the developer, the number of fully mitigated impacts under Phase 2 full buildout conditions would be higher than the number of fully mitigated impacts reported in the prior 2008 FGEIS; and, the number of unmitigated impacts is lower in the DSEIS than the number reported in the 2008 FGEIS. The feasibility of the proposed mitigation measures has been reviewed by NYCDOT. The DSEIS also commits the developer to conducting a comprehensive traffic monitoring plan that is aimed at potentially identifying additional mitigation measures where possible and where warranted.

Comment 57: The DSEIS does not provide detailed descriptions of what mitigation the developer is proposing for various expressways or expressway ramps. The DSEIS has no drawings illustrating each mitigation location. Written descriptions are too brief and just not good enough for public review. (WPU-Ketcham)

Response: Mitigation measures have been identified for highway ramps and at their intersections with the local roadway network, which would also result in improved conditions on several expressway segments. The mitigation measures are described in the DSEIS in sufficient detail to convey the key elements of the proposed improvements, both in the text of Chapter 21, “Mitigation,” as well as the mitigation tables in the back of that chapter. Schematics for these proposed mitigation measures have been prepared for illustrative purposes only and have been provided to NYCDOT to assist in their review.

Comment 58: In the year 2032, under the “No Action” condition, the average speeds on the westbound Grand Central Parkway between Roosevelt Avenue and the Long Island Expressway on non-game days would be 48.1 mph during the weekday AM run, 43.0 mph during the weekday midday, and 37.7 mph during the evening rush. If the project is built, the average speeds during those same periods on non-game days would be 6.7 mph, 0.0 mph, and 0.4 mph, respectively. The FSEIS should calculate the travel time from one end of the studied segment to the other. The meaning of a 0.0 mph speed on a highway should also be explained. The FSEIS should also explain the impacts of these speeds on emergency response times and on airport access. (WPU-Gerrard)

Response: The traffic analyses that were conducted conform to *CEQR Technical Manual* guidelines, which do not call for the use of point-to-point travel time projections. The speeds during the non-game weekday AM, midday, and PM peak hours of 6.7 mph, 0.0 mph, and 0.4 mph, respectively, are representative of speeds on that segment under the 2032 With Action condition *without mitigation* measures in place. With proposed mitigation measures in place, speeds would increase significantly during the non-game weekday AM, midday,

and PM peak hours to 48.1 mph, 24.1 mph, and 36.9 mph, respectively. As discussed in Chapter 4, “Community Facilities,” the proposed project would generate additional traffic on roads throughout the area, including the possible routes used by FDNY and EMS vehicles to access the project site. Traffic at certain intersections near the project site may result in slower access for FDNY and EMS vehicles. However, FDNY and EMS vehicles, when responding to emergencies, are not bound by standard traffic controls or rules and are capable of adjusting to congestion encountered en route to their destinations and are therefore less affected than other vehicles by such congestion. FDNY vehicles are also equipped with enhanced sirens and emergency lights that assist them in safely navigating through congested areas. These vehicles would be able to access the project site as they do other areas throughout New York City, including the most congested areas of Downtown Flushing. Furthermore, EMS units are assigned a permanent cross-street location where they await a service call. If warranted by demand, the FDNY could assign an EMS unit within the District to provide services to the new population.

Comment 59: If the mitigation measures are undertaken, the DSEIS projects speeds in 2032 under the “build” condition of up to 48.8 mph during the morning rush and 48.1 mph during the evening rush, but they would still be at 6.7 mph during the midday. (DSEIS Table 21-21, p. 21-50.) (WPU-Gerrard)

Response: The commenter misinterpreted the data on page 21-50. The three columns do not represent the AM, midday, and PM peak hours, but rather represent “No Action,” “With Action,” and “With Mitigation” for the weekday AM peak hour. The 6.7 mph that the commenter refers to is the speed of the westbound Grand Central Parkway (east side) between Roosevelt Avenue and the Long Island Expressway during the non-game weekday AM peak hour. The impact at that location would be mitigated and the projected resulting speed would improve to 48.1 mph, which is very close to the speed under No Action conditions.

Comment 60: If the City approves the project, the SEQRA Findings Statement will have to explain why it is acceptable to undertake a lengthy and expensive action that will result in traffic speeds of 6.7 mph, 0.0 mph, and 0.4 mph on one of the City’s major arteries. If reliance is placed on the lane-widening and other mitigation measures, then (1) those measures should be explained in detail; (2) their collateral consequences (e.g., condemnation of real property and consequent loss of housing and jobs) should be enumerated; and (3) they should be committed to. (WPU-Gerrard)

Response: The speeds that the commenter refers to are speeds under the With Action conditions, without mitigation measures implemented (as also noted in the Response to Comment 58 above). Speeds would increase considerably after implementation of cost-intensive mitigation measures, as explained in the

Response above, some of which would reach near No Action speeds. As discussed in the Response to Comment 57, schematics for these proposed mitigation measures have been provided to and reviewed by NYCDOT. All the mitigation measures are described in detail, both in the text of Chapter 21, “Mitigation,” as well as the mitigation tables in the back of that chapter. Furthermore, the developer has committed to funding the implementation of the enumerated mitigation measures.

Comment 61: In 2032 on non-game days under No Action conditions, the number of signalized intersections with LOS F would be 1 during the weekday morning peak, 4 during the weekday midday peak, 2 during the weekday evening peak, and 3 on Saturday midday. Under With Action conditions, those numbers become 9, 12, 15, and 13. Numerous intersections cannot be mitigated at all. (WPU-Gerrard)

Response: The numbers cited by the commenter refer to the With Action conditions *without* mitigation implemented. Under the 2032 Phase 2 conditions with mitigation implemented, the number of intersections that operate at LOS F would be 2 in the non-game weekday AM peak hour, 7 in the non-game midday peak hour, 10 in the non-game PM peak hour, and 9 in the Saturday non-game midday peak hour. In addition, the number of intersections that are entirely unmitigated is lower in this DSEIS than the number of unmitigated impacts in the 2008 FGEIS.

Comment 62: My comments of September 27 on the draft scope for this DSEIS stated, “The City has a history of releasing wildly contradictory reports about the traffic impacts of this project, without ever clearly explaining the reasons for these discrepancies. The supplemental EIS should include a table comparing the assumptions, methodologies and other inputs of the traffic study used there and all the prior traffic studies for this project, so that readers can understand the differences and draw their own conclusions as to which, if any, is valid.” The DSEIS failed to include this table. The FSEIS should include it. (WPU-Gerrard)

Response: The assumptions, methodologies, and other inputs follow the latest *CEQR Technical Manual* procedures and were subject to review and approval by the lead agency and NYCDOT. Such assumptions have been identified in this DSEIS. The methodologies used in the analyses for the DSEIS are comparable to those used in the analyses for the 2008 FGEIS. However, new traffic data were collected and incorporated into the model based on prevailing existing conditions.

Comment 63: The tables in the DSEIS (though not the text, except euphemistically) reveal that conditions within the Mets-Willets Point No. 7 subway station would also become horrible; especially the stairs from the Roosevelt Avenue entrances

down to the mezzanine. Conditions in 2032 on non-game days without the project show an LOS A for these stairs (Table 14-111, p. 14-156); in 2032 with the project, the LOS is E+ for one staircase and D+ for two. (Table 14-141, p. 14-187.) The DSEIS says that wider staircases could help alleviate this condition, but that it is not clear whether this would be feasible, there is no indication of how much they would cost or who would pay for them, and they are not committed to (p. 14-189, 21-57). (WPU-Gerrard)

Response: Subsequent to the certification of the DSEIS, an engineering feasibility study and design schematics were reviewed with New York City Transit (NYCT). This review concluded that the recommended stairway widenings, as well as the installation of an Americans with Disabilities Act (ADA)-compliant elevator, would be feasible. The description of the proposed stairway widenings and feasibility determination has been updated for this FSEIS. Since the projected impacts that prompted the stairway and elevator feasibility investigation would not occur until Phase 2 of the proposed project, no funding commitments are in place at this time. The City will coordinate with NYCT and the lead agency to ensure the proper mitigation would be implemented at the appropriate time and would add language to the RFP for Phase 2 of the project, as well as to the development agreement and/or other legally binding agreements, requiring the designated developer to fund the implementation of this mitigation.

Comment 64: The developer is relying on the MTA to provide additional bus service to the Willets Point “West” location. Willets Point “West” Mall will produce about 14,000 additional bus riders on an average weekday. At 56 people per bus (capacity) that would require the addition of 250 weekday buses (most spread out from 10 AM to 8 PM). What guarantee can the developer provide that the MTA can provide this level of added bus service? At the third meeting of the Building/Zoning Committee of Queens Community Board 7 the developer mentioned that they were working with the LIRR on using that service to provide some relief for the overcrowding their project will create on the No. 7 subway line. Has the developer analyzed the potential for utilizing the LIRR? If so, what have they found? And, how realistic is using the LIRR during peak commute hours? (WPU-Ketcham)

Response: Subsequent to the certification of the DSEIS, additional discussions with MTA NYCT took place regarding the potential bus service improvements beyond increasing service frequency of existing bus routes. Results of this coordination effort, which include both the MTA Bus Company and NYCT considering near-term extension of one bus route by each agency to Willets West and the Willets Point District, both agencies finding several conceptual bus routing options, which would be coupled with the necessary layover areas and stop locations, to be generally reasonable and feasible, and both agreeing to evaluate additional bus route extensions based on actual future demand. While no definitive plans have been made at this time, the City and the applicant will continue to

collaborate with the MTA NYCT after this environmental review process to ensure that adequate bus service improvements would be implemented.

With regard to the LIRR, as stated in the response to Comment 43, the City has consulted with the MTA on extending regular LIRR service along its Port Washington Branch to the Willets Point LIRR station when the actual demand shows that such service improvement is warranted. However, no definitive commitments have been made at this time.

CONSTRUCTION

Comment 65: Is this land, where the mall is to be built, stable enough to support the structures? The area was originally wetland. (Auburndale)

Response: Prior to commencement of construction, full geotechnical studies and reports would be conducted for the Willets West land to determine appropriate construction methods and guarantee structural stability of proposed buildings. The developer has experience constructing on land with similar (if not the same) subsurface conditions at CitiField adjacent to Willets West, which was completed in 2009, and will draw upon its experience constructing CitiField in constructing the entertainment and retail facility at Willets West.

ALTERNATIVES

Comment 66: The City rejected my request to study an alternative that looks at the project without any eminent domain. This alternative should have been studied, for only that way can the reader understand whether or not this condemnation is truly necessary. The possibility of leaving untouched any properties whose owners will not sell voluntarily becomes more feasible in view of the City's new plan to use much of Willets Point as a parking lot. (WPU-Gerrard)

If phasing [of the project] is now possible, the FSEIS should consider an alternative in which certain properties (especially those being acquired from private parties) are excluded from the early phases. (WPU-Gerrard)

Response: As described in the *CEQR Technical Manual*, the purpose of the alternatives analysis is to consider a range of reasonable alternatives to the proposed project that have the potential to reduce or eliminate a proposed project's impacts, while considering the goals and objectives of the proposed actions. As noted in the DSEIS, since the 2008 approval of the Plan, the City has undertaken outreach and has been negotiating with property owners in the Willets Point District. Through negotiated acquisition, the City has acquired, or is in contract to purchase, approximately 95 percent of the land area within the proposed Phase 1A/1B footprint (Assemblage Option 2). The City would continue its outreach efforts as the development of the District moves forward. The analysis of a no-condemnation alternative would not result in meaningful differences in the

Willets Point Development

overall environmental impacts resulting from development pursuant to the District's Urban Renewal Plan through either condemnation or negotiated acquisition. Furthermore, the potential for development of individual properties and their various development timelines present myriad challenges in the general ability to meet project goals under the comprehensive redevelopment plan, particularly as they relate to the implementation of comprehensive site remediation; need for grade transitions to the new floodplain elevations; integration of the Phase 2 parcels into the planned water, sewer, and drainage infrastructure as well as the street network.

✱

Appendix A-1
Proposed Zoning Text Amendment

PROPOSED ZONING TEXT AMENDMENT

Willets Point Development Roosevelt Avenue to Northern Boulevard between 126th Street and 127th Street/Willets Point Blvd/MTA Property Queens, New York

Matter in underline is new, to be added;

Matter in ~~strikeout~~ is to be deleted

Matter with # # is defined in Section 12-10

* * * indicates where unchanged text appears in the Zoning Resolution

124-60

SPECIAL PERMIT TO MODIFY USE OR BULK REGULATIONS

For any #zoning lot# within the #Special Willets Point District#, the City Planning Commission may permit modification of the #use# or #bulk# regulations, except #floor area ratio# provisions, provided the Commission shall find that such:

(a) #use# or #bulk# modification shall aid in achieving the general purposes and intent of the Special District;

(b) #use# modification shall encourage a lively pedestrian environment along the street, or is necessary for, and the only practicable way to achieve, the programmatic requirements of the development;

(c) #bulk# modifications shall enhance the distribution of #bulk# within the Special District;

(d) #bulk# modifications shall permit adequate access of light and air to surrounding streets; and

(e) #use# or #bulk# modification shall relate harmoniously to the character of the surrounding area.

Notwithstanding the foregoing, a #use# modification may include a #use# proposed as part of a phased development within the Special District, where the Commission finds that such #use# is reasonably necessary for transitional purposes to assist in achievement the goals of the Special District, provided the findings of paragraphs (a), (b) and (e) above are met to the maximum extent possible, taking into account the nature of such #use#.

The Commission may prescribe appropriate conditions and safeguards to minimize adverse effects on the character of the surrounding area.

NEW YORK CITY WATERFRONT REVITALIZATION PROGRAM Consistency Assessment Form

Proposed action subject to CEQR, ULURP, or other Local, State or Federal Agency Discretionary Actions that are situated within New York City's designated Coastal Zone Boundary must be reviewed and assessed for their consistency with the *New York City Waterfront Revitalization Program (WRP)*. The WRP was adopted as a 197-a Plan by the Council of the City of New York on October 13, 1999, and approved in coordination with local, state and Federal laws and regulations, including the State's Coastal Management Program (Executive Law, Article 42) and the Federal Coastal Zone Management Act of 1972 (P.L. 92-583). As a result of these approvals, state and federal discretionary actions within the city's coastal zone must be consistent to the maximum extent practicable with the WRP policies and the city must be given the opportunity to comment on all state and federal projects within its coastal zone.

This form is intended to assist an applicant in certifying that the proposed activity is consistent with the WRP. It should be completed when the local, state, or federal application is prepared. The completed form and accompanying information will be used by the New York State Department of State, other State Agency or the New York City Department of City Planning in its review of the applicant's certification of consistency.

A. APPLICANT

1. Name:

Queens Development Group

Address:

c/o Jesse Masyr, Wachtel, Masyr & Missry, LLP, 1 Dag Hammarskjold Plaza, 47th Floor, New York, New York 10117

3. Telephone:

Fax:

212-909-9500

E-mail Address:

masyr@wmlp.com

4. Project site owner:

City of New York, various private entities

B. PROPOSED ACTIVITY

1. Brief description of activity:

See EAS page 1a.

2. Purpose of activity:

The proposed project would support the economic revitalization of the Willets Point neighborhood of Queens by converting large, surface parking lots into mixed-use residential, office, and commercial development. It would create new employment opportunities for local residents and would create economic and fiscal benefits to the City in the form of economic revitalization, increased employment opportunities, and tax revenue. In addition, the proposed project would provide approximately 8 acres of new publicly accessible open space and new community facilities and public school facilities, which would serve the surrounding neighborhood.

3. Location of activity:

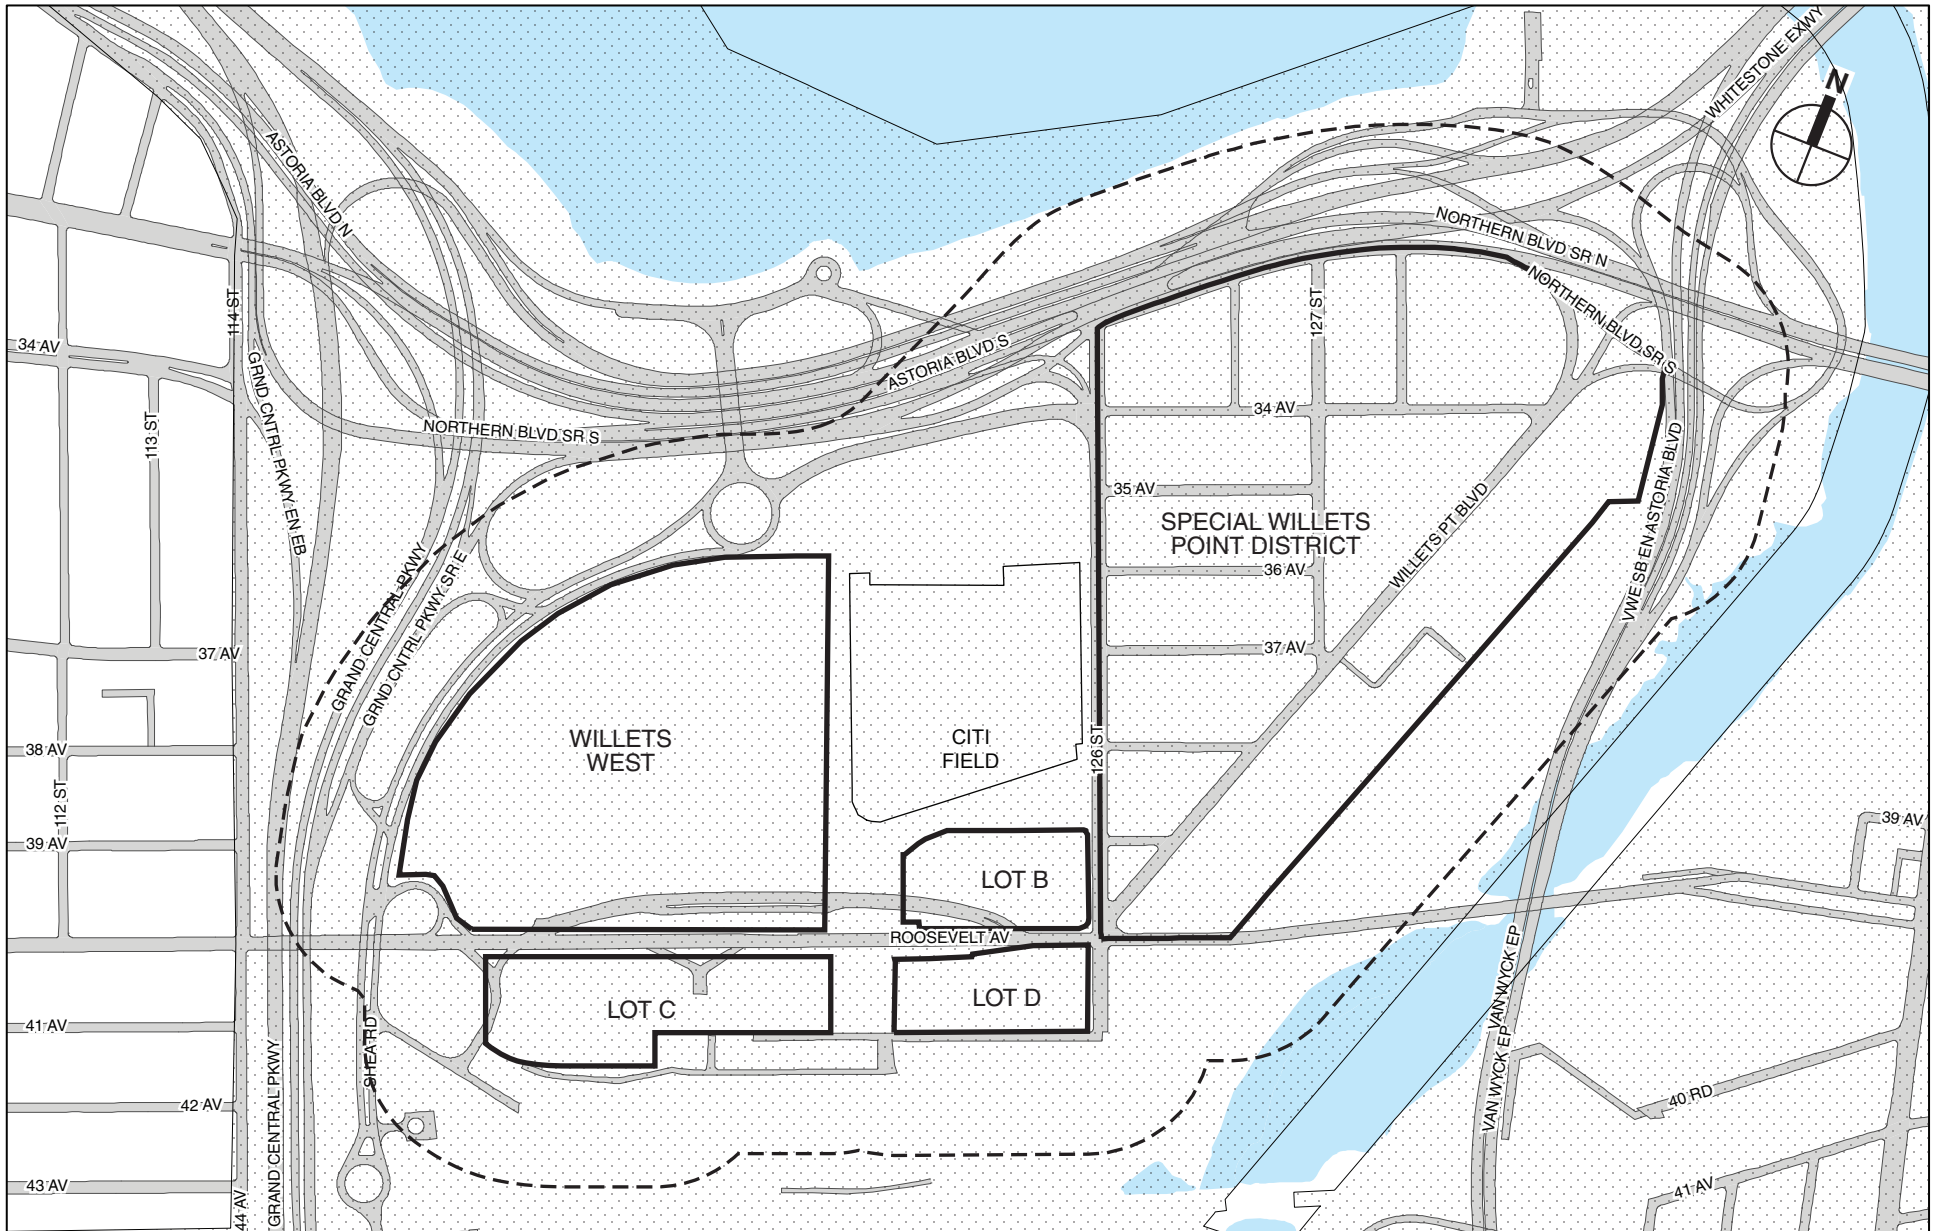

Borough:

See EAS page 1a.

Queens

Street Address or Site Description:

The project site is roughly bounded by Northern Boulevard, Shea Road, Roosevelt Avenue, and Willets Point Boulevard (see Figure A-1).

Figure A-1

Proposed Activity Cont'd

4. If a federal or state permit or license was issued or is required for the proposed activity, identify the permit type(s), the authorizing agency and provide the application or permit number(s), if known:

**Approval from Federal Aviation Administration (FAA) for building in proximity to LaGuardia Airport.
Approval by the New York City Industrial Development Agency (IDA) for the waiver of mortgage recording tax for property within the Special Willets Point District.**

5. Is federal or state funding being used to finance the project? If so, please identify the funding source(s).

No

6. Will the proposed project result in any large physical change to a site within the coastal area that will require the preparation of an environmental impact statement? **Yes** **No**

If yes, identify Lead Agency:

✓

Office of the Deputy Mayor for Economic Development (ODMED)

7. Identify City discretionary actions, such as **zoning amendment or adoption of an urban renewal plan**, required for the proposed project.

Special permit(s) to allow surface parking uses within the Special Willets Point District, and modification of the City's existing lease for the CitiField property and adjacent parking properties; Mayoral and Queens Borough Board approval of the business terms pursuant to New York Charter Section 384(b)(4); technical revisions to the previously-approved City Maps that modify the staging for the closure of City streets.

C. COASTAL ASSESSMENT

The following questions represent, in a broad sense, the policy of the WRP. The number in the parentheses after each question indicated the policy or policies that are the focus of the question. A detailed explanation of the Waterfront Revitalization Program and its policies are contained in the publication the *New York City Waterfront Revitalization Program*. Check either "Yes" or "No" for each of the following questions. Once the checklist is completed, assess how the proposed project affects the policy or standards indicated in "()" after each question with a Yes response. Explain how the action is consistent with the goals of the policy or standard.

Location Questions:

Yes

No

1. Is the project site on the waterfront or at the water's edge? **✓**
2. Does the proposed project require a waterfront site? **✓**
3. Would the action result in a physical alteration to a waterfront site, including land along the shoreline, land underwater, or coastal waters? **✓**

Policy Questions:

Yes

No

The following questions represent, in a broad sense, the policies of the WRP. Numbers in parentheses after each questions indicate the policy or policies addressed by the question. The new Waterfront Revitalization Program offers detailed explanations of the policies, including criteria for consistency determinations. Check either "Yes" or "No" for each of the following questions. For all "yes" responses, provide an attachment assessing the effects of the proposed activity on the relevant policies or standards. Explain how the action would be consistent with the goals of those policies and standards.

4. Will the proposed project result in revitalization or redevelopment of a deteriorated or under- used waterfront site? (1) **✓**
5. Is the project site appropriate for residential or commercial redevelopment? (1.1) **✓**
6. Will the action result in a change in scale or character of a neighborhood? (1.2) **✓**
7. Will the proposed activity require provision of new public services or infrastructure in undeveloped or sparsely populated sections of the coastal area? (1.3) **✓**

Policy Questions cont'd:		Yes	No
8.	Is the action located in one of the designated Significant Maritime and Industrial Areas (SMIA): South Bronx, Newtown Creek, Brooklyn Navy Yard, Red Hook, Sunset Park, or Staten Island? (2)	<hr/>	<hr/> ✓
9.	Are there any waterfront structures, such as piers, docks, bulkheads or wharves, located on the project sites? (2)	<hr/>	<hr/> ✓
10.	Would the action involve the siting or construction of a facility essential to the generation or transmission of energy, or a natural gas facility, or would it develop new energy resources? (2.1)	<hr/>	<hr/> ✓
11.	Does the action involve the siting of a working waterfront use outside of a SMIA? (2.2)	<hr/>	<hr/> ✓
12.	Does the proposed project involve infrastructure improvement, such as construction or repair of piers, docks, or bulkheads? (2.3, 3.2)	<hr/>	<hr/> ✓
13.	Would the action involve mining, dredging, or dredge disposal, or placement of dredged or fill materials in coastal waters? (2.3, 3.1, 4, 5.3, 6.3)	<hr/>	<hr/> ✓
14.	Would the action be located in a commercial or recreational boating center, such as City Island, Sheepshead Bay or Great Kills or an area devoted to water-dependent transportation? (3)	<hr/>	<hr/> ✓
15.	Would the proposed project have an adverse effect upon the land or water uses within a commercial or recreation boating center or water-dependent transportation center? (3.1)	<hr/>	<hr/> ✓
16.	Would the proposed project create any conflicts between commercial and recreational boating? (3.2)	<hr/>	<hr/> ✓
17.	Does the proposed project involve any boating activity that would have an impact on the aquatic environment or surrounding land and water uses? (3.3)	<hr/>	<hr/> ✓
18.	Is the action located in one of the designated Special Natural Waterfront Areas (SNWA): Long Island Sound-East River, Jamaica Bay, or Northwest Staten Island? (4 and 9.2) The project site is located within the Long Island Sound SNWA. Therefore, the project's consistency with Policies 4 and 9.2 will be analyzed in the SEIS.	<hr/> ✓	<hr/>
19.	Is the project site in or adjacent to a Significant Coastal Fish and Wildlife Habitats? (4.1)	<hr/>	<hr/> ✓
20.	Is the site located within or adjacent to a Recognized Ecological Complex: South Shore of Staten Island or Riverdale Natural Area District? (4.1 and 9.2)	<hr/>	<hr/> ✓
21.	Would the action involve any activity in or near a tidal or freshwater wetland? (4.2)	<hr/>	<hr/> ✓
22.	Does the project site contain a rare ecological community or would the proposed project affect a vulnerable plant, fish, or wildlife species? (4.3) The project's consistency with Policy 4.3 will be determined in the SEIS.	<hr/>	<hr/>
23.	Would the action have any effects on commercial or recreational use of fish resources? (4.4)	<hr/>	<hr/> ✓
24.	Would the proposed project in any way affect the water quality classification of nearby waters or be unable to be consistent with that classification? (5) The project's consistency with Policy 5 will be determined in the SEIS.	<hr/>	<hr/>
25.	Would the action result in any direct or indirect discharges, including toxins, hazardous substances, or other pollutants, effluent, or waste, into any waterbody? (5.1)	<hr/>	<hr/> ✓
26.	Would the action result in the draining of stormwater runoff or sewer overflows into coastal waters? (5.1) The project's consistency with Policy 5.1 will be addressed in the SEIS.	<hr/>	<hr/>
27.	Will any activity associated with the project generate nonpoint source pollution? (5.2)	<hr/>	<hr/> ✓

Policy Questions cont'd:		Yes	No
28.	Would the action cause violations of the National or State air quality standards? (5.2) The project's consistency with Policy 5.2 will be addressed in the SEIS.	<hr/>	<hr/>
29.	Would the action result in significant amounts of acid rain precursors (nitrates and sulfates)? (5.2C)	<hr/>	<hr/> <input checked="" type="checkbox"/>
30.	Will the project involve the excavation or placing of fill in or near navigable waters, marshes, estuaries, tidal marshes or other wetlands? (5.3) The project's consistency with Policy 5.3 will be addressed in the SEIS.	<hr/>	<hr/>
31.	Would the proposed action have any effects on surface or ground water supplies? (5.4)	<hr/>	<hr/> <input checked="" type="checkbox"/>
32.	Would the action result in any activities within a Federally designated flood hazard area or State designated erosion hazards area? (6) The project site lies within the 100-year flood boundary. Therefore, the project's consistency with Policy 6 will be addressed in the SEIS.	<hr/> <input checked="" type="checkbox"/>	<hr/>
33.	Would the action result in any construction activities that would lead to erosion? (6)	<hr/>	<hr/> <input checked="" type="checkbox"/>
34.	Would the action involve construction or reconstruction of flood or erosion control structure? (6.1)	<hr/>	<hr/> <input checked="" type="checkbox"/>
35.	Would the action involve any new or increased activity on or near any beach, dune, barrier island, or bluff? (6.1)	<hr/>	<hr/> <input checked="" type="checkbox"/>
36.	Does the proposed project involve use of public funds for flood prevention or erosion control? (6.2)	<hr/>	<hr/> <input checked="" type="checkbox"/>
37.	Would the proposed project affect a non-renewable source of sand? (6.3)	<hr/>	<hr/> <input checked="" type="checkbox"/>
38.	Would the action result in shipping, handling, or storing of solid wastes; hazardous materials, or other pollutants? (7)	<hr/>	<hr/> <input checked="" type="checkbox"/>
39.	Would the action affect any sites that have been used as landfills? (7.1) The project's consistency with Policy 7.1 will be addressed in the SEIS.	<hr/>	<hr/>
40.	Would the action result in development of a site that may contain contamination or has a history of underground fuel tanks, oil spills, or other form or petroleum product use or storage? (7.2) The historical uses and conditions on and off the project site indicate the potential for adverse impacts related to hazardous materials. Therefore, the project's consistency with Policy 7.2 will be addressed in the SEIS.	<hr/> <input checked="" type="checkbox"/>	<hr/>
41.	Will the proposed activity result in any transport, storage, treatment, or disposal of solid wastes or hazardous materials, or the siting of a solid or hazardous waste facility? (7.3) The remediation of the project site may require the treatment and/or disposal of solid wastes or hazardous materials. Therefore, the project's consistency with Policy 7.3 will be addressed in the SEIS.	<hr/>	<hr/>
42.	Would the action result in a reduction of existing or required access to or along coastal waters, public access areas, or public parks or open spaces? (8)	<hr/>	<hr/> <input checked="" type="checkbox"/>
43.	Will the proposed project affect or be located in, on, or adjacent to any federal, state, or city park or other land in public ownership protected for open space preservation? (8) A portion of the project is located within the boundaries of Flushing Meadows Corona Park. Therefore, the project's consistency with Policy 8 will be addressed in the SEIS.	<hr/> <input checked="" type="checkbox"/>	<hr/>
44.	Would the action result in the provision of open space without the provision for its maintenance? (8.1)	<hr/>	<hr/> <input checked="" type="checkbox"/>
45.	Would the action result in any development along the shoreline but NOT include new water enhanced or water dependent recreational space? (8.2)	<hr/>	<hr/> <input checked="" type="checkbox"/>
46.	Will the proposed project impede visual access to coastal lands, waters and open space? (8.3) The project's consistency with Policy 8.3 will be addressed in the SEIS.	<hr/>	<hr/>
47.	Does the proposed project involve publically owned or acquired land that could accommodate waterfront open space or recreation? (8.4)	<hr/>	<hr/> <input checked="" type="checkbox"/>
48.	Does the project site involve lands or waters held in public trust by the state or city? (8.5)	<hr/>	<hr/> <input checked="" type="checkbox"/>

Policy Questions cont'd:**Yes****No**

49. Would the action affect natural or built resources that contribute to the scenic quality of a coastal area? (9) _____ ✓ _____
50. Does the site currently include elements that degrade the area's scenic quality or block views to the water? (9.1) **The project's consistency with Policy 9.1 will be addressed in the SEIS.** _____ ✓ _____
51. Would the proposed action have a significant adverse impact on historic, archeological, or cultural resources? (10) **As disclosed in the FGEIS, the proposed project would demolish the former Empire Millwork Corporation Building, which has been determined eligible for listing on the New York State and National Registers of Historic Places (S/NR), and thus would have a significant adverse impact on historic resources.** _____ ✓ _____
52. Will the proposed activity affect or be located in, on, or adjacent to an historic resource listed on the National or State Register of Historic Places, or designated as a landmark by the City of New York? (10) _____ ✓ _____

D. CERTIFICATION

The applicant must certify that the proposed activity is consistent with New York City's Waterfront Revitalization Program, pursuant to the New York State Coastal Management Program. If this certification cannot be made, the proposed activity shall not be undertaken. If the certification can be made, complete this section.

"The proposed activity complies with New York State's Coastal Management Program as expressed in New York City's approved Local Waterfront Revitalization Program, pursuant to New York State's Coastal Management Program, and will be conducted in a manner consistent with such program."

COMMENTS

The LPC is in receipt of the draft EAS and draft scope of work for EIS (SEIS) dated 2/2/07. Based on these documents and the block/lot list provided by EDC, no architectural or archaeological resources have been identified on the project site or in the project study area. This information should be disclosed in the EAS and SEIS.

Dear Ms. Jones,

Thank you for requesting the comments of the New York State Office of Parks, Recreation and Historic Preservation (OPRHP) with regard to the potential for this project to affect significant historical/cultural resources. OPRHP has reviewed the Phase 1 Archaeological report prepared and submitted for this project. Based on our review of that report, the OPRHP has no further archaeological concerns regarding this project.

Please note that if state and or federal permits are necessary, the project will need to be reviewed in accordance with Section 14.09 of the State Historic Preservation Act or Section 106 of the National Historic Preservation Act. While archaeological issues with the site have been addressed, please continue to consult with our technical review staff regarding architectural resources.

Please contact me at extension 3291, or by e-mail at douglas.mackey@oprhp.state.ny.us, if you have any questions regarding these comments.

Sincerely

Douglas P. Mackey
Historic Preservation Program Analyst

COMMENTS

The LPC is in receipt of the full DEIS for this project dated November 13, 2001. The text is acceptable. Please note that the Candela Structures, built in 1964 and eligible for LPC designation, are not eligible for listing on the State and National Registers, as such properties must be at least 50 years old.

COMMENTS

The LPC is in receipt of Chapter 6, "Historic Resources" of the DEIS dated 10/01. Within the project study area and listed as a potential historic resource are the Candela bus shelters. They appear eligible for designation as NYC landmarks. No adverse impacts are anticipated to the structures as a result of the action.

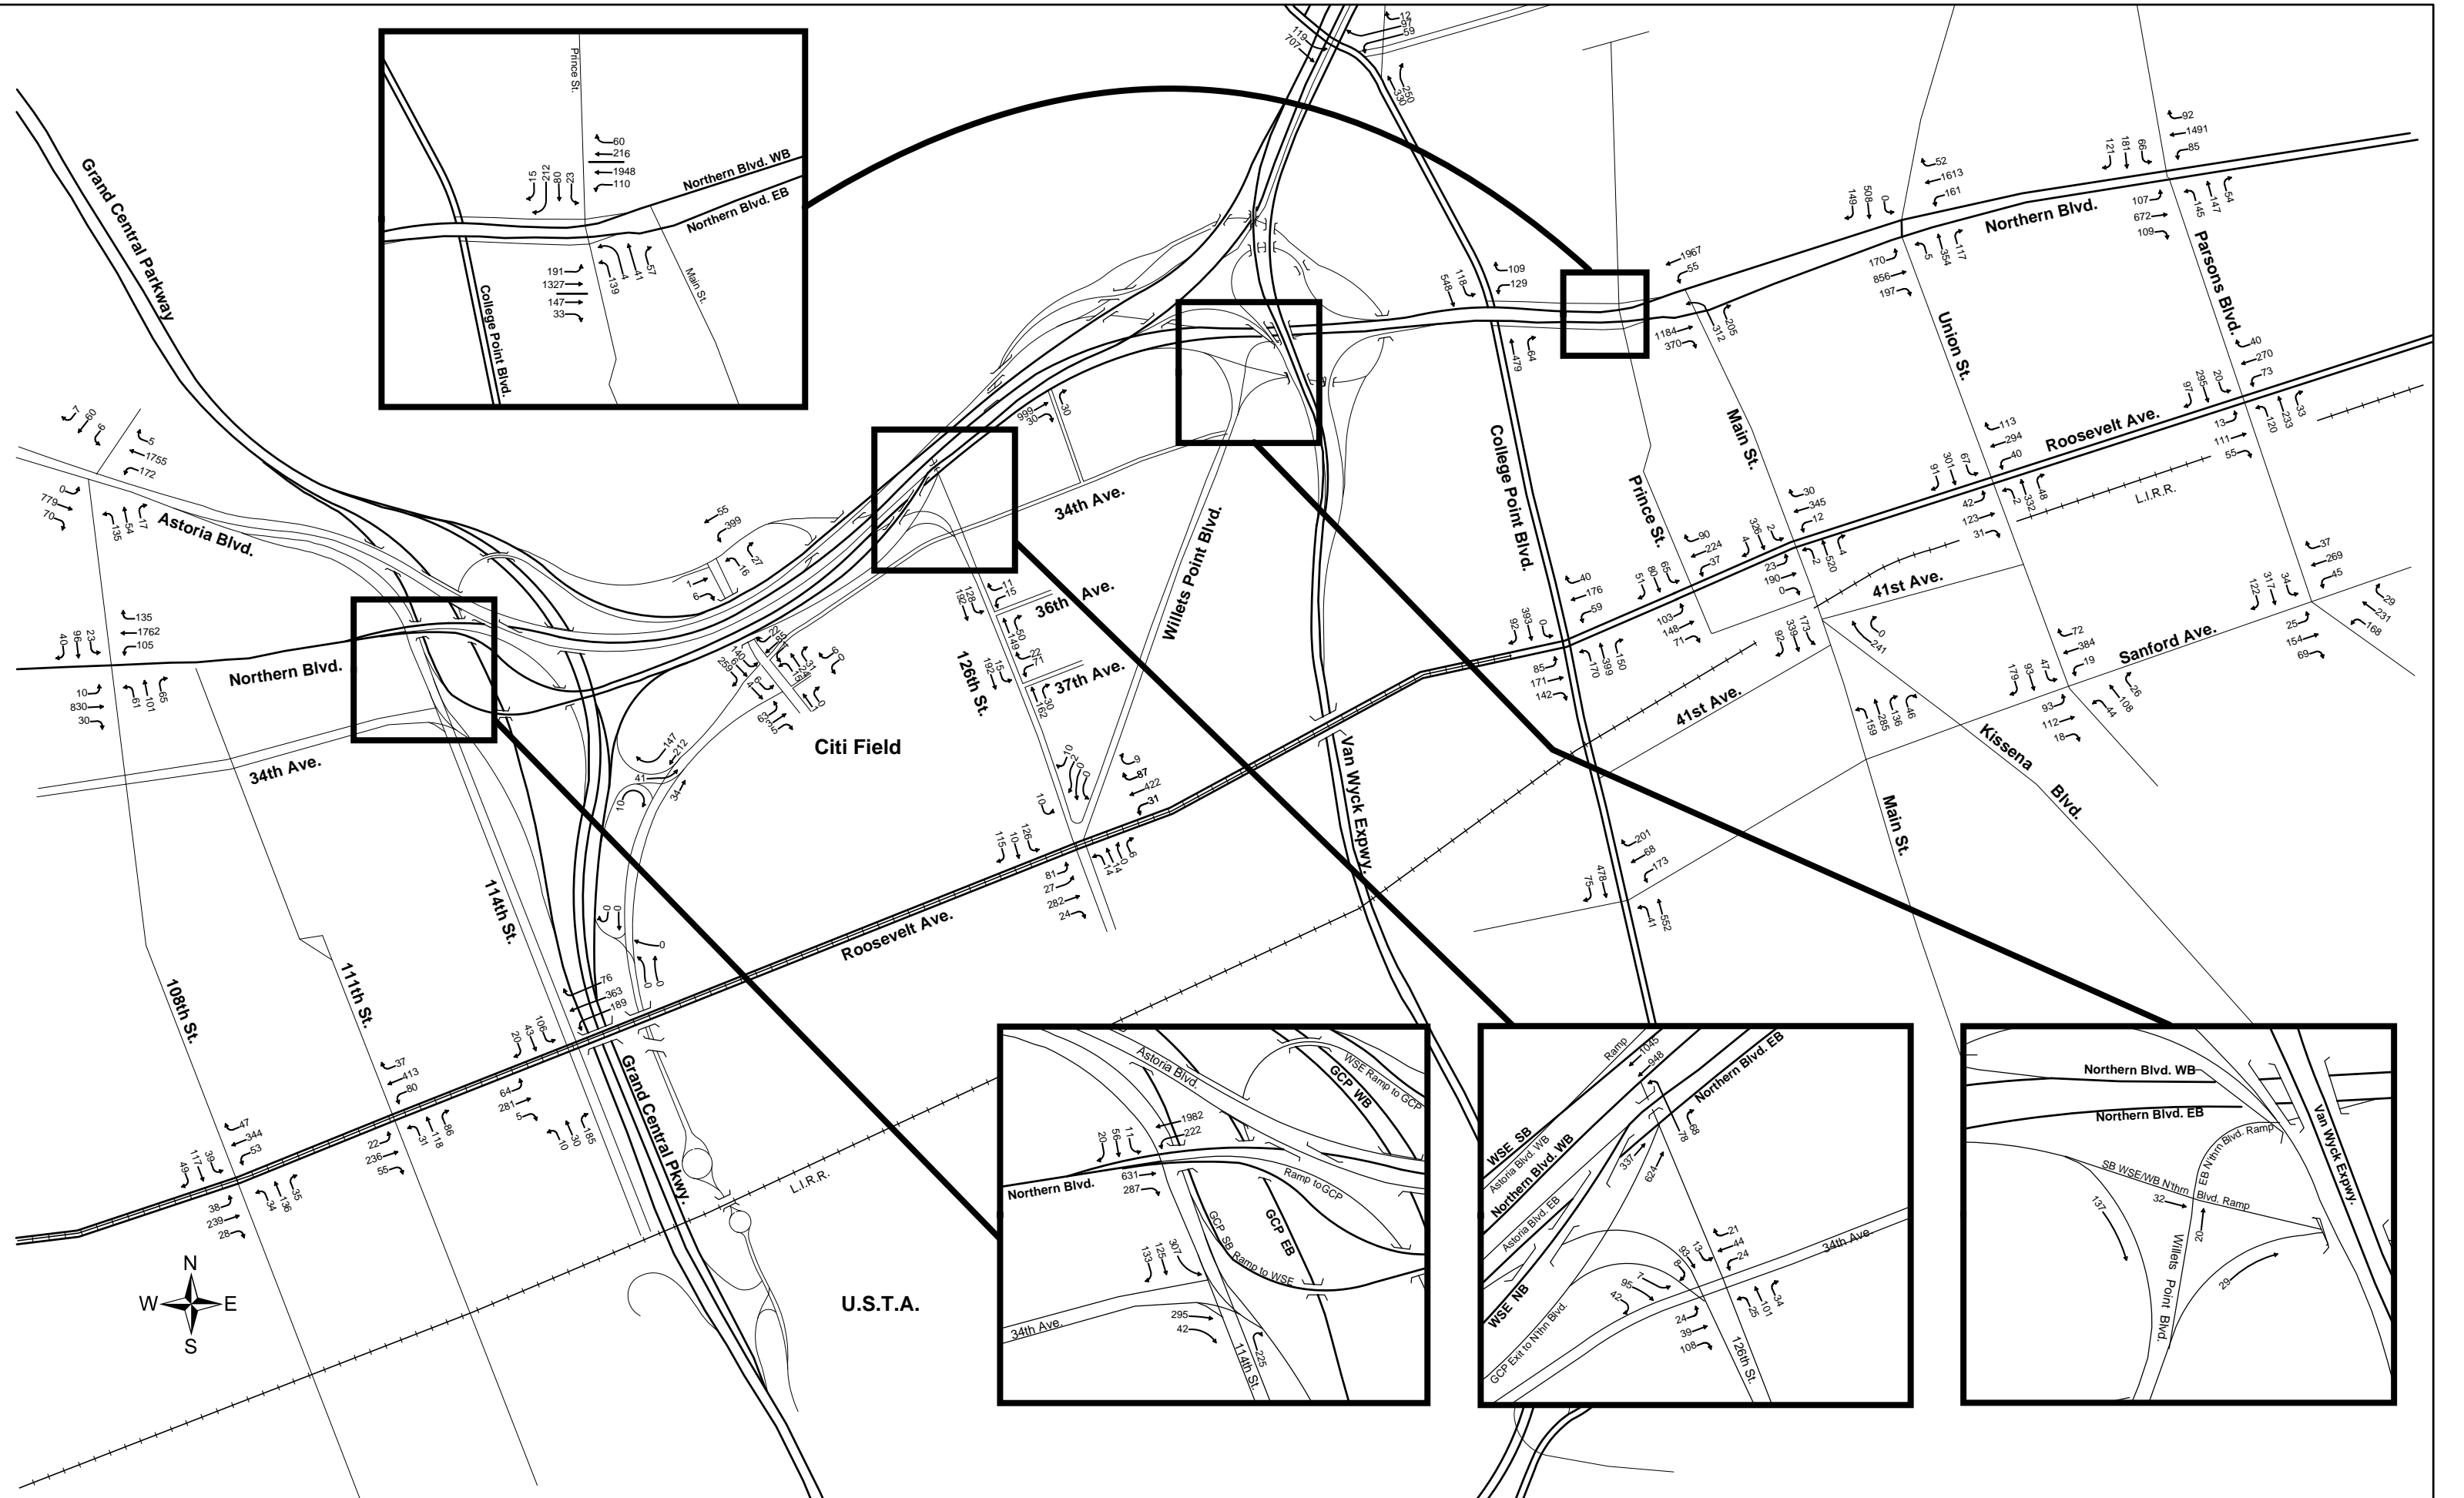

The LPC is in receipt of The Stage 1A Archaeological Assessment for Shea Stadium Redevelopment dated October 2001 and prepared by Historical Perspectives Inc. The LPC concurs that there are no further concerns. Please submit three bound copies of the study for archival distribution.

Notes

- (1): Control delay is measured in seconds per vehicle.
- (2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.
- (3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".
- (4): This table has been revised for the Final SEIS.

TABLE G - 1
CITIFIELD - WILLETS POINT DEVELOPMENT STUDY
2031 PHASE 2 CONSTRUCTION WEEKDAY NON-GAME 6-7 AM NO ACTION VS WITH ACTION TRAFFIC LEVELS OF SERVICE COMPARISON

															Mitigation Measure
		No Action				With Action				Mitigation					
INTERSECTION & APPROACH		Mvt.	V/C	Control Delay	LOS	Mvt.	V/C	Control Delay	LOS	Mvt.	V/C	Control Delay	LOS

Overall Intersection		-	-	-	-	-	0.29	14.9	B					

Notes

(1): Control delay is measured in seconds per vehicle.

(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.

(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

(4): This table has been revised for the Final SEIS.

Overall Intersection		-	-	-	-	-	1.27	40.3	D					

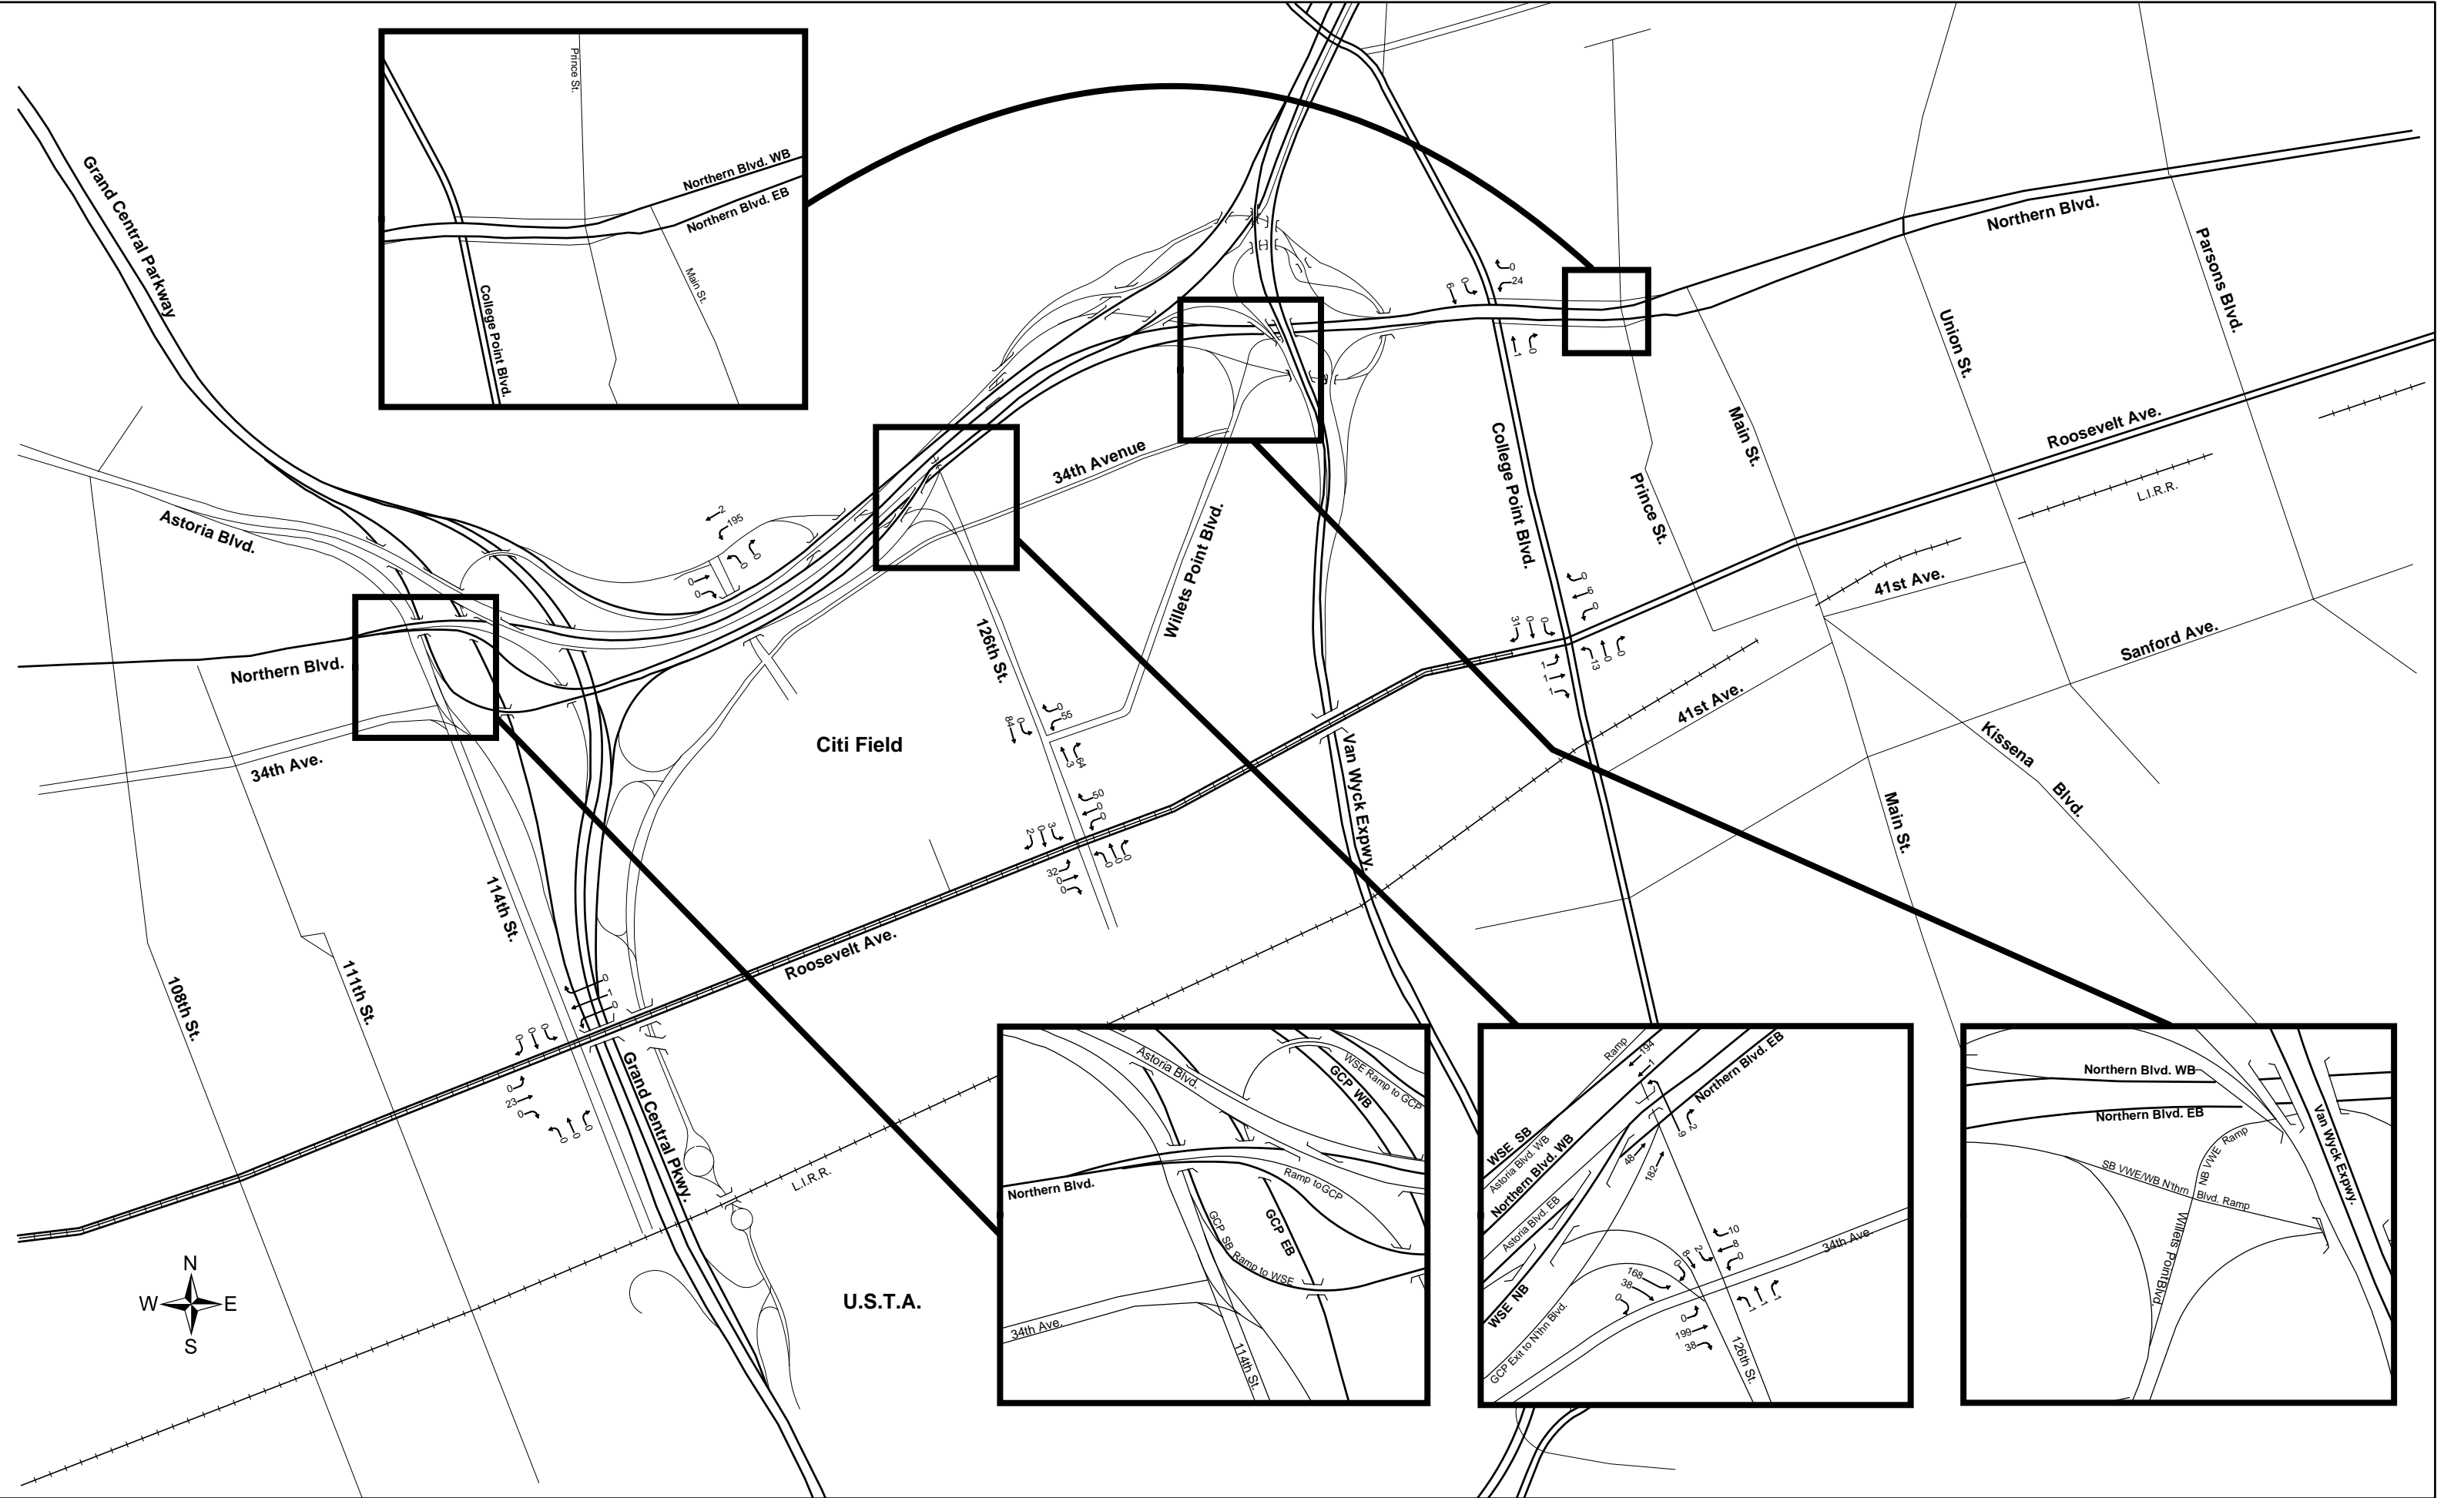

Notes

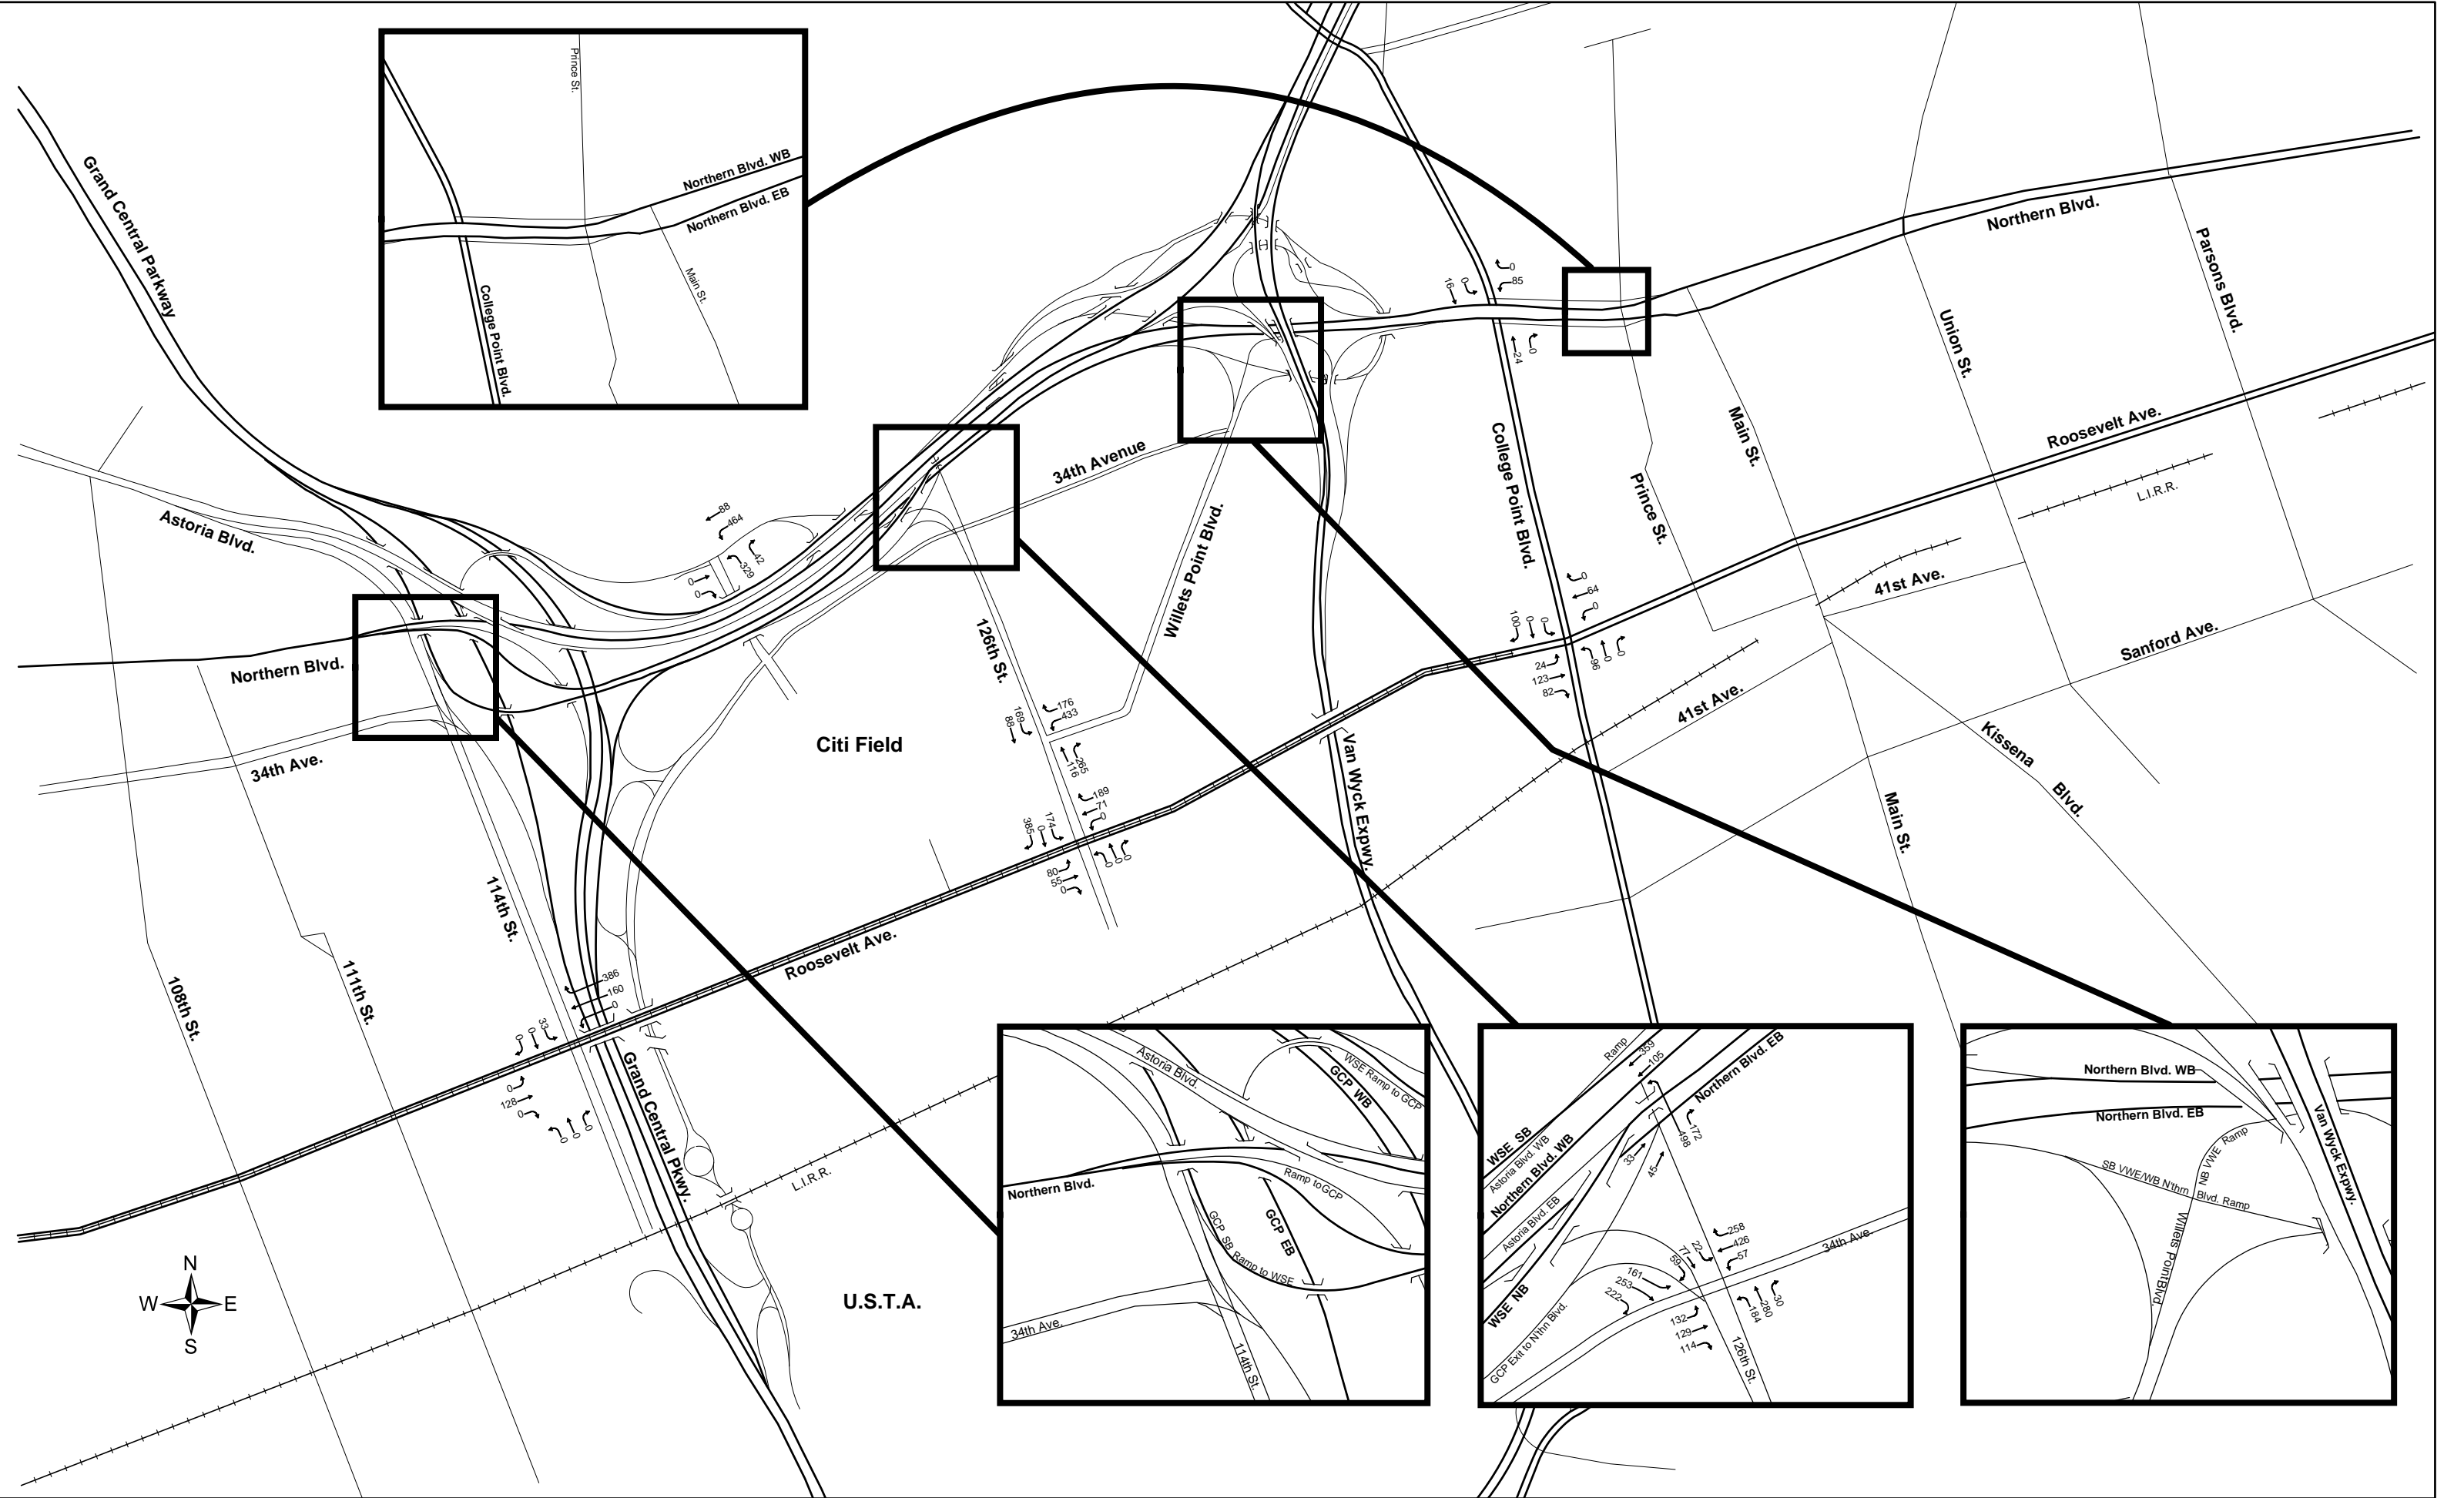

- (1): Control delay is measured in seconds per vehicle.
(2): Overall intersection V/C ratio is the critical lane groups' V/C ratio.
(3): V/C ratios above 1.20 represent saturated conditions and, at several locations, result in predicted average vehicle delays in the 1,000 to 4,000+ second range for signalized intersections and 1,000 to 10,000+ second range for unsignalized intersections. These are theoretical HCM-generated outputs that may, in fact, overestimate delays for such conditions. Lane groups reflecting these conditions are presented in the tables as having delays of "1,000+" seconds and v/c ratios of approximately "3.00+".

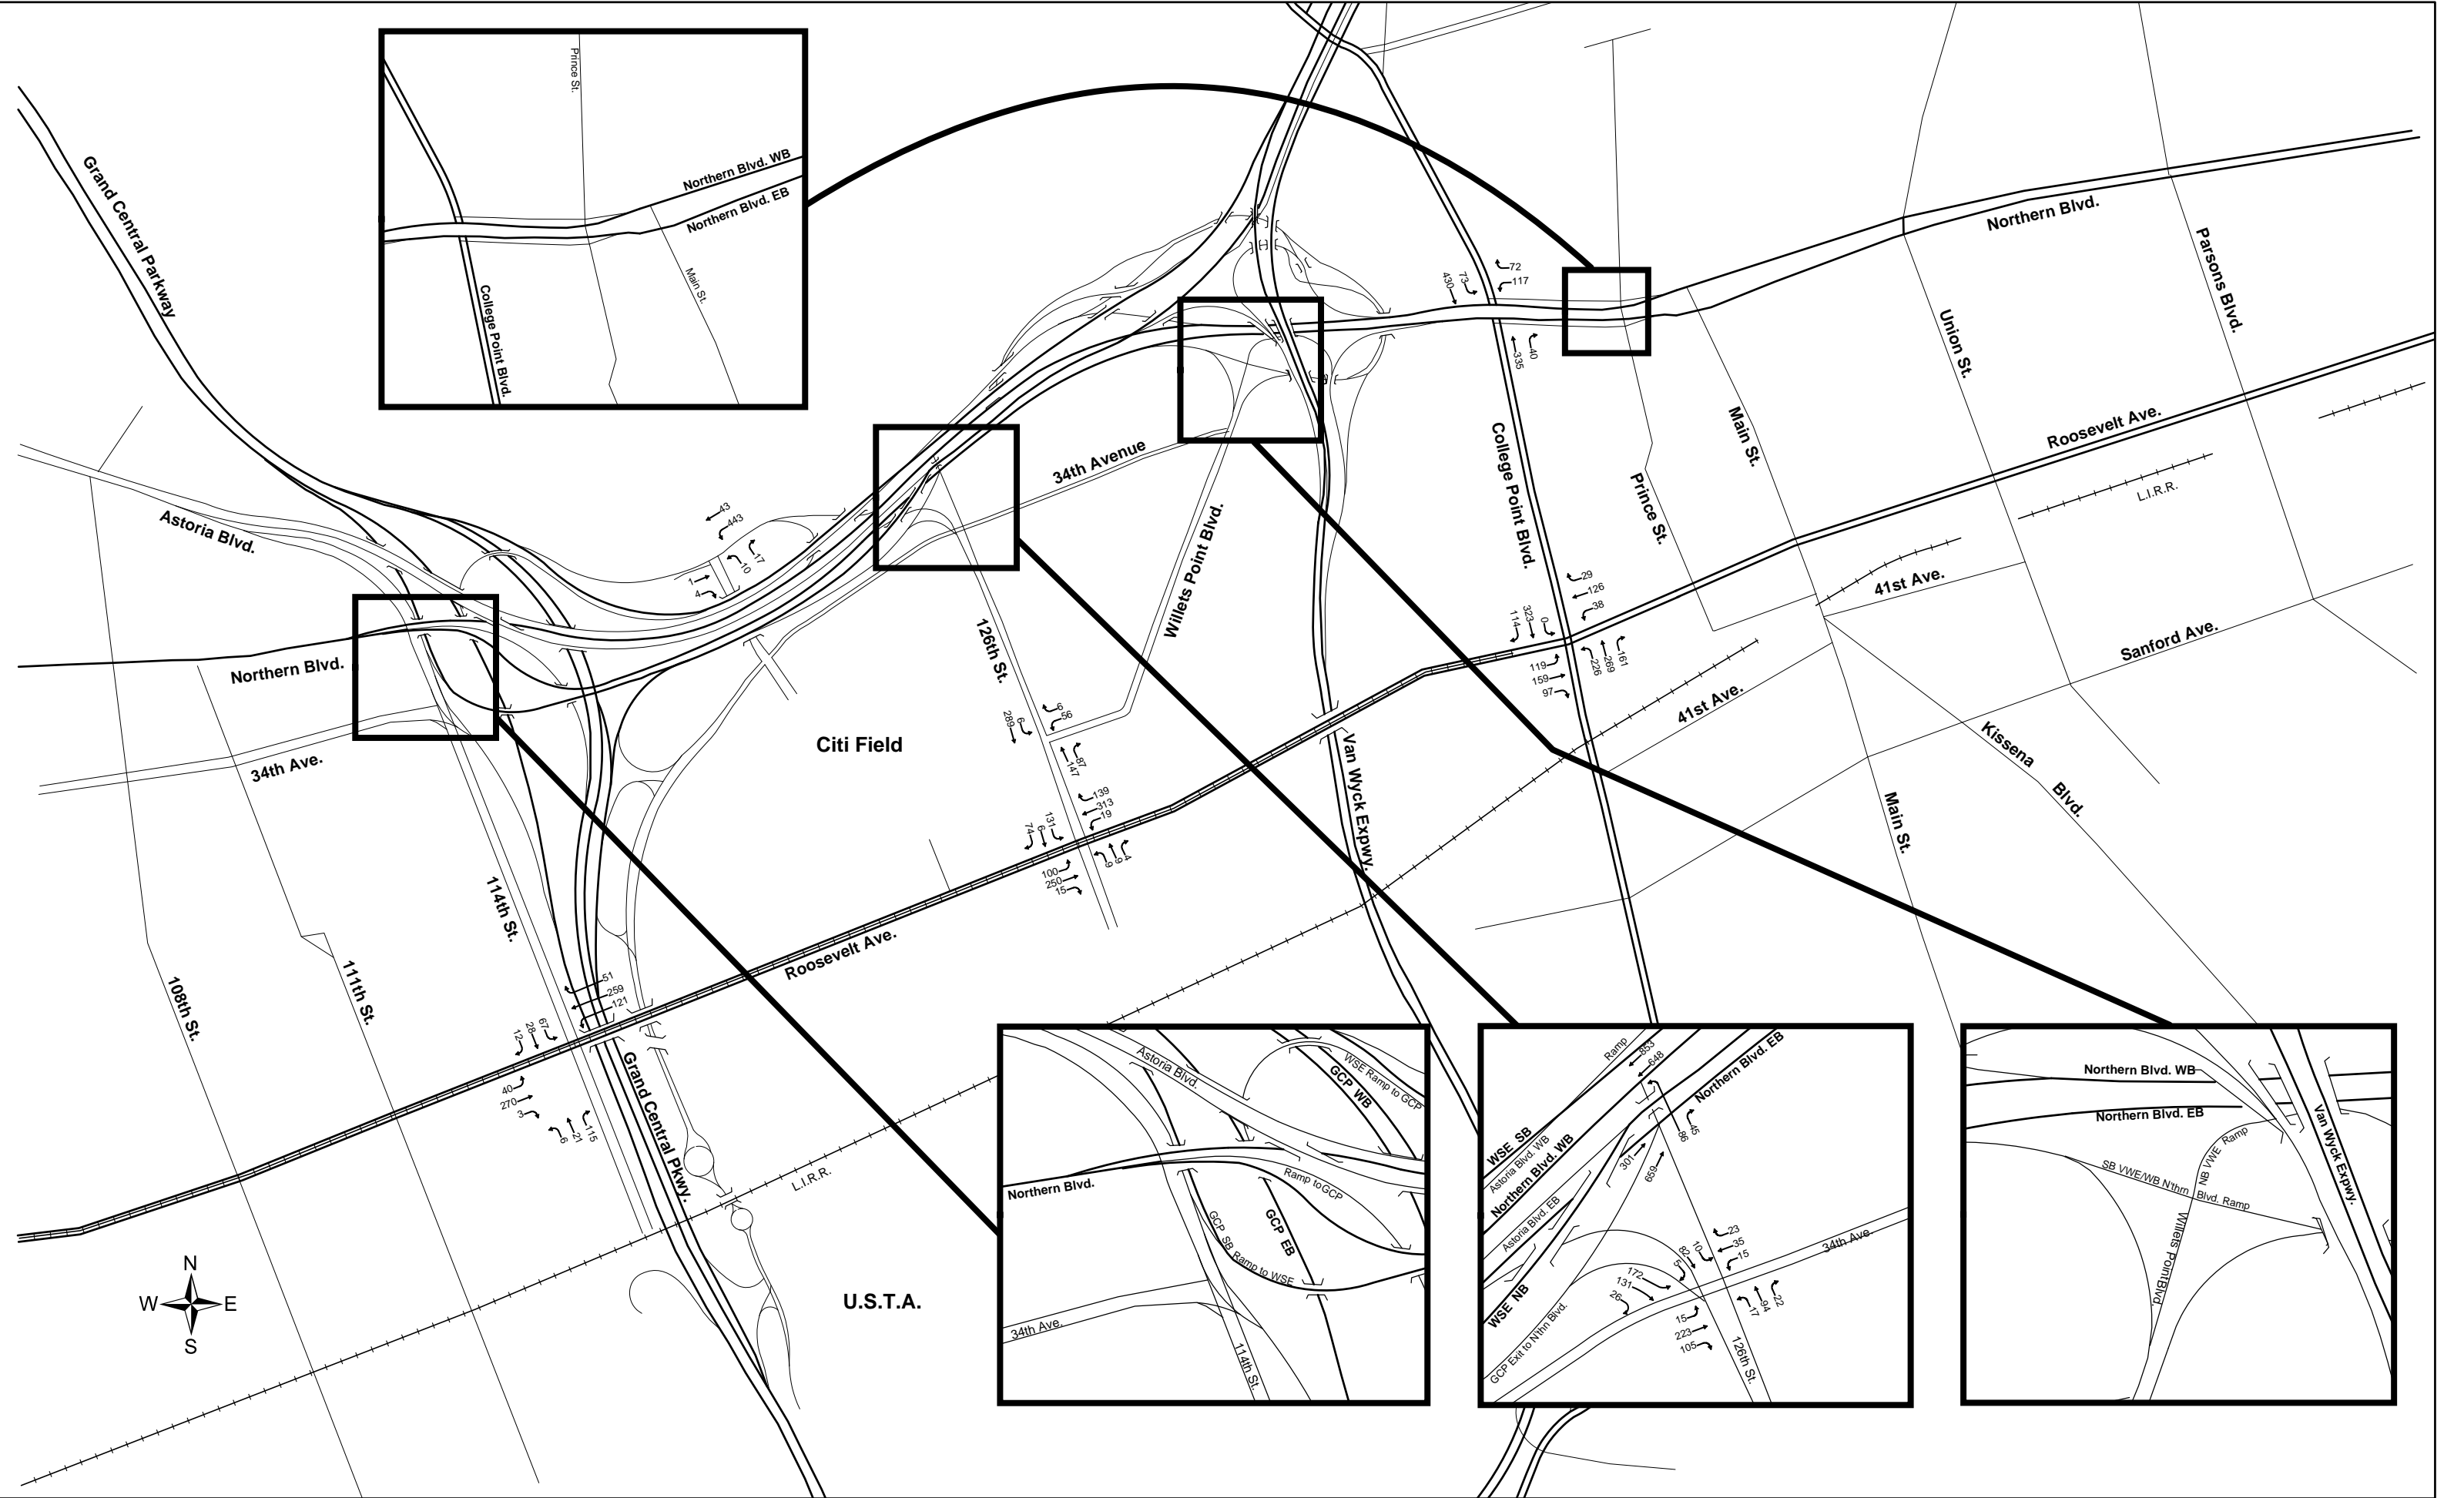

(4): This table has been revised for the Final SEIS.

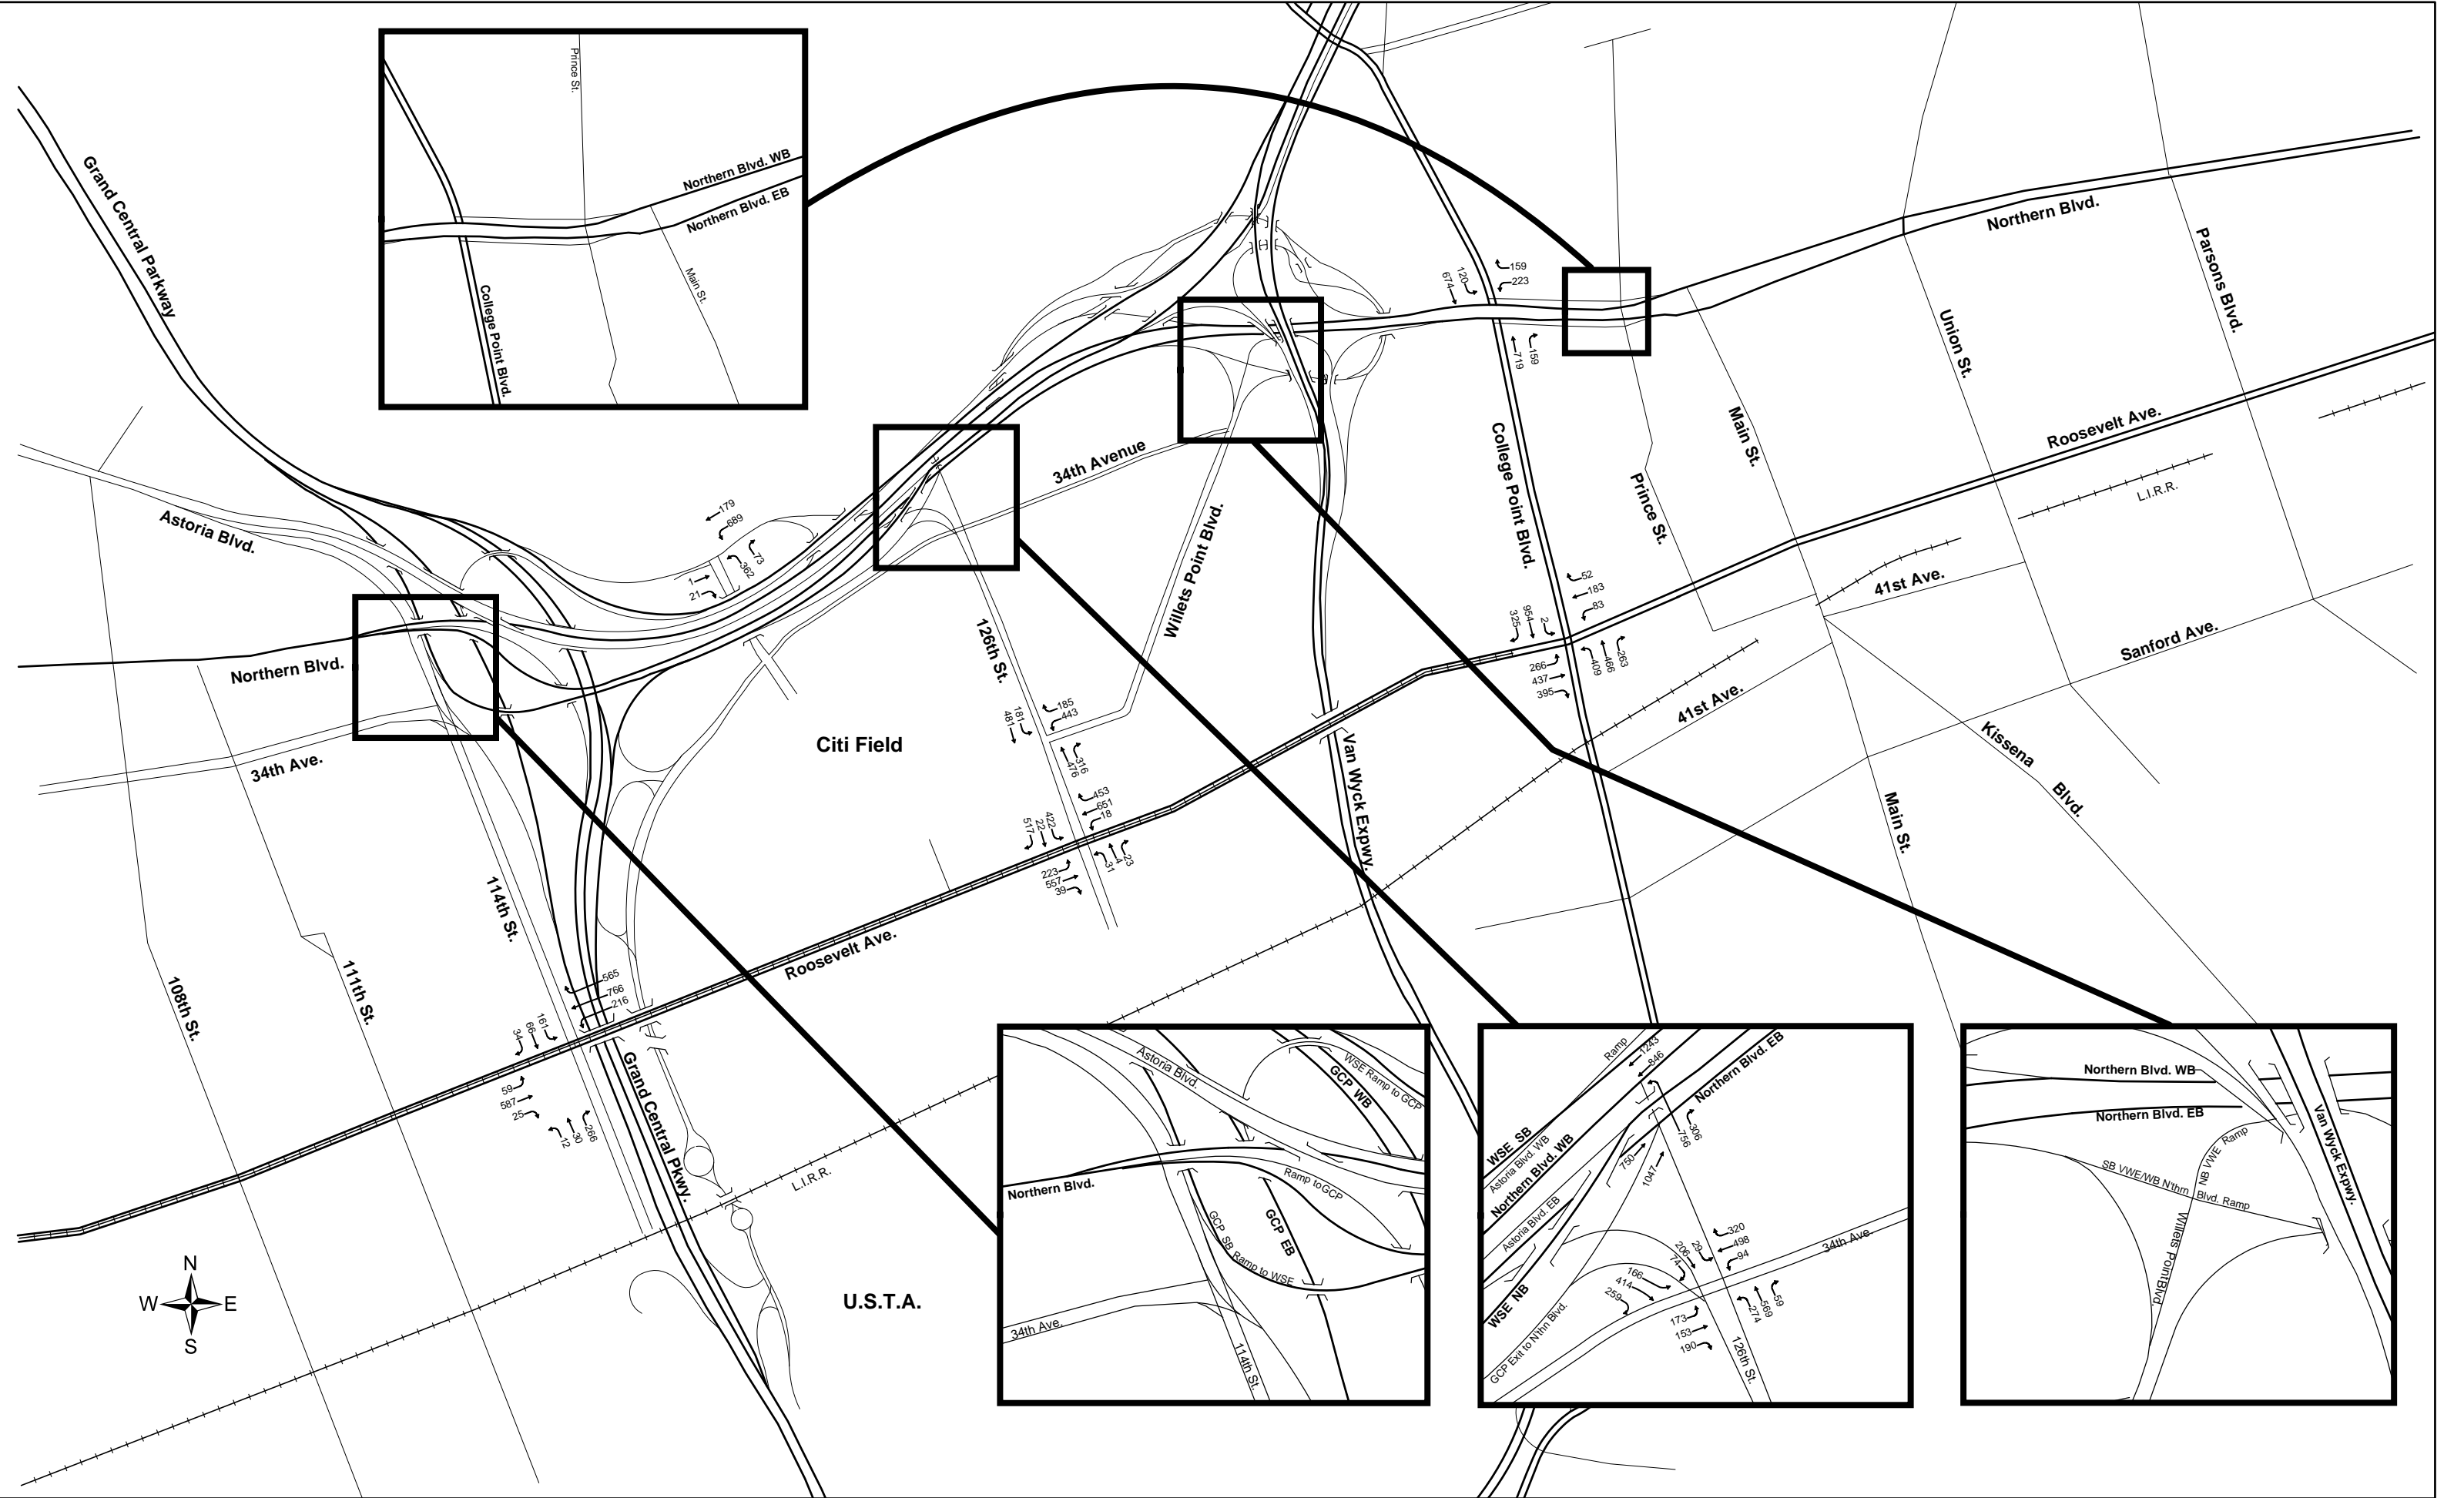

Short-Term (24-Hour Average) PM_{2.5} Construction Emissions Profile

THE CALENDAR OFFICER: Borough of Queens, calendar numbers 38 through 42. Calendar number 38, N 130220 ZRQ. Calendar number 39, C 130222 ZSQ. Calendar number 40, C 130223 ZSQ. Calendar number 41, C 130224 ZSQ. Calendar number 42, C 130225 ZSQ.

THE CHAIR: Since it is located on parkland, we felt it was important for Bob to be here to listen to any public comments regarding the Willets West aspect of the project, and as well as general comments regarding the environmental review.

Just to make it clear, our purview of City Planning Commission really is on the Willets East part of the project, and the temporary term uses there. But Mr. Kulikowski is hearing testimony on any components to deal with the Willets West component of the project.

Now we'll begin to call speakers. As is our custom, since there are speakers for and against, we will go for 30 minutes for speakers in favor, then we will switch to speakers in

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 opposition. And the first speaker in favor is Rob
3 Goldrich, who will be followed by David Quart,
4 Richard Browne, Jesse Masyr and John Clifford.

5 MR. GOLDRICH: Thank you, Madam
6 Commissioner, hello. Hello, Commissioners. Hello
7 Bob Kulikowski from the panel, very exciting to
8 see you there.

9 I'm Bob Goldrich, senior policy
10 advisor from the mayor's office. And I'm here on
11 behalf of Deputy Mayor Bob Steel to speak in favor
12 of this project today, and introduce the City
13 speakers and the development team.

14 The administration is very excited
15 to have a real way forward and finally feasibly
16 realize the vision that the City, along with the
17 City Planning Commission support, approved back in
18 2008. As you know, the Willets Point development
19 plan is an historic redevelopment effort that will
20 finally transform and revitalize a polluted and
21 neglected neighborhood, a goal that has alluded
22 the City for generations. The plan will clean up
23 decades of toxic pollution, and help improve the
24 quality of nearby waterways. It will provide the
25 Willets Point district, located in one of the most

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 vibrant parts of Queens, with basic infrastructure
3 that it now lacks. In addition, it will establish
4 a major new, mixed income neighborhood and
5 commercial destination, while creating thousands
6 of jobs and infusing billions in private
7 investment into the local community.

8 The City's agreement with the
9 joint venture development team will result in
10 construction as originally envisioned in the
11 Special Willets Point District and urban renewal
12 plan when environmental remediation on even more
13 acreage than was originally anticipated in the
14 2011 RFP. The plan will activate significant
15 acreage on both sides of City Field to create a
16 true center of economic growth for Queens.

17 The first phase of the project will
18 encompass 23 of the 62 acres which will make up
19 the district, will result in \$3 million in private
20 investment, create 7,100 permanent jobs, and
21 12,000 direct construction jobs, with MW/BE and
22 local hiring goals at 25 percent. During
23 construction the project will generate over \$310
24 million in tax revenue. And once operational,
25 will account for over \$150 million in new annual

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 tax revenue. You will hear from the applicants
3 and New York City's Economic Development
4 Corporation in a joint venture between Related and
5 Sterling Equities, as well as their consultants
6 who are here today to address questions and
7 concerns that you may have.

8 So I'm here to answer any
9 questions as well or just hand it off to the next
10 speakers.

11 THE CHAIR: Let me see if there are
12 any for Rob Goldrich. Yes, Michelle and then
13 Angela.

14 COMM. DE LA UZ: Thanks for being
15 here.

16 MR. GOLDRICH: Thanks, Commissioner.

17 COMM. DE LA UZ: I'm wondering if
18 you could speak to what efforts the City has made
19 to work with the existing business owners that are
20 going to be displaced as a result of the
21 remediation.

22 MR. GOLDRICH: The City has been
23 working very closely with City Council Member
24 Julissa Ferreras, and HPD, who is both property
25 manager, and with EDC, to come up with a plan to

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 fairly relocate and help to relocate the existing
3 businesses. The City owns about 95 percent of the
4 land currently in Willets Point, maybe a little
5 bit more than that right now. We're the property
6 manager for those properties. And we've been
7 engaging with Cornerstones, and David Quart will
8 be here to speak afterwards, and probably give a
9 little more detail, who is a broker and a
10 consultant that helps source properties and
11 relocations for the businesses. They have been
12 engaged with the businesses for a period of time
13 already, and will continue to do so. The council
14 member has also been very active with us to see if
15 we can come up with any kind of supplemental
16 relocation on top of what the City would normally
17 provide, as obligated under the law to relocate
18 businesses who will be evicted. So we are in
19 current discussions with OMB and with the council
20 member to come up with a plan to supplement what
21 was already agreed upon.

22 THE CHAIR: Angela.

23 COMM. BATTAGLIA: So that would have
24 been my question, but it gives me an opportunity
25 to say welcome.

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

10

2

MR. GOLDRICH: Thanks.

3

4

5

COMM. BATTAGLIA: I always like when
the mayor's office presents. That's how I got to
meet Matt LaBule (phonetic) when I was --

6

7

8

MR. GOLDRICH: I sit in Matt
LaBule's old chair. I have his old phone number,
so.

9

(Laughter)

10

11

COMM. BATTAGLIA: Thank you for
coming today.

12

MR. GOLDRICH: Thanks.

13

THE CHAIR: Vice Chair Knuckles.

14

15

16

17

THE VICE CHAIR: Sir, approximately
how many businesses are impacted by this? I'm
sure we were told this at one point but I just
don't remember.

18

19

20

21

22

23

24

25

MR. GOLDRICH: I'm going to let
David Quart get into that, but it's -- I believe
it's less than a hundred businesses that will have
to be re -- that will have to move. Willets Point
is sort of -- it's an area where there are -- in
one property you could have a number of different
businesses. You may have one business that's on
the lease, but you also have many other smaller

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

11

2 businesses that sit within a building. So it's
3 very complicated. So to answer the numbers
4 exactly I think is a moving target, but David
5 Quart can probably give you more.

6 THE VICE CHAIR: Is it the sense
7 of the City, without perhaps knowing specifically
8 where, but is it the sense of the City that all of
9 these businesses can ultimately be relocated
10 somewhere?

11 MR. GOLDRICH: There have been -- a
12 number of the businesses have tried to, are
13 interested in co-locating. There are a lot of
14 auto businesses there. Some of the businesses
15 will do tires, some other businesses will do other
16 parts of the car. So it's been great for them to
17 all be located currently in Willets Point where
18 someone can come to the windshield place and the
19 tire to another place and so on.

20 Cornerstone has been working to find
21 sites to co-locate businesses, and have also been
22 working to find smaller sites to locate businesses
23 individually. There are -- there have been a
24 whole analysis as to rents, how -- where they are
25 now, what they are in other locations. And

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 clearly, Willets Point and the conditions that
3 there are, the rents are lower than they are in
4 other parts of the City, but there are options
5 that are available. I'm not sure if everyone will
6 be able to find a new place in terms of being --
7 the economic feasibility to the specific business.
8 But that is the hope and that's what we have been
9 working with, working towards.

10 THE VICE CHAIR: Thank you.

11 THE CHAIR: Any other questions?

12 COMM. CANTOR: Good afternoon. You
13 made the observation that the City owned about 95
14 percent of the parcels?

15 MR. GOLDRICH: In phase one.

16 COMM. CANTOR: In phase one.

17 MR. GOLDRICH: Yes, sir.

18 COMM. CANTOR: And then you
19 responded that there are about a hundred
20 businesses affected. Is that the remaining five
21 percent?

22 MR. GOLDRICH: No, that's -- I think
23 that would include -- that roughly a hundred
24 businesses is -- would be the entire 23 acres in
25 phase one. The businesses that we have been

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 engaged with so far have only been the ones where
3 we are currently the property manager. We're not
4 allowed to work to relocate tenants in businesses
5 in buildings that we do not own yet. That's -- we
6 are forbidden to sort of get between a landlord
7 and a business. So we are pretty close to almost
8 the entire piece of the phase one build point.

9 COMM. CANTOR: But at the end of
10 the day, if everyone stonewalled, okay, are there
11 a hundred businesses that are exposed to eminent
12 domain?

13 MR. GOLDRICH: No. The eminent
14 domain only is -- would involve properties that we
15 do not own. So we have engaged in negotiations
16 and successful acquisition without eminent domain
17 for a little more than 95 percent of the property.
18 The remaining businesses, EDC is engaged with
19 them, and it is the hope of the City that we can
20 come to an agreement and not have to use eminent
21 domain.

22 COMM. CANTOR: But how many
23 businesses does that incorporate?

24 MR. GOLDRICH: Oh, the remaining,
25 I'm not sure exactly. I think I'll leave that to

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

14

2 David Quart to answer that exact number.

3 COMM. CANTOR: But it's not the
4 100.

5 MR. GOLDRICH: No. Those are --
6 there are just a couple of properties that are
7 left, so it's a very small piece.

8 COMM. CANTOR: Thank you.

9 THE CHAIR: Michelle.

10 COMM. DE LA UZ: Since you touched
11 on the tax revenue piece of it, do you happen to
12 know the breakdown in terms of tax revenue that's
13 generated from the Willets West versus Willets
14 East?

15 MR. GOLDRICH: No, I don't.
16 Subsequent speakers may have that, but I don't
17 have the split between the two.

18 COMM. DE LA UZ: Thank you.

19 THE CHAIR: Any other questions for
20 Rob Goldrich?

21 (No response)

22 THE CHAIR: Rob, thanks for coming,
23 nice to see you.

24 MR. GOLDRICH: Thank you, nice to
25 see you.

THE CHAIR: David Quart is our next speaker.

MR. QUART: Good morning, Chair Burden, good morning, Commissioners. My name is David Quart, and I'm a senior vice president with the New York State Economic Development Corporation. I'm very pleased to be a co-applicant for the Willets Points development project.

As you know, the Willets Point plan created by EDC, in close collaboration with the community, the Department of City Planning, and other key agencies as well as area elected officials, was adopted in November 2008. The actions before you today will allow this most important project to move forward to clean up and transform the Willets Point district into the vibrant mixed-use community in addition to that plan, creating a whole new neighborhood in Queens. I want to take this opportunity to discuss the progress the City has made on several fronts since the 2008 approvals to help show what Rob talked about.

1
2 infrastructure work a couple of years ago to
3 support the future development. This work is
4 along 126th Street and other adjacent areas near
5 the district, and that work will be substantially
6 complete at the end of this year. We worked to
7 acquire properties in the phase one area. As Rob
8 stated, we currently own or are in contract to
9 purchase about 95 percent of the area phase one.
10 And we are continuing to negotiate with the
11 existing property owner, and I'll have to talk
12 about that some more.

13 The first full phase of the
14 project also requires construction of new ramps at
15 the Van Wyck Expressway to enable better access to
16 the area. The City has taken significant steps to
17 progress the ramps. Receiving key approval from
18 the Federal High Administration last year was a
19 major milestone, and it has committed to fund the
20 ramps to ensure the project is fully realized.

21 The City also established the
22 Willets Point Workers Assistance Program to
23 provide a variety of services to workers in the
24 district. To date over 600 workers are
25 registered, with about 470 taking advantages of

24
25

the vocational skill training, ESL, computer classes and other programs.

The relocation of existing businesses at Willets Point has always been part of the project plan. The City, as Rob mentioned also, has brought on relocation experts with Cornerstone Crew, and they are working intensely with businesses free of charge to understand their space needs, identify relocation sites, and help make offers on their behalf, and their work is ongoing and will continue.

We now have a clear path forward to achieve the development envisioned under the '08 approvals. The proposal for the initial 23 acres fulfills the first phase of the original vision for the area and more, as the development team will attest. Through the RFP process that we initiated in 2011, the City learned some very important lessons, that the transformation of Willets Point is not possible all at the same time. None of the proposals we initially received offered development that could feasibly realize the goals of the plan. The developer proposal -- the developer's proposal in its final form

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

18

2 conformed fully with the vision, addressing two
3 key challenges. The absence of development
4 activity in the general area surrounding Willets
5 Point, and the need to remediate environmental
6 contamination on a large portion of the district.

7 Cleaning up the site, a critical
8 public purpose underlining the entire project, and
9 establishing economic activity to support the full
10 vision must happen first. The actions before the
11 Commission today would allow for initial uses that
12 are critical to create the economic environment
13 necessary to achieve the full vision at Willets
14 Point.

15 (Bell rung)

16 MR. QUART: Thank you.

17 (Laughter)

18 MR. QUART: I'm happy to take any
19 questions.

20 THE CHAIR: Thanks, David, nice to
21 see you.

22 MR. QUART: You too.

23 THE CHAIR: Questions from the
24 Commission. Irwin?

25 COMM. CANTOR: Your timing is

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

19

2 perfect.

3 Question. Why do we have a wait
4 of almost ten years before we reach the housing
5 component?

6 MR. QUART: Good question. So a
7 couple things I'll say on that. First, and I'll
8 just mention, you know, I think while we certainly
9 would all -- we all want to see this project
10 happen as quickly as possible, but what we have
11 learned through the RFP process is that it really
12 needs to happen in phases. And it's a -- this is
13 a, as you all know, major transformation of an
14 area which currently really has no -- no there
15 there. There are many businesses there, and
16 obviously we are working with them, but there is
17 no there there in terms of a neighborhood. And so
18 cleaning up the site initially and then creating
19 those -- creating an economic engine to establish
20 this environment is really key first. And that
21 will take -- that will take several years. And
22 until that happens, it will -- there's no way to
23 really bring the housing on. So I think that's
24 why there's some time for it.

25 In addition, as I mentioned because

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 it's come up, the ramps as well must be built in
3 order to achieve the full phase one of the
4 project. And, you know, we're making a lot of
5 progress on that. The City is committed to
6 funding it. But that also is a multi-year process
7 for, as I'm sure you know or can imagine, an
8 incredibly complicated piece of infrastructure
9 that will require multiple years of designs and
10 approvals ultimately. But the key is really what
11 I've said initially, which is creating that
12 economic environment and establishing it, and to
13 have seen that initial transformation take place
14 really has to happen before the other uses,
15 including the housing, which we know is so
16 critical to the Queens community, can be built.

17 COMM. CANTOR: Okay. But to
18 follow up, the remediation of course is obvious.
19 The number of years that it takes to do the
20 remediation is also pretty obvious. And the
21 landfill is pretty obvious. But why cannot -- it
22 seems to me, if you put that aside for a moment,
23 that you've described a critical path, if you
24 will, of the ramps system. Why cannot that be
25 accelerated?

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

21

2 MR. QUART: I think right now, you
3 know, as we think about -- I don't have the full
4 schedule in front of me -- as we think about
5 various steps that need to take place, it will
6 take many years in order for us to actually start
7 the construction of the ramps. And so at this
8 point our best estimate is that we would begin
9 construction of the ramps in 2021 and complete
10 construction of the ramps in 2024, after which the
11 full development can progress.

12 COMM. CANTOR: Could you fill me in
13 on why that should take, quote, many years to
14 start the construction of the ramps?

15 MR. QUART: I mean I think you can
16 certainly -- I guess certain pieces of the
17 milestone -- I mean, for example, the approval
18 that we achieved last year from the Federal
19 Highway Administration, which was a major
20 approval, the access modification report, that was
21 two years of incredible amounts of efforts and
22 resources to get that initial approval. And
23 that's really the key initial approval to allow
24 the project to move forward. And that was two
25 years in and of itself. There are a series of

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 steps that we need to take with local, state and
3 federal authorities in order to ultimately improve
4 the design of the ramp. Where the footings are
5 going to land and doing all the site investigation
6 of that. All the coordination we'll need to do
7 with DEC and DEP and the Federal Highway
8 Administration going forward. You know, just
9 submitting our specs and estimates of the project
10 as we move along. So each of those things takes a
11 significant amount of work, a significant amount
12 of time.

13 COMM. CANTOR: Are they
14 sequential, as opposed to the opportunity to be in
15 parallel?

16 MR. QUART: The ramp design and sort
17 of testing and approval schedule is largely
18 sequential, yes.

19 COMM. CANTOR: Thank you.

20 MR. QUART: Okay, thank you.

21 THE CHAIR: Other questions for
22 David Quart? I'm sorry, Michelle.

23 COMM. DE LA UZ: I thank you for
24 being here.

25 You stated -- obviously one of the

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 significant goals of the project is to clean up
3 the site. And I'm just wondering if you could
4 provide more detail -- although maybe I should
5 turn to my right -- to provide more detail about
6 the cleanup. I'm assuming that it's under New
7 York State DEC and that it's under the voluntary
8 cleanup program, and I'm wondering if it's
9 anticipated that the development will qualify for
10 brownfield tax credits, assuming that they still
11 exist at the time that this project moves forward.

12 MR. QUART: Yes. Yes, I believe
13 that's all accurate and that the plan is that the
14 developer will be applying for the brownfield
15 program. I think after me a couple of
16 representatives from the development team will
17 speak, and they can speak more specifically to
18 that, but that's accurate.

19 THE CHAIR: Yes, Anna.

20 COMM. LEVIN: And on the
21 environmental cleanup, is the City imposing any
22 kind of timetable on the developer for completing
23 or milestones for completing the cleanup? And
24 also, is the City contributing financially to the
25 cost of the cleanup.

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1
2 MR. QUART: Yes, thank you,
3 Commissioner Levin. The City, to your first
4 question, the City's agreement with the developer
5 requires that they begin commencement of the
6 cleanup as soon as the property is conveyed. So
7 as soon as what we hope is a ULURP approval, and
8 after what we need to do in order to close on the
9 properties, the cleanup would begin as quickly as
10 possible after that. The anticipated timeline for
11 the cleanup is approximately two years. And I
12 think everyone is motivated to get that done
13 quickly because nothing else is going to happen on
14 the site until the remediation is done. That has
15 to happen first.

16 In terms of funding, there is a
17 funding agreement that the City has with the
18 developer, and a portion of that funding will go
19 to or can go to fund the remediation of the site.

20 COMM. LEVIN: So are you able to
21 say, roughly speaking, of the total cost of the
22 cleanup how much of it will be paid for by the
23 developer and how much by the public sector?

24 MR. QUART: I mean it's hard to know
25 exactly because a lot more investigation work

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

25

2 needs to be done, which the development team will
3 be doing. So it's certainly possible that the
4 City's funding will cover the cost of the
5 remediation. But I think we need to sort of see
6 how far -- I mean we need to have more information
7 I think from the investigation to know.

8 COMM. LEVIN: So who then bears
9 the risk of those investigations turning up really
10 scary stuff?

11 MR. QUART: The developer.

12 COMM. LEVIN: That's the
13 developer's undertaking.

14 MR. QUART: Right.

15 COMM. LEVIN: So the public
16 commitment is fixed?

17 MR. QUART: Yes, that's right.

18 THE CHAIR: Any other questions for
19 David?

20 (No response)

21 THE CHAIR: Thank you, David. Nice
22 to see you.

23 MR. QUART: Thank you, you too.
24 Thank you very much, commissioners.

25 THE CHAIR: The next speaker is

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

2 Richard Browne, and then Jesse Masyr.

3

MR. BROWNE: Good afternoon,
4 Madam Chair, Commissioners, ladies and gentlemen.
5 Thank you for your time today. My name is Richard
6 Browne. I'm a partner at Sterling Equities and a
7 principal in the entity QDG, which is a joint
8 venture between Sterling Equities and the Related
9 companies, and the designated developer for
10 Willets Point.

11

I'm joined today by my colleagues,
12 Jean Vanderberg from Related, as well as our land
13 use counsel, Stroock, Stroock & Lavan, Rothschild,
14 Jesse Masyr, and he just moved firms to Fox
15 Rothschild. We're joined by our other consultants
16 on traffic, and our environmental impact from AKRF
17 and VHB. So if you have follow up questions that
18 I can't answer, I've got some folks here that can
19 help clarify.

20

Rather than be redundant and
21 restate all the reasons why, you know, the time is
22 long since past to revitalize Willets Point and
23 this community, I thought I would take a few
24 moments and explain the genesis and thinking
25 behind our ideas, and why I think our plan is

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 certainly by far the most viable of any that came
3 across the City's desk and came across our minds
4 as we were trying to find the best way to
5 revitalize the area but still preserve the
6 original plan that was approved here in 2008.
7 And, as you correctly mentioned earlier, while
8 your function is just to approve the interim use
9 part on Willets Point, obviously there are many
10 questions that are needed to be asked and answered
11 and that we actually have been asked and answered
12 over the last nine months as we have gone through
13 our process. And those being why are you building
14 a retail facility, why aren't you building it in
15 Willets Point, and where is the housing, you know,
16 why are we waiting yet longer for our vision to be
17 executed. So let me take those quickly one at a
18 time, and then I welcome your follow up questions.

19 It's been stated here, and I
20 don't really need to reiterate, the economic
21 climate that this project was born in was quite a
22 difficult one, resulting in instead of a 61 acre
23 transformation it became a rolling -- a rolling
24 transformation. So the first 23 acres is being
25 transferred to private ownership and to be cleaned

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 up. And obviously that is in and of itself is a
3 gargantuan effort. I'll be able to talk more if
4 you like about the brownfield program and what our
5 contemplated protocol is at this point, what we
6 know and what we don't know at this point.

7 (Bell rung)

8 MR. BROWNE: Sorry, I rambled.

9 THE CHAIR: No, you posed some very
10 good questions.

11 MR. BROWNE: Okay.

12 The CHAIR: You were beginning with
13 the first one, with housing, et cetera, so why
14 don't you continue.

15 MR. BROWNE: Okay.

16 THE CHAIR: Because I know those
17 questions, even though we're looking at this side,
18 each of those questions are pertinent.

19 MR. BROWNE: Shall do, okay.

20 So why aren't -- why are we
21 building -- why are we leading with a retail
22 facility. And that's been answered here. In
23 order to make any of this project viable at this
24 point, we do need to create an income stream that
25 we feel is most reliable and is something that we

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 as a group know very well. And I should add the
3 reason why Sterling brought in Related -- as you
4 know, Sterling is an affiliate of the New York
5 Mets. Why Sterling brought in Related was for
6 several reasons. Number one, they're a resource
7 in depth and integrity as one of the first class
8 developers in this country. But number two, their
9 retail experience and depth. Number three, their
10 commitment and track record to affordable housing.
11 They have developed over 45,000 affordable housing
12 units over the last 40 years. They own and
13 continue to own and operate affordable housing in
14 all five boroughs of the City. And we remain
15 fully committed to the original vision that was
16 approved here in 2008. We are not interested in
17 seeing a parking lot across the street from our
18 main entrance on 126th, and we put a team together
19 in order to execute that vision.

20 So the retail facility, of all
21 the things that we could come up with, and we
22 actually had a proposal that was leading with a
23 convention center as another alternative, the
24 retail facility we believe is by far the most
25 economically viable engine that could help support

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 the development at Willets Point. One statistic
3 that rings true in my mind is that Queens, the
4 borough of Queens residents, they spend over five
5 billion dollars a year on retail shopping outside
6 of Queens. They go to Roosevelt Field, they go to
7 Woodbury Commons. And while we all think there's
8 enough retail around, the statistics really point
9 otherwise. Queens is actually underserved by good
10 quality retail. And so we really believe in this
11 project as a means to an end.

12 Why did we do it in Willets
13 Point, why are we putting it in the middle of our
14 parking lot where Shea Stadium was. And I
15 understand the sensitivity that this is mapped
16 parkland, although this is an approved use, just
17 given the designation of it, and I won't get into
18 the semantics of it, but it's analyzed and
19 reanalyzed.

20 When you, number one, first and
21 foremost, putting a retail mall on this 23 acres
22 would shatter the original vision from 2008 and
23 what Willets Point ultimately wants to be. So
24 that's a non starter certainly from your point of
25 view. I can tell you from a retailer and business

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 person's point of view, trying to convince the
3 chairman of Macy's or Nordstroms or whoever, you
4 go down the list, to establish a retail facility
5 in 23 acres when it's still surrounded by what
6 it's surrounded by, and you combine that with the
7 lack of access on 126th Street and that corridor,
8 versus right in the middle of the City Field
9 parking lot where we've got 50 acres of
10 undeveloped land that sat as a parking lot, and
11 it's right next to the train, it's just overly
12 compelling as to why it wants to be where we have
13 it located. And inasmuch as our affiliate has a
14 long term lease, with the City's permission we are
15 able to at least offer up this scenario. And it
16 beared (sic) fruit and obviously we are standing
17 here today because the amount of subsidy that we
18 have asked for, which is dedicated for really just
19 to the Willets Point district, is by far the
20 lowest of any other developer because we're able
21 to look at these 100 plus acres wholistically.

22 The housing part I think I've
23 addressed. We are interested in seeing it happen,
24 we are committed to seeing it happen. We need two
25 things to happen. We need an income stream to be

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

32

2 able to support it. And then of course we need
3 the ramps. And we expect both of those to happen.

4 THE CHAIR: Okay, now then I'll
5 take questions.

6 So it's important that you actually
7 pose the questions that's on everybody's mind,
8 even though our purview is --

9 MR. BROWNE: Understood.

10 THE CHAIR: -- on the east side of
11 the line.

12 So are there questions for
13 Mr. Browne on issues that relate to what is before
14 us?

15 COMM. CANTOR: Ladies first.

16 THE CHAIR: Start with Queens or --

17 COMM. CANTOR: No, ladies first.

18 COMM. DE LA UZ: You started to
19 answer the question about the brownfield tax
20 credits.

21 MR. BROWNE: Yeah.

22 COMM. DE LA UZ: So if you don't
23 mind --

24 MR. BROWNE: Sure.

25 COMM. DE LA UZ: Providing that.

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

MR. BROWNE: Okay. We --

COMM. DE LA UZ: Because I think that's part of the potential income stream which might, at least in our mind, my mind, answer some of the questions.

MR. BROWNE: I wish, but not really. Let me explain why.

First of all, just to give you some background, I was the owner's representative for the development of City Field. The Willets west portion of land is not a brownfield site nor will it be. It's regulated, it's a regulated site because it used to be ash fill, but it's not contaminated, it would not qualify as a brownfield site. So there's no application, no credits, no nothing over in Willets west, if you will. Willets Point certainly will qualify. And we do expect just in terms of timeline, we expect to be enrolled in the program prior to closing.

We then have -- I'll address your question on the tax credits first. As you correctly said, there is a chance that we will receive tax credits if the sunset provisions in the plan are extended beyond the dates that are

2 currently contemplated, although those credits are
3 really limited to 25 percent of your cost of
4 remediation. Our budget to build the retail
5 facility is over a billion dollars. So there
6 isn't going to be any -- if it costs, let's just
7 use round numbers, if it costs all hundred million
8 dollars to remediate, and we get \$25 million in
9 tax credits, number one, it's a credit off of the
10 cleanup effort in Willets west, in the Willets
11 Point district. It wouldn't do much to offset a
12 billion dollar income producing retail project
13 across the street.

14 We are enrolling in the program
15 really because of the administrative nightmare
16 involved in trying to clean up 23 acres which has
17 been -- with about 120 different tax lots. We
18 want to work under one permit, one protocol, one
19 governing body, one sign-off, that type of thing.

20 Timeline. As soon as we close, we
21 will be in there doing investigative work of all
22 23 acres, both above grade and below grade. There
23 has been very limited work done at this time,
24 rightly so, because the City has not had
25 possession. We are to be delivered vacant

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 possession. So whenever that happens, day one,
3 day two we go in and we start all of our testing,
4 which is a big effort.

5 We then have to get DOB permit
6 approval to do demolition and above-grade
7 remediation, but then we need to file with DEC to
8 have them approve our work plan and protocol based
9 on what we find. So it's when you get into how
10 long this is all going to take, two years to clean
11 up from when you start, then you build a parking
12 lot, which isn't an overly long exercise, which
13 then enables you to start construction in City
14 Field, because we have to relocate the parking
15 before we can start disturbing the Mets parking
16 lot, you're looking at commencing construction in
17 the mall approximately, you know, two, two and a
18 half, three years after you first take possession.
19 And then it's about a three year build to do the
20 retail facility.

21 So that's why we're -- it's
22 longer than we all want it to be, but it's a
23 massive job, and again, the only way that we could
24 get this ball moving forward instead of leaving it
25 the way it is.

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

COMM. CANTOR: Mr. Browne, perhaps I should have asked this question of Mr. Quart, but with regard to the -- you're doing 23 and you're leaving the other for tomorrow.

MR. BROWNE: The City is, yes.

COMM. CANTOR: Right. Do we know, do you know whether the businesses in the remaining acreage are going to be allowed to stay or are they going to be moved out?

MR. BROWNE: David, are you here, David?

THE CHAIR: Well, David can get back --

MR. BROWNE: Oh. Oh. As far as I know, they are not disturbed by this. Anybody that's outside the 23 acres is staying and doing what they've been doing or whatever they want to do.

COMM. CANTOR: Thank you.

MR. BROWNE: Yeah.

THE CHAIR: Okay. Any other questions for Mr. Browne?

(No response)

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

THE CHAIR: Thanks very much.

MR. BROWNE: Thanks for your time.

THE CHAIR: We're actually going to -- Jesse, we are going to switch to speakers in opposition now, we are running out of time. So we'll see you in a little while.

So speakers in opposition, beginning with Ben Haber. Then Joseph Ardizzone. Ardizzone. Ardizzone. And then Edwin Westley, and then Sunny Hoffman.

MR. HABER: Madam chairman, members of the Commission. My name is Ben Haber.

The Willets Point plan approved by this Commission in 2008 was clear and unambiguous. The City would acquire 62 acres of Willets Point either through voluntary sale by property owners or, if need be, through eminent domain. A real estate developer will be selected based upon input from the community, and the one selected would then construct on the site upscale retail stores, office buildings, a convention center, a school and luxury housing with a small portion set aside for affordable housing. The developer will be required to remove whatever contamination existed

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

2 on the 23 acre area.

3

4 There was no mention, I repeat,
5 no mention of a 1.4 million square foot shopping
6 mall at City Field or any connection to City
7 Field.

8

9 There was no mention the City will
10 pay tens of millions of taxpayer dollars to
11 acquire the property -- and may well spend more
12 millions -- to sell the property to the developer
13 for one dollar. That's right, one dollar.

14

15 There was no mention the City would
16 subsidize the development to the tune of \$99
17 million. There was no mention that a fix was in,
18 that the Mets and their Related Companies would be
19 selected so to seek a huge shopping mall. Hence,
20 the reason the community was shut out of the
21 developer selection process.

22

23 There was no mention that a shopping
24 mall would be given priority over Willets Point,
25 and that the housing is placed on the backburner
until 2025, if indeed ever built.

26

27 And Mr. Cantor, the only area in the
28 area that can be used is the highways. They
29 cannot be enlarged. There's never going to be

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 ramps. The housing building is never going to
3 happen.

4 There was no mention Fred Wilpon,
5 a multimillionaire, needs the shopping mall to
6 earn money to complete the approved 2008 Willets
7 Point plan.

8 There was no mention that without a
9 mall, Willets Point would never be completed.
10 Absolute nonsense. Other developers would be
11 happy to get the land for one dollar and receive
12 \$99 million to boot and the job without a mall.

13 The claim that all the application
14 seeks is a minor change to the 2008 plan to
15 construct a parking area in Willets Point and that
16 it has nothing to do with the 1.4 million square
17 foot shopping mall in City Field is nonsense. If
18 it looks like a duck, walks like a duck and quacks
19 like a duck, it is a duck. To claim this
20 application has nothing to do with the shopping
21 mall is a hoax.

22 If there's something it has nothing
23 to do with, it's the 2008 Willets Point plan. Has
24 anybody explained to you what has changed from the
25 plan that you approved? Nothing has changed.

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

40

2 They're just injecting a mall. That's ridiculous.

3 Keep in mind, Community Board 7

4 and 3 considered this item. Community Board 7

5 approved it, 22 to 18. Board 3 rejected it, 30 to

6 one, overwhelmingly.

7 If you allow the applicant to get

8 away with a mall without a ULURP, which is what's

9 happening here, you will be making a mockery of

10 the ULURP process, which was instituted to ensure

11 transparency in government. They should get up

12 and tell you it's really the mall they're talking

13 about.

14 (Bell rung)

15 MR. HABER: It has nothing at all to

16 do with Willets Point.

17 Now, I'm not against big business,

18 nor should you be. I'm against shady business,

19 under the table backroom political deals that make

20 a mockery of ULURP. You should send the word out

21 the City Planning Commission takes seriously not

22 just the word of the law but the spirit of the

23 law, that you will not permit an applicant to come

24 here and blindside you with a phony claim of a

25 minor change for a parking area when in fact it

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

2 seeks the mall.

3

4 Now, I sent to each of you a
5 complete statement about this. And also it
6 appeared in the Queens Chronicle, and I'm leaving
7 it with each of you again.

7

8 THE CHAIR: Okay, so leave it with
9 the secretary.

9

10 MR. BROWNE: If you have any
11 questions, I'll be glad to answer them.

11

12 THE CHAIR: Let me find out.

12

13 Are there questions from the
14 Commission for Mr. Haber?

14

15 (No response)

15

16 THE CHAIR: There are not. But we
17 do thank you for your testimony.

17

18 Joseph Ardizzone. And then Edwin
19 Westley.

19

20 MR. ARDIZZONE: Hi. My name is
21 Joseph Ardizzone. I was born and raised on
22 Willets Point. I am now 81 years of age. And I
23 wish to let's you all know that what's been
24 presented to you is not really so.

24

25 I was born and raised in that area,
and I'm proud to be in that area, for now and for

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

42

2 always. Right now this bargain is robbing me of
3 my past, my present and my future. I wish you
4 would take note of that. And also, what they say
5 to you is not so.

6 Thank you.

7 THE CHAIR: Thank you for coming.

8 Edwin Westley.

9 MR. ARDIZZONE: Did you want to ask
10 me some questions?

11 THE CHAIR: Are there questions?

12 (No response)

13 THE CHAIR: No, there were no
14 questions.

15 MR. ARDIZZONE: No questions,
16 thanks.

17 THE CHAIR: Edwin Westley, and then
18 Sunny Hahn.

19 MR. WESTLEY: Thank you, Madam Chair
20 and Commissioners, for giving me this opportunity
21 to talk to you. My name is Ed Westley. I am
22 president of the Jackson Heights Beautification
23 Group, and also a member of Community Board 3.

24 The Queens development group plan is
25 to clear the Willets Point junkyards from the site

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 line of City Field with a parking lot and a hotel
3 built on the Special Willets Point District. That
4 was approved in 2008. There would be very little
5 discussion if it stopped there. But now, they
6 have moved out of the approved special district
7 and into mapped parkland. They have requested
8 30.7 acres to build a 1.4 million square foot
9 shopping mall.

10 They referred to this land as
11 Willets West. Let's be honest, it's Corona. They
12 would also like us to believe that Willets Point
13 is downtown Flushing. This is like referring to
14 Washington Heights as upstate Manhattan.

15 Community Boards 3 and 7 have held
16 public hearings on the application. The vote at
17 Community Board 3 was 30 against, one for, and one
18 abstention. Community Board 7 voted 22 for and 18
19 against. We request you to break the tie and say
20 no.

21 There are several solid reasons to
22 say no. First, there is no plan to replace the
23 30.7 acres of parkland.

24 Second, the 1961 law referenced in
25 the application as justification for the mega-mall

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1
2 is wishful thinking. The Urban Justice Center has
3 issued an opinion that there is nothing in the law
4 that even hints of the building of a mall. It
5 does address possible development, but only as it
6 relates to a sports venue.

7 Third, the demolition of the
8 Empire Millwork Corporation building, which is on
9 the State and National Registers of Historic
10 Places.

11 Four, the traffic increase will be
12 beyond the capacities of both highways and side
13 streets.

14 Fifth, transit and pedestrians. The
15 number 7 train will need to be now a double decker
16 train to handle the volume of people.

17 Promises are made but not kept.
18 Affordable housing was a key element in voting for
19 the 2008 application. It was the number one
20 priority. Now, phase two, with the promise of 35
21 percent for affordable housing, has been -- has a
22 scheduled completion for 2032.

23 The Economic Development
24 Corporation, the sponsoring agency, they are
25 responsible for two contrary statements in the

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

2 body of the application.

3

4 One, capture retail spending
5 currently lost to surrounding suburbs. But then
6 they go on to say it would not raise retail
7 capture rates within a five mile primary trade
8 area. If the second statement is correct, then
9 they will put existing Queens malls into
10 bankruptcy, like Atlas Mall in Middle Village.

10

(Bell rung)

11

12 THE CHAIR: Do you have a concluding
13 sentence? It's okay.

13

MR. WESTLEY: Yes, I do.

14

15 The estimated cost is \$3 billion for
16 phase one A and B. But they have an out clause
17 that cost \$35 million. These developers are
18 kicking the can down the road. This housing is
19 never going to be built.

19

Thank you.

20

21 THE CHAIR: Okay. Thank you. Let
22 me see if there are questions for you.

22

(No response)

23

24 THE CHAIR: No, there are not.

THE CHAIR: Sunny Hahn. Is Sunny
Hahn here?

(No response)

THE CHAIR: Irene Presti. And then
after Ms. Presti, Joanne Marie and Gerald
Antonacci.

Are you Ms. Presti?

MS. PRESTI: Yes.

THE CHAIR: Come on up.

MS. PRESTI: I thought I was farther
down on the list.

Thank you, Madam Chair and
Commissioners. My name is Irene Presti, and I own
property at Willets Point, and I'm here to voice
my strenuous opposition to this toxic development
deal that the City has proposed for Willets Point.

This all began seven years ago, when
the City decided that I am not a good enough
person to own my own property and that they had
what they called a higher and better use for it.
To put this simply, they wanted to take my
property, violate my constitutional rights, and
hand it over to a well-connected developer.

This was a deal, however, that

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 generated a great deal of controversy down at the
3 City Council, the legislative body that needed to
4 approve the project. Most of the time the use of
5 condemnation is seen as a drastic act and is used
6 sparingly, and only for a tangible public use.
7 Not seeing any great public use in the City's
8 proposal, the City Council balked, sending EDC
9 scrambling.

10 Here's where the dealmaking began
11 and various interests came into the negotiations,
12 and thousands of units of public housing, along
13 with an agreement to provide a so-called living
14 wage to retail workers was added to give this land
15 grab a public flavor. I remember an old saying,
16 that if you're going to bake a lie, you need to
17 frost it with the truth. And so it went, with the
18 land grab being frosted with the adding on of
19 these perceived public interests.

20 Fast forward to today. Gone is the
21 housing, pushed way back into the distant future
22 with no guarantee that it will ever get built.
23 Gone also is the pledge to provide the workers
24 with a living wage. The only thing that is left
25 is something that was never there in the first

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 place, a massive traffic generating nightmare of a
3 retail mall that was never part of the original
4 deal. And would never have passed the smell test
5 with council members concerned with the use of
6 eminent domain to take away property from small
7 owners like myself.

8 The City has rejected a request
9 from our legal counsel to look at the project
10 without eminent domain. This is a classic bait
11 and switch, one that will cause considerable harm
12 to all of the neighborhoods surrounding Willets
13 Point. Because you see, when the City put forward
14 its original plan, it said that it would provide
15 ramps off of the Van Wyck to mitigate the tens of
16 thousands of weekly car and truck trips. Now,
17 even with an added 1.4 million square feet of
18 mall, there are no immediate plans to build those
19 ramps. Just like the housing, they are relegated
20 to an uncertain future. And without them, heaven
21 help those trying to navigate streets like
22 Roosevelt Avenue, near where my property lies
23 today. The City still refuses to disclose
24 anything about the cost of the Van Wyck ramps,
25 though they have agreed to pay for them.

This unneeded, unnecessary mall will
be built on the site of the current City Field
parking lot.

(Bell rung)

MS. PRESTI: So where will the Mets
fans park?

May I finish?

THE CHAIR: If you can just do a
short, conclude --

MS. PRESTI: Sure, I'll do it fast.

They will park on the land that the
City has purchased from Willets Point property
owners for \$200 million. So the City used the
threat of eminent domain to grab land that will
now be used for a parking lot.

Back when the mayor extolled the
virtues of this deal, he called Willets Point the
City's first green neighborhood. Not in our
lifetime. What the City is getting for its
overall investment of around \$500 million is a
mall and a parking lot. Everything else is simply
smoke and mirrors, with no guarantees whatsoever.
Making all of this so much worse is that the City
administration told the City Council that it would

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

recoup its investment when the selected developer was chosen. And instead, the City has decided to gift the property to Related and Sterling Equities for one dollar.

THE CHAIR: Okay, that's --

MS. PRESTI: When the City came for my property and the rest of the land owned by small owners like me --

THE CHAIR: You have to conclude.

MS. PRESTI: They claimed it was for the purpose of cleaning up Willets Point, alleging that it was essentially a toxic waste dump.

THE CHAIR: All right.

MS. PRESTI: I have hired with my own money a chemist with great credentials. And he came to me through an angel I guess, to test my property, because I don't believe that the toxicity is what they say.

And I'd just like to say one thing, please, for both the citizens of New York and the property owners of Willets Point, please do the right thing. Don't be a rubber stamp for the mayor. Say no to Willets Point West.

THE CHAIR: Don't go away. Let me

1

51

2 see if there are any questions for you. Anna.

3 COMM. LEVIN: Yes. Mrs. Presti,
4 I'm sure this is an alternate universe for you,
5 but are you able to locate your property roughly
6 on that plan so we know where your property is?

7 MS. PRESTI: I'm not in the new --
8 this phase one.

9 COMM. LEVIN: Okay.

10 MS. PRESTI: I'm outside of it. But
11 I'm just been notified by different legal people
12 that mine is coming up for eminent domain. So
13 they've already started to let us hear that we are
14 going to take your property away from you. And my
15 tenants have been harassed.

16 THE CHAIR: Other questions for
17 Ms. Presti? Michelle.

18 COMM. DE LA UZ: Ms. Presti, are you
19 connected to other property owners, how many other
20 property owners are you aware of that are in
21 similar circumstances as you?

22 MS. PRESTI: Oh, everybody in this
23 section that's not in the phase -- the first where
24 they're trying to develop now.

25 THE CHAIR: Joe.

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

2

3

COMM. DOUEK: Just can you give us
what's the nature of your property?

4

5

MS. PRESTI: I took the property
over when my husband passed away.

6

7

COMM. DOUEK: What kind of property
is it?

8

9

MS. PRESTI: And it's now rental for
auto businesses.

10

COMM. DOUEK: Auto repair?

11

MS. PRESTI: Yes.

12

COMM. DOUEK: Thank you.

13

THE CHAIR: Irwin.

14

15

16

17

18

19

20

21

22

23

COMM. CANTOR: You heard earlier
testimony to the fact that the 2008 plan didn't
attract any enthusiasm from the construction
community, the development community, and as a
result they came back and asked for alternate
proposals, and apparently this is the best
alternate proposal they have. If you accept the
premise of redevelopment of the area, what would
you suggest be done, considering that there has
been no interest in the original plan?

24

25

MS. PRESTI: I think there was
interest. It was all just wiped away by the

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

53

2 parties that are interested here. There are three
3 or four other developers that have very good
4 plans. They don't call for eminent domain, they
5 don't have to go through any of this. And they
6 had viable plans for economic improvement of the
7 area.

8 And cleanup also is a big thing,
9 really big thing. And I'm so tired of hearing
10 about it because I don't believe -- and I hired a
11 chemist, and unfortunately I don't have enough
12 stuff to be able to -- enough paperwork and
13 information to be able to hand it in now. But I'm
14 hoping to hand something in by the 22nd, which I
15 believe is the written deadline for you -- a place
16 for written material for the Commission to see.

17 COMM. CANTOR: And these three or
18 four developers that you're speaking about never
19 presented to the City?

20 MS. PRESTI: Oh, yeah. Yes, they
21 were.

22 COMM. CANTOR: And they were
23 summarily rejected?

24 MS. PRESTI: Just -- yeah. I don't
25 know what happened to them. I mean the

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

1

2 information is there, all the statistics are
3 there, it's all available. The facts are the
4 facts.

5

COMM. CANTOR: Thank you.

6

THE CHAIR: Joe.

7

COMM. DOUEK: Those developers went
8 through the RFP process?

9

MS. PRESTI: Yeah.

10

COMM. DOUEK: And through EDC?

11

MS. PRESTI: Yes. I don't have all
12 of that information with me but it's all
13 available.

14

COMM. DOUEK: Thank you.

15

THE CHAIR: Thank you so much,
16 Ms. Presti --

17

MS. PRESTI: Thank you.

18

THE CHAIR: -- for coming in.

19

Joran Ree. Joran Ree?

20

(No response)

21

THE CHAIR: Gerald Antonacci, and
22 then Ted Barbieri.

23

MR. ANTONACCI: Hello. I'm Gerald
24 Antonacci. I'm a land owner and a business owner
25 at Willets Point.

The only reason we're here is because of they're putting an application for a parking lot. If it's approved, it's just to build a mall. And that's all this is about, just to get a mall approved.

At a recent session over here on Monday, somebody mentioned that perhaps Sterling and Related needed the profits from the mall to pay for the remediation. That's totally incorrect because they were given a \$99 million grant for cleanup. And they were given \$20 million in sales tax exemptions. Make no mistakes, any profits from that mall go straight to Sterling and Related, and the remediation is paid for by the tax paying people.

This mall is a bad idea for the following reasons. Nobody wanted the mall. Nobody asked for the mall. It's taking away 30 acres of parkland. Even though they say it's not parkland, it's parkland.

It's a traffic nightmare. We've seen on the studies that there's intersections where you have to wait 15 minutes before you can get through the light. Traffic is going to be

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 backed up for miles and miles and miles. The Van
3 Wyck ramps and the highway ramps, they are never
4 getting built. There's a clause in the contract
5 that says if Sterling and Related want to build
6 them, they can build them by themselves. There's
7 also a line in the contract that says under no
8 circumstances is it to be assumed that the City is
9 obligated to build these ramps. They'll come and
10 say they're committed to do it, that's their
11 famous word, they're committed to do it. I'm
12 committed to winning the lottery, but I haven't
13 done so so far. Unless the contract is changed
14 and it's put in stone that it has to be done and
15 it has to be done soon, it's just, you know, we'll
16 hand you one of our famous letters that don't
17 worry, the mayor says he's committed to doing it.

18 Housing. You can forget about
19 housing, housing ain't never getting built.
20 There's too many out clauses, like somebody said
21 before. There's a \$30 million out clause. And if
22 the City doesn't build the ramps, they don't have
23 to build the housing. They don't want to build
24 housing, housing doesn't make money.

25 The cost of this has shifted to the

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 taxpayers. They've gotten 23 acres for one
3 dollar. That's \$250 million dollars in land for
4 one dollar. They've gotten \$100 million grant,
5 \$20 million in sales tax, and it just goes on and
6 on and on. Why don't we just build a mall for
7 them too. I mean, you know.

8 The remediation charade. At
9 Community Board 7, Dr. Savino, the environmental
10 chairman, voted no against this. He voted no for
11 this project. He thought the taking of parkland
12 was more important than the remediation. So that
13 shows you how much a guy that is so remediated
14 oriented thought about remediation, that he
15 thought it was that bad that he voted for the park
16 instead of remediation.

17 And eminent domain. Don't
18 believe for a second if there is a chance to use
19 eminent domain they won't use it. They tried it
20 already. We had to go to court to sue them, and
21 then at the last minute when they awarded it to
22 Sterling and Related, they pulled it back --

23 (Bell rung)

24 MR. ANTONACCI: -- because they
25 couldn't go forward at that time.

THE CHAIR: Let me see if there
are questions for you.

(No response)

THE CHAIR: Okay. Thank you.

Ted Barbieri.

MR. BARBIERI: Thanks for the
opportunity to speak here today. My name is Ted
Barbieri. I'm a senior staff attorney at the
Community Development Project of the Urban Justice
Center. I just have one point to make that I'd
like the Commission to consider today, and that's
the tenant -- commercial tenant relocation plan in
phase one.

We have been involved with the
Sunrise Cooperative, which is an organization of
about 60 auto repair shops that have been doing
business in phase one for many years, in some
cases multiple decades. We have known, the
writing has been on the wall since 2008, we
recognize that. We have approached the EDC, the
developer, and we have worked with Council Member
Ferrerias to get a relocation plan that's
meaningful and workable for the members of the

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

23
24
25

cooperative. Unfortunately, we don't have a viable relocation plan, and that's a serious flaw in this project.

The LaGuardia retraining program unfortunately doesn't work. The workers already have jobs, they're running businesses. All they're asking for is to be relocated somewhere else where they can continue to operate their business.

Cornerstone recently has been helpful in terms of analyzing the market and finding places to relocate to. Unfortunately, the ask is to relocate all the businesses. They benefit from co-location, they're asking to be relocated together, and Cornerstone hasn't been able to help us get to that point.

We came up with an alternate relocation plan. We revised the plan after discussions with EDC. Still we don't have a commitment from the City to help out in relocation. We have approached the developer. Unfortunately, that hasn't resulted in a viable relocation plan either.

We ask the Commission not to support

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

60

2 the project unless there's a meaningful relocation
3 plan for the commercial tenants. Who in this
4 instance really are the most vulnerable citizens
5 of the City because they're being forced to
6 relocate, they have no viable option to relocate,
7 and frankly, most likely they're going to go
8 bankrupt and die because as a result of this
9 project.

10 THE CHAIR: Thank you. Let me
11 see if there are questions for you.

12 MR. BARBIERI: Sure.

13 THE CHAIR: Michelle and then
14 Angela.

15 COMM. DE LA UZ: Hi Ted, thanks for
16 being here.

17 MR. BARBIERI: Sure.

18 COMM. DE LA UZ: Do you have
19 something in writing that outlines what you
20 believe a meaningful and viable relocation plan
21 would look like, because you specifically
22 mentioned that specific elements would be included
23 in that, and that certainly would be helpful to
24 get from your perspective and from the
25 perspective -- and how many different businesses

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

61

2 are you all representing in the cooperative?

3 MR. BARBIERI: It's approximately
4 60 in phase one on the Willets -- in the district.

5 COMM. DE LA UZ: Okay. And it was
6 mentioned earlier, perhaps you can speak to UJC's
7 analysis of the 1961 law, I don't know if that's
8 best addressed by you or someone else, but if
9 there's -- about what might be allowed to be
10 built, that would be helpful information that
11 could be shared with the Commission.

12 MR. BARBIERI: Yeah, sure.

13 To your first point about a viable
14 relocation alternative, it's one that would permit
15 the existing businesses to relocate elsewhere in
16 Queens. We've looked at other properties, we have
17 identified a couple. There is -- we have worked
18 very hard to come -- to meet with consultants to
19 come up with a project that's viable financially
20 obviously. And we think that there's a gap
21 between what we can borrow and provide in terms of
22 debt service. And we've asked for a financial
23 commitment from the City. We've been talking
24 about some numbers but we haven't gotten that
25 commitment. I have it in writing, I can share it

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

62

2 with the Commission.

3 The second point about the
4 statute, the 1961 statute, it doesn't specifically
5 permit the use that's contemplated in --
6 respectfully we would say it doesn't permit the
7 use that the City interpreted -- that this project
8 provides on the Willets West. It doesn't
9 specifically allow a mall to be built there. It
10 talks about promoting trade and commerce, but not
11 specifically permitting this. So respectfully we
12 disagree with the interpretation of the City's
13 lawyers.

14 THE CHAIR: Other questions?
15 Angela?

16 COMM. BATTAGLIA: My question was
17 basically the same.

18 THE CHAIR: You do?

19 COMM. BATTAGLIA: The same question
20 as Michelle's, so we are doing good.

21 THE CHAIR: Any other questions for
22 Mr. Barbieri?

23 (No response)

24 THE CHAIR: Thank you so much for
25 coming.

MR. BARBIERI: Thank you.

THE CHAIR: We will now switch to speakers in favor. And the first will be Jesse Masyr, who will be followed by John Clifford and I then Linh, I think Linh Do. Hi, Jesse.

MR. MASYR: Good afternoon, Madam Chair, members of the Commission, Dr. Kulikowski. My name is Jesse Masyr, and I'm land use counsel for the joint venture.

We are here today before you seeking special permits to the text change to facilitate the transactional uses necessary to implement the 2008 Willets Point plan in phases. As you know, the zoning plan that you passed in 2008 did not foresee a phased development for Willets Point, nor did it foresee that the marketplace would require a major destination to create the economic conditions necessary to facilitate the vision of the 2008 plan. However, the joint venture has determined that to create this initial destination retail as an economic generator, it needs to recharacterize the area before the Willets Point development can occur. Combined with the fact that the Willets Point district cannot be fully

1

2 developed until the Van Wyck ramps are built has
3 led to the placement of the interim parking on the
4 Willets Point site. So, therefore, what we are
5 seeking today is a special permit for what was not
6 anticipated and could not be anticipated in 2008,
7 namely, to allow parking and interim recreation to
8 occur on the Willets Point property.

9

Once we have remediated and
10 cleaned the lot, development will then be
11 facilitated. The first development,
12 interestingly, will be actually in the Willets
13 Point district itself. We will be constructing as
14 part of the initial phase of this project a hotel
15 and retail along 126th Street as part of our need
16 to recharacterize this area. This is a very harsh
17 edge of the City which needs to be changed in both
18 perception and in its economic reality.

19

The Draft Supplemental EIS
20 identifies no categories of significant impacts
21 beyond those identified in the 2008. And I think
22 it's also important to point out to you that in
23 doing this new Supplemental Environmental Impact
24 Statement, we were able to reduce the number of
25 unmitigated traffic impacts in the 2008 report by

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 65 percent. And local intersections have been
3 reduced by 75 percent. And highway times and
4 ramps, the overwhelming number of locations have
5 not had substantial reductions in speed as a
6 result of this project. And we have done this at
7 our own expense. We will be funding the major
8 capital improvement necessary to do the mitigation
9 that was not identified in the 2008 approval. I
10 think that is among the reasons that we were able
11 to get both the support of the Borough President
12 and Community Board 7, because we will have the
13 first real viable opportunity and roadway to clean
14 up what has been a hundred years of contamination
15 in one of the most densely populated areas of our
16 City.

17 We have our other experts here to
18 continue, but if there are any questions I would
19 be glad to answer.

20 THE CHAIR: So what would be the
21 earliest time that the new interim recreation
22 areas could be provided, two years of cleanup and
23 then the interim uses would be -- how long would
24 it -- what's the time frame?

25 MR. MASYSR: Once the cleanup -- once

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

the cleanup --

THE CHAIR: I know you don't have
a long timeline, but --

MR. MASYSR: We lose it sometimes,
that's correct.

Once -- we believe it's reasonable
to estimate that the cleanup will take two years.
Part of it is a bit of a leap of faith on our part
because we don't know exactly what the text in
front of us is and what DEC and the various
regulatory agencies will require from us in terms
of how we will clean up and the methodologies.
But based on our past experience, we believe two
years is reasonable. Immediately thereafter, we
will be able to have reclaimed the property, and
the interim recreation will become immediately
available at that point. So if you think of the
two years, we would say two years and three months
for the interim recreation to be available.

THE CHAIR: Other questions for
Jesse Masysr?

(No response)

THE CHAIR: All right, thanks,
Jesse.

MR. CLIFFORD: Hi. Good afternoon
everyone. My name is John Clifford, Perkins
Eastman Architects. We are working on both the
buildings in phase 1A as well as the retail and
entertainment complex on the west side of City
Field. And I am here just to talk a little bit
about the resiliency efforts that we're
investigating for both sides, as well as the
sustainable initiatives that the project will
undertake.

You probably all know that both
sides of City Field as well as City Field are in
the flood zone. Ironically, this area did not
flood during Sandy. It did not get any of the
devastating floods that some of the other areas of
the city did receive. Nonetheless, we are still
planning to make sure that this area remains
resilient during future storm events and rising
sea levels. And that way, all buildings will be
raised at least one foot above the newly mapped
flood zones. As you know, FEMA came out with some
new flood maps for New York City. The building

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 finished floors will all be one foot above, both
3 for the retail entertainment complex as well as
4 the buildings in phase 1A.

5 For the first part of phase 1A,
6 when the Mets interim parking is constructed, that
7 area will be below the flood plain and would flood
8 if we had a historic flood event. However, any
9 subsequent buildings or streets that are built as
10 phase one is built out will be built above the
11 flood plain.

12 At the ends of the district and
13 along the edge of the retail entertainment complex
14 where the streets are going to remain in the flood
15 plain, primarily 126th Street and Roosevelt
16 Avenue, there's a series of transitional
17 sidewalks, almost a dual sidewalk that was
18 proposed and adopted as part of the Willets Point
19 Special District. And the design guidelines have
20 public amenity areas on the higher area, a public
21 pedestrian sidewalk along the street right-of-way,
22 and then a series of ramps and stairs to make up
23 the grade difference.

24 All life safety and critical
25 support systems will be above -- built above the

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

69

2 flood plain elevation for all of the buildings.
3 Or they will be -- where they can't be where they
4 come out of the ground, they will be in
5 flood-proof enclosures.

6 In terms of sustainability, all
7 of the development on both sides of City Field,
8 whether it's in phase 1A or the retail and
9 entertainment complex, will be built to a minimum
10 of LEED Silver Certification standards.

11 THE CHAIR: It's my understanding
12 that the state has passed a law that all
13 development needs to be built -- allow for two
14 foot free board above the flood elevation. And
15 that therefore the Department of Buildings here in
16 the City is requiring two feet above flood
17 elevation.

18 MR. CLIFFORD: That I'm not a
19 hundred percent sure of. But gratuitously the new
20 maps for the area actually lowered the flood
21 elevation from what was previously there.

22 THE CHAIR: So we'll check to make
23 sure. I mean I know from --

24 MR. CLIFFORD: Right.

25 THE CHAIR: -- the plans that we all

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

70

2 worked with is that you have elevated everything,
3 so it was -- but I wanted to make sure that it
4 allows for it.

5 MR. CLIFFORD: We'll definitely
6 ensure that. Just for information, the average
7 amount of fill that we have to place here is
8 between three and four feet across both sites.

9 THE CHAIR: Yeah, I know you're
10 elevating everything.

11 MR. CLIFFORD: Right.

12 THE CHAIR: Just need to clarify
13 that.

14 Are there questions for John
15 Clifford? Yes, Anna.

16 COMM. LEVIN: Yes. This is a
17 complete non sequitur, but you mentioned you're
18 working on the shopping mall as well?

19 MR. CLIFFORD: We are working on the
20 retail complex as well.

21 COMM. LEVIN: So everyone calls it a
22 retail complex or a shopping mall, but I notice
23 here it's also an entertainment and retail
24 development. What kind of entertainment uses are
25 you designing in there?

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

15

16

17

18

19

20

21

22

23

24

25

MR. CLIFFORD: The uses that are proposed are things like a cinema, bowling alley, maybe a music venue, that kind of thing, restaurants.

COMM. LEVIN: Music venue like a concert facility?

MR. CLIFFORD: Like a restaurant that might have live music. Not necessarily a Madison Square Garden kind of concert halls, yes.

COMM. LEVIN: Thank you.

THE CHAIR: Any other questions for Mr. Clifford?

(No response)

THE CHAIR: Okay. Thanks so much.

MR. CLIFFORD: Thank you.

THE CHAIR: Linh Do and then Babu Veeregowda.

MS. DO: Good afternoon, Commissioners. I'm Linh Do, back here again, senior vice president at AKRF. And Babu and I had, our firms had helped prepare the Supplemental EIS draft. And we are just here to answer any questions the Commissioners may have.

THE CHAIR: Okay. Any questions for

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

2 Linh Do?

3

(No response)

4

5 THE CHAIR: All righty, thanks again

6

for being here.
Babu Veeregowda.

7

8 MR. VEEREGOWDA: Good afternoon,
9 Madam Chair Burden. My name is Babu Veeregowda.
10 I'm a traffic engineer at VHB. I was the one who
11 was responsible for all the traffic study data
12 collection and analysis, both with the draft
13 supplemental EIS and the data that was an aid in
14 completing the final EIS. If there's any, you
15 know, questions or anything about the traffic
16 impacts, I'll be more than happy to answer.

17

THE CHAIR: Questions from the
Commission? Yes, Michelle.

18

COMM. DE LA UZ: Obviously the issue
19 of traffic impacts has been brought up
20 substantially. Did you do -- can you maybe do a
21 compare and contrast on the traffic impacts with
22 and without the Willets West component?

23

MR. VEEREGOWDA: No, we did not
24 include that, we didn't look at Willets West.

25

COMM. DE LA UZ: So you included --

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

2 you didn't look at a scenario in terms of traffic
3 impacts if the mall were not there?

4

MR. VEEREGOWDA: That's correct.

5

COMM. DE LA UZ: Thanks.

6

THE CHAIR: Other questions?

7

(No response)

8

THE CHAIR: Thank you for being

9

here.

10

MR. VEEREGOWDA: Thank you.

11

THE CHAIR: Tom McKnight and then

12

Ethan Goodman and then James Conway.

13

MR. McKNIGHT: Hello, Chair and

14

Commissioners. I'm Tom McKnight, executive vice

15

president for EDC. Regarding cleanup, a lot of

16

questions have been raised by the Commission along

17

the way. I'm happy to provide clarification or

18

additional information if you need it.

19

THE CHAIR: Yes, Michelle.

20

COMM. DE LA UZ: So a lot has been

21

said about when the RFP was issued that there

22

really wasn't interest in the original proposal or

23

scheme or scope that was issued. I mean obviously

24

2008 was a very, very different economic time than

25

we are today. Did EDC consider postponing a

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

2 decision and reissuing the RFP in the current
3 economic environment to see if the original plan
4 would be viable?

5

MR. McKNIGHT: Well, actually
6 that process extended beyond 2008. The developer
7 agreement was reached last year. And the
8 proposals we received came in the fall of the
9 previous year. So it was more current. We felt
10 like the issues that came up did reflect the
11 current economic conditions, and were not
12 reflective of the economic downturn.

13

COMM. DE LA UZ: And it was
14 mentioned earlier by one of the speakers in
15 opposition that there were perhaps two or three
16 other applicants that were considered or who
17 responded to the RFP. Can you maybe just speak to
18 why EDC decided to go with the current applicant?

19

MR. McKNIGHT: Sure. There were
20 really two fundamental issues that we looked at.
21 One was -- I guess I would say three. The core
22 being is the primary vision accomplished under the
23 proposal.

24

The second was really about
25 financial viability. Each of the proposals did

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

19
20
21
22
23
24
25

require a contribution from the City. The other two were far out of range with what could be accomplished by the City.

And the third is we looked at -- I guess kind of required to -- connected to accomplishing the vision is what additional approvals are necessary. And both the other proposals require -- would have required significant changes to the development plan approved in 2008.

THE CHAIR: Angela?

COMM. BATTAGLIA: Good afternoon. We get to hear from Cornerstone on the relocation plan.

MR. McKNIGHT: Yeah.

COMM. BATTAGLIA: My question is, is EDC supervising them in their day-to-day or week to week --

MR. McKNIGHT: Yes, indeed we are, very closely.

COMM. BATTAGLIA: Thank you.

THE CHAIR: Any other questions for Tom? Yes, Anna.

COMM. LEVIN: Yes. I'd like to ask

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

2 about the role of the active recreation plan as
3 part of this. How does EDC -- I mean I can see
4 that it is a useful use for a parking lot that
5 isn't used for half the year. But it's in a
6 location where its audience is not immediately in
7 the neighborhood. What kind of economic vitality
8 or even recreational vitality do you see this
9 facility really producing?

10

MR. McKNIGHT: Well, the JV has
11 proposed a range of recreational uses, whether
12 it's basketball courts or a driving range or other
13 things that are -- that could be more substantial
14 in the off season. But that will be prepared in
15 consultation with the Parks Department, with the
16 community, to ensure that there are uses that are
17 attractive, there are uses that work well with the
18 existing uses within the park. We do think that
19 you can create a viable recreational facility
20 here, but it needs to be thoughtful about the
21 conditions and about what is going to be
22 attractive to the community.

23

COMM. LEVIN: Where do you think
24 the -- who would be the community users for this
25 facility?

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

18

19

20

21

22

23

24

25

MR. McKNIGHT: We think it's similar to the very, very large community that comes to Flushing Meadows Park today. Yes, it is, as you point out, it's not right there in the community, but nor is Flushing Meadows. And it draws in a very, very large audience from the surrounding neighborhoods.

COMM. LEVIN: I'm intrigued to see if stick ball is part of the plan. I thought stick ball needed a stoop, but --

(Laughter)

THE CHAIR: Any other questions for Tom?

(No response)

THE CHAIR: Okay. Thanks for being here.

MR. McKNIGHT: Thank you very much.

THE CHAIR: Ethan Goodman. And then James Conway.

MR. GOODMAN: Good afternoon, Commissioners, Madam Chair, Dr. Kulikowski. I'm really just sort of on behalf of the joint venture just going to finish up in case anybody has any questions for the JV.

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 I did want to augment one thing that
3 our traffic engineer said in response to
4 Commissioner De La Uz's question, the study of the
5 retail center versus no retail center. This
6 supplemental EIS did not study that because it
7 wasn't -- that plan was no longer a part of this
8 project. However, if you do look back at the '08
9 study, right, you can see what the traffic impacts
10 were in '08, which did not have a retail center
11 and envisioned 61 acres of development, versus the
12 traffic impacts that we showed now. And actually,
13 with the substantial traffic improvements that we
14 have proposed now that were actually not proposed
15 in 2008, the traffic impacts themselves have gone
16 down. Even though we have added about ten percent
17 to the overall floor area, the overall traffic
18 impacts both from the highway network and in the
19 local intersections has actually been reduced.

20 Other than that I'll just see if
21 anybody has got questions.

22 THE CHAIR: Okay, let me see.
23 Angela and then Irwin.

24 COMM. BATTAGLIA: This isn't a
25 question, and I realize we're only looking at

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

79

2 phase one right now, but I just want to say since
3 you're up here now that I was pleased to see that
4 JV and the City both in writing committed to the
5 affordable -- that 35 percent of the housing be
6 affordable. It may not be tomorrow, but I do
7 believe it will happen, and I'm glad to see that
8 it's up there. So thank you.

9 THE CHAIR: Irwin.

10 COMM. CANTOR: Your comment
11 regarding the effectively improved conditions as
12 proposed now, does that include projected forward
13 to the other acreage that is not yet on the table?

14 MR. GOODMAN: Correct. Jesse Masyr
15 cited a statistic, which actually was regarding
16 the project in front of you, and that was a 65
17 percent reduction in number of impacts. The
18 reduction, once the ultimate build-out occurs, is
19 not up to 65 percent reduction, but it is still a
20 substantial reduction in impacts on the
21 intersections of the highways. So overall this is
22 still a reduction on the highways.

23 COMM. CANTOR: Okay, thank you.

24 THE CHAIR: Any other questions for
25 Ethan?

1

2

(No response)

3

THE CHAIR: Thank you.

4

James Conway and then Dan Hendrick.

5

MR. CONWAY: Good afternoon,

6

Honorable Chair and Honorable Commissioners. My

7

name is James Conway. I'm with the International

8

Union of Operating Engineers, Local 14.

9

I'm here in favor of this

10

application. And the main reason why I am here to

11

speak in favor is that this project will create

12

20,000 sustainable jobs. Jobs that will have

13

apprenticeship training, jobs that will have

14

safety and health training, jobs that will have

15

re-skilled -- training improvements, and jobs that

16

will have technological training. It will also

17

lead to middle class jobs for our young people in

18

Queens.

19

Currently we have about 80,000

20

people unemployed in Queens. We have several

21

thousand that are returning from military service

22

to Queens. We need to create jobs for these young

23

bright people that are returning home. And this

24

is a great project, this is a great economic

25

engine to create middle class jobs for young

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

2 people of Queens and New York City. So please
3 consider approving this project.

4

Thank you.

5

6

THE CHAIR: Thanks so much for
coming, I appreciate it.

7

MR. CONWAY: Thank you.

8

THE CHAIR: Dan Hendrick.

9

MR. HENDRICK'S REP: Hi. I'm
10 actually here on behalf of Dan Hendrick, who is
11 the VP for the New York League of Conservation
12 Voters, which is a statewide organization of the
13 New York City chapter.

14

(Reading:) On behalf of the more
15 than 12,000 members of the League throughout New
16 York City, I would like to voice our support for
17 the proposal to redevelop Willets Point, and I'd
18 like to explain why.

19

Despite its proximity to downtown
20 Flushing and Corona, the Iron Triangle as it is
21 now is virtually a no-go zone for the local
22 community. As we all know, residents of this area
23 are clamoring for open space and recreational
24 opportunities. And the current use of Willets
25 Point means that the waterfront of Flushing Creek

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 and Flushing Bay is drastically underutilized by
3 the public.

4 Second are the brownfield
5 concerns. Willets Point suffers from
6 well-documented and widespread petroleum
7 contamination, with additional potential
8 contamination from paints, cleaning solvents, and
9 automotive fluids. These environmental hazards
10 are made worse by a high water table that spreads
11 pollution throughout the site. The simple fact of
12 the matter is that every day the contamination is
13 allowed to remain in the soil and groundwater is
14 another day that Flushing Creek and Flushing Bay
15 are made worse.

16 Third, the proposal for Willets
17 Point reflects a truly 21st century way of
18 thinking about urban planning. It's close to the
19 number 7 train, so people don't have to take their
20 cars everywhere. It's close to the highways, so
21 residents can get in and out quickly without
22 straining traffic further in the congested
23 downtown areas.

24 In addition to the jobs it will
25 create and the economic investment it will make in

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

83

2 Queens, this project presents what is probably the
3 best hope to finally improve the water quality in
4 Flushing Creek and Flushing Bay, while creating
5 new access points and green spaces for residents.

6 This is an important project
7 where economic growth and environmental
8 improvements go hand in hand to benefit the
9 health, well-being and vibrancy of the local
10 economy and local community.

11 Thank you very much.

12 THE CHAIR: Thank you very much.

13 Now we will switch back again to
14 speakers in opposition. First is Marco Neira.
15 Then Sergio Ageri (phonetic). And Phil
16 Konigsberg.

17 MR. NEIRA: Good afternoon,
18 everyone. My name is Marco Neira. I'm the
19 president for Sunrise Cooperative. I represent --
20 Sunrise Cooperative represents all the small
21 businesses and workers in Willets Point. The
22 reason that we are here is in order to find out
23 what's going on with our application for the small
24 businesses and workers in Willets Point. Because
25 I heard from everybody a lot of things, but

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

2 nothing for us.

3

4 I want to refresh the minds after
5 the plan was approved in 2008, and I'm going to
6 read something that I have here.

7

8 (Reading:) In November 2005, the
9 entire Fulton Fish Market, the largest consortium
10 of seafood wholesalers in the country, 37
11 businesses employing 650 workers, was relocated
12 from lower Manhattan to a new facility at Hunts
13 Point in the Bronx. The example of the relocated
14 Fulton Fish Market as an appropriate model for the
15 City to follow when relocating the Willets Point
16 tenant automotive businesses has been recognized
17 by New York City Planning Commissioners. During
18 the public hearing held by the New York City
19 Planning Commission on August 13th, 2008, for the
20 proposed Willets Point development, the following
21 exchange took place between Commissioners Karen
22 Phillips, Irwin Cantor and Angela Battaglia, and
23 New York City Economic Development Corporation
24 vice president Jonathan Gouveia. And this is what
25 they said.

26

27 Commissioner Phillips: The work
28 that you are doing with the 225 tenant businesses,

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 are the majority of those tenant businesses in
3 auto related uses? And my other question was if
4 there was any effort to identify sites, and
5 perhaps, because I know we do have the industrial
6 parks that were set up and the industrial strategy
7 that the Mayor put together a couple of years ago,
8 but in a way of creating a kind of automotive
9 related center where they could relocate, because
10 some of them benefit from, quote, "co-location."

11 Jonathan Gouveia say right.

12 Commissioner Phillips say is that
13 something that has been looked at at all in terms
14 of the areas that have been set aside for
15 industrial areas?

16 Jonathan Gouveia/EDC said, as I
17 mentioned, we haven't gotten into in-depth
18 discussions with the tenants. We've hired or
19 we're in the process of hiring a tenant
20 re-location specialist. So this sort of ongoing
21 conversation about what their businesses want,
22 where they want to locate, whether they want to
23 relocate, will become apparent through that
24 process, which will begin later or towards the end
25 of the summer.

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

86

2

(Bell rung)

3

MR. NEIRA: Through the process

4

which will begin later.

5

My last point is, we are looking for

6

a relocation because if you see by those -- by

7

that days, everything is on video and the

8

commissioner say we are going to help relocation.

9

But at this time we don't have nothing. And they

10

are serious that in sending the letters that we

11

have to leave by August. So where are we going to

12

be, on the streets. We have families, we have to

13

live. So please look for us.

14

Thank you.

15

THE CHAIR: Let me see if there are

16

any questions for you.

17

MR. NEIRA: Can he have a

18

translator.

19

COMM. LEVIN: Hold on, hold on,

20

hold on.

21

COMM. BATTAGLIA: I just want to ask

22

that you leave us a copy of your testimony. Can

23

you leave us a copy of your testimony?

24

MR. NEIRA: Oh, sure, I'm sorry, I

25

forgot. Thank you for reminding me.

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

14

15

16

17

18

19

20

21

22

23

24

25

COMM. BATTAGLIA: And sir, do you have a copy of the letter that the City sent asking you or telling you you had to relocate by August? I'd like to see that too. Can you send it to us?

MR. NEIRA: Unfortunately I don't have it with me right now but I will going to send you.

COMM. BATTAGLIA: Gracias.

MR. NEIRA: You're welcome.

THE CHAIR: Yes, Rayann.

COMM. BESSER: I wanted to ask this gentleman, have you been contacted by Cornerstone to assist you with relocating?

MR. NEIRA: Not -- they didn't contact to me because I'm in the phase two. That's why they didn't contact to me. But they contacted to my -- people in my group. And the reason that Cornerstone wants to do the relocation is individual. I told EDC we don't want the relocation individual because that way if they're going do it individually, they move one person to a certain location, and that's it, they clean their hands. If after one month the tenant can't

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

88

2 survive in that place, then he has to close that
3 place and go out of the business. So we don't
4 want that way. We want together like we are -- we
5 are only one family, so we want to continue that.
6 And I know it's big fishes against us, to let it
7 as continue doing business as a Willets Point --
8 as a Willets Point automotive repairs, because the
9 big company like trade shop companies like
10 automotive companies, they don't want to let us
11 keep going doing business as affordable places we
12 have, because it's not good for them. That's why
13 they're trying to push us out of the business.

14 We are investigating all of those
15 things. And I see Queens Chamber of Commerce,
16 they are in a group with Helen Marshall, which,
17 you know, they are working together in order to
18 kill our business. And I know they have a meeting
19 with Mayor Bloomberg in Queens. So that's why we
20 escape -- I mean we are afraid they're going to
21 kill it that way.

22 COMM. BATTAGLIA: Thank you.

23 THE CHAIR: Michelle, you had a
24 question.

25 COMM. DE LA UZ: I did.

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

23
24
25

I'm sorry, I forgot your name.

MR. NEIRA: Marco.

COMM. DE LA UZ: Marco, thank you very much for coming to testify on behalf of the Sunrise Cooperative. I think that would be helpful, if you could just share how much business between the different small Sunrise operators currently exists, because I think that's part of your reasoning for co-location.

MR. NEIRA: Yes. I mean we are -- since the project was approved we are fighting for all the businesses on Willets Point. But after they say they're going to -- they're only going to relocate that first phase, we only have 60 businesses in the first phase. Because we are 250 businesses in the whole area at Willets Point. But we cannot, like those guys say, we cannot bring those people from phase two in order to get a relocation. And I know once they start phase one, they're going to kill the other phases because that construction is going to be big, so they're going to close all the roads -- they're going to kill all the businesses. That's the way.

THE CHAIR: Other questions for

1

2 Mr. Neira.

3

(No response)

4

THE CHAIR: Okay. Thank you very

5

much.

6

MR. NEIRA: Thank you so much.

7

THE CHAIR: Phil Konigsberg. I'm

8

sorry, now is our next -- the next speaker is

9

now Sergio Ageri.

10

(Mr. Ageri speaks in Spanish)

11

THE CHAIR: You need a translator.

12

Do we have a translator? Jim?

13

STAFF MEMBER: Yeah.

14

THE CHAIR: Maybe we'll take the

15

next speaker and then --

16

MR. AGERI: Okay.

17

THE CHAIR: So Phil Konigsberg is

18

the next speaker and then we'll go back to Mr. --

19

MR. KONIGSBERG: Hello again. First

20

before -- I'm speaking against the proposal but I

21

first would like to publicly thank Related

22

Companies for recently coming out and declaring

23

nationally all their rental properties, housing

24

will be smoke free. So thank you very much

25

Related Companies.

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

14

15

16

17

18

19

20

21

22

23

24

25

I'm a member -- my name is Phil
Konigsberg. I'm a vice president of the Bay
Terrace Community Alliance, and a member of
Community Board 7. I was on the land use
committee in 2008. I was on the land use
committee this past year. I voted against the
project several years ago. And again just
recently.

And the one sticking point that has
remained is the option for eminent domain. And I
can't accept that. I've gotten to know the people
that are affected by this personally over the last
several years, and we can't allow that to
continue.

Just as it was mentioned before,
when you combine Community Board 7 and 3, the
votes were 48 against the proposal, 23 were for.

I also would like to read a
statement for the Queens Civic Congress, Richard
Hellenbrecht is the president, and he asked me to
read the following.

(Reading:) The Queens Civic
Congress is an umbrella organization consisting of
over 100 civic associations throughout the

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

2 borough. The congress has been active with
3 Flushing Meadows Park Conservancy, the Fairness
4 Coalition of Queens Safe, Flushing Meadows Corona
5 Park, and a New York City Parks advocate over the
6 past several months. The congress has in the past
7 opposed commercial development in the park and
8 remains adamantly opposed to any further
9 encroachment of public places.

10

Flushing Meadows Park is the
11 largest park in Queens and ought to serve as the
12 flagship park in Queens, but instead it has become
13 the dumping ground of last resort for placing
14 projects that no other area will accept. City
15 Field has used many acres of parkland on a deal
16 that benefits only the Mets' owners and returns
17 very little direct financial benefit to the City,
18 to Queens or to the park.

19

Parking lots surrounding the stadium
20 sit on parkland. And any change in use should be
21 subject to alienation requirements. As parking
22 lots they could be easily returned to public use
23 as open space were no longer needed. But the
24 introduction of massive steel and a concrete mall
25 to these western parking lots would permanently

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20
21
22
23
24
25

destroy a public park amenity the community should
enjoy for recreation and fun.

I'm much better when I don't
read.

Not only will the mall remove
forever land that could be used by the thousands
of nearby residents, but a mall will destroy
hundreds of nearby mom and pop businesses and
surrounding neighborhoods, introducing potentially
devastating competition to existing struggling
malls such as the malls at Atlas Park, Rego Park
and Queens Center Mall.

(Bell rung)

MR. KONIGSBERG: Furthermore --

THE CHAIR: Can you conclude your
remarks?

MR. KONIGSBERG: Sure.

Basically Queens Civic Congress,
which speaks for all the civic associations in the
Borough of Queens, has adamantly come out against
it, and we hope that you will take that into
consideration. And thank you.

THE CHAIR: Let me see if there are
any questions for you.

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

2

MR. KONIGSBERG: Sure.

3

(No response)

4

5

THE CHAIR: No. Thank you for coming, thanks for staying with this.

6

7

We do have a translator now, Jim? Jim, do we have a translator?

8

9

STAFF MEMBER: We're getting one now.

10

11

THE CHAIR: So we'll take another speaker, Mr. David Schwartz.

12

MR. SCHWARTZ: Yes.

13

THE CHAIR: And then Geoffrey Croft.

14

15

16

17

18

19

MR. SCHWARTZ: Good afternoon. I'm David Schwartz. I represent Willets Point United. And many of the arguments that I want to make have been articulated by the property owners. So I just want to try to put this in perspective without being too repetitive.

20

21

22

23

24

25

But if you think about it, you know, one of the comments made by the developer was, you know, we are going to transfer this land to private internship. And it just stuck with me. You know, think about what that means. It means stealing land from private owners, private

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 businesses, stealing the land, okay, transferring
3 it, the City taking it over, building a parking
4 lot, which has no public use whatsoever, just so a
5 private developer can buy other land for a dollar,
6 which is really parkland, okay, they buy it for a
7 dollar, and now they want to build a mall. You
8 know, you're really -- you just couldn't even make
9 this up if you thought about it. These are
10 families, these are business owners. At Willets
11 Point United we represent many of the business
12 owners in this area. And it's just scary to think
13 that the City could steal land from these private
14 businesses, people that are building the American
15 dream, people that are providing for their
16 families.

17 And I walked the district the
18 other day, I walked through the entire district.
19 There are no plans to relocate these businesses.
20 I mean the most that they've gotten is a business
21 card in the mail saying that there's some broker
22 somewhere that's going to look to relocate them.

23 And then if you go into this area,
24 you'll see the vibrancy. I mean it's been talked
25 about as a toxic waste land. Anything but. This

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 is really a jewel when you think about it, because
3 these businesses are all interrelated with each
4 other, and they all are working in conjunction
5 with each other. And that's why it's so important
6 for the relocation that these businesses are kept
7 together. And there is really, as was articulated
8 before, there is no plan to do that.

9 And also, you know, the basis of
10 this whole plan back in 2008 were two basic
11 conceptions. Living wage for retail workers,
12 which is now not part of the current plan, and of
13 course the affordable housing, the 2,000 units of
14 affordable housing, which you've heard about. And
15 there really is no plan. Had those -- had it been
16 stated back in 2008 that the affordable housing
17 would be put off for ten years on some speculation
18 that maybe our ramps will be built off the Van
19 Wyck Expressway, this plan would have never been
20 approved. This is a bamboozle which is going on
21 here.

22 And I just want to make, you know,
23 some key points which I know you've heard already
24 but I just want to bring home.

25 First, the housing. The key

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

97

2 affordable housing agreement has been abrogated,
3 pushed off into the indefinite future by the
4 developer selected by the City. As Senator
5 Peralta stated, if City Hall put a wrecking ball
6 to 2,000 units of affordable housing to make room
7 for a shopping mall, it would have been front page
8 news and there would have been no end to the
9 outrage.

10 (Bell rung)

11 MR. SCHWARTZ: And really, when you
12 think about it, that's what's happened.

13 I'm just going to state my last
14 points.

15 Living wage I spoke about. The Van
16 Wyck ramps you've heard about. Complete fiction.
17 The parkland you've heard about. Taking parkland
18 from the residents of Queens in the City of New
19 York? Outrageous. That's what they have done.

20 Corporate welfare. Two hundred
21 million dollars to buy out Willets Point, giving
22 them another \$99, and then they bought it for one
23 dollar. I mean, this is just outrageous.

24 You should reject this proposal.

25 Thank you very much.

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

98

2

3

THE CHAIR: Let me see if there are questions for you. Michelle.

4

MR. SCHWARTZ: Yeah.

5

6

COMM. DE LA UZ: Can you just -- you said Willets Point United. Who is that group?

7

MR. SCHWARTZ: Yeah.

8

COMM. DE LA UZ: Briefly.

9

MR. SCHWARTZ: Yeah. Willets Point United, there are hundreds of private businesses, entities, property owners in this area. So Willets Point United is an organization representing all of those interests. And these are real people, families, hard working people who can't believe that they own land and having the City stealing that land to give to a private developer. It's outrageous. Thank you.

18

THE CHAIR: Yes, Irwin.

19

COMM. CANTOR: Earlier in this process, I raised the question regarding the issue of eminent domain and how many parcels were yet to be, I'll use the word acquired. The indication from the City was nominally a handful. How many people do you represent who are -- who have not yet made a deal with the City on the basis of --

25

have not yet made a deal with the City?

MR. SCHWARTZ: Well, certainly in
all phases --

COMM. CANTOR: All phases?

MR. SCHWARTZ: Yeah. There's
hundreds of businesses and landowners.

COMM. CANTOR: Did you hear the
testimony earlier today?

MR. SCHWARTZ: Yes, I did.

COMM. CANTOR: He said that 95
percent of the property was taken.

MR. SCHWARTZ: Yeah. That's in
phase one. And 95 percent of the property, you
know, the tactics that were used to get these
people out of the property -- I'm not sure about
that number in phase one, by the way, but I don't
have the exact number in phase one specifically.
But the bottom line is, there are multiple phases
to this project, there are notices being given out
already. And the businesses that I spoke to in
phase one have not received any relocation advice
whatsoever. There are better ways of doing this
than to ruin an entire community in support of a
private developer.

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

16

17

18

19

20

21

22

23

24

25

COMM. CANTOR: But I don't think you responded to my question. And that is, within phase one --

MR. SCHWARTZ: Right.

COMM. CANTOR: -- one part at a time, how many affected owners are there who have not made a deal with the City? And how many of those do you represent?

MR. SCHWARTZ: Okay. I don't know how many of those people are in phase one. It could be -- it could be five percent in phase one, I'm not disputing that number on how they got to that. But I do know partially the way they got to that is they took \$200 million of our money and made sweetheart deals with the most powerful people that were in all the phases -- and some of them were in phase one -- the most powerful opposition basically bought off, and I don't blame them for taking the deal, it's a good deal for them, right. So \$200 million spent on buying those businesses off so they wouldn't be part of the opposition anymore. That's also outrageous.

COMM. CANTOR: He still didn't answer my question, did he.

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

THE CHAIR: Can you pull the speaker, can you pull the microphone a little closer to you?

THE TRANSLATOR: Oh, sorry.

MR. AGERI: They arrested 54 of the owners and the workers.

They've been having a lot of constraint and frustration, repression of -- yeah, the City has just been trying to push them out of Willets Point. They have been trying to basically make a business plan to, you know --

MR. AGERI: (In English:) We found land --

MR. AGERI: (Through the translator:) You know, they have been talking to the small businesses around there and offering, you know -- that pretty much everybody has just been playing a game with all their business plans and nobody has taken them seriously and they haven't found anywhere else to relocate.

They want to basically know about their relocation and basically where they're going to relocate, how is that going to follow through. They're basically -- because they're, you know,

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

103

2 they're poor, they're not as affluent -- they're
3 not as -- what's the word -- right, they don't
4 have funds for relocation basically.

5 So basically they made up their
6 own plan. They found land where they can
7 relocate, but nobody is taking them seriously. So
8 basically their interests are being pushed behind
9 and that other interests are being at play. So
10 basically they want you to find a solution so they
11 don't -- just don't get kicked out. And basically
12 all the other projects, like the fish market and
13 the plan up in the Bronx, they all have their own
14 plans and stuff, but why are they kicking them
15 out.

16 (Bell rung)

17 MR. AGERI: (Through the
18 translator:) In five more days they are going to
19 get their eviction and then they don't know what
20 to do. Basically please help us. They're just
21 playing games.

22 THE CHAIR: So ask him to wait and
23 maybe there are questions from the Commission.

24 COMM. CANTOR: Yes.

25 THE CHAIR: Irwin.

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

COMM. CANTOR: He made the observation, he said they found some property but no one is taking them seriously. Could we get that expanded upon?

MR. AGERI: (In English:) Yeah.

MR. AGERI: (Through the translator): Basically in 2008 they asked EDC about relocating people, they found some land. But they told them that no, it wasn't -- they can't use it. But they went back to their own study?

MR. AGERI: (In English:) Yeah.

MR. AGERI: (Through the translator:) They found their own --

AUDIENCE MEMBER: They found their own sites, but EDC didn't help them out.

MR. AGERI: (In English:) Yeah.

MR. AGERI: (Through the translator:) So they just didn't ask for the business plan.

MR. AGERI: (In English:) Yeah.

You'll see it in this plan. I'll give you a copy of it.

THE TRANSLATOR: He has a copy of

it.

COMM. CANTOR: They were ignored?

MR. AGERI: (In English:) Yeah,

they never answered to us.

THE TRANSLATOR: Yeah, they never

answered to us.

MR. AGERI: (In English:) We wanted

relocation. We want to talk about relocation,

where is the site, how much they are going to put,

how many people we have available to move over

there. We don't have that kind of a cushion. We

have manipulation but we don't have answer. In

five days we are going to receive a letter from

the EDC, everybody have to go in phase one,

because of this.

COMM. CANTOR: Thank you.

THE TRANSLATOR: From what it sounds

like, he just never got an answer.

THE CHAIR: Maria. You want to do

it in Spanish?

(Dialogue between Comm. Del Toro and

Mr. Ageri in Spanish)

COMM. DEL TORO: Yeah, 60 shops.

MR. AGERI: (In English:) Yeah.

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

2 (Dialogue between Comm. Del Toro and
3 Mr. Ageri in Spanish)

4 COMM. DEL TORO: And 300 jobs.

5 (Dialogue between Comm. Del Toro and
6 Mr. Ageri in Spanish)

7 COMM. DEL TORO: He said 54 --

8 COMM. CANTOR: How many of those
9 sites has the City already taken over?

10 THE CHAIR: What were you going to
11 ask?

12 COMM. CANTOR: I was going to ask
13 Maria how many of those 50 or 60 sites that are
14 currently being affected have already made deals
15 with the City.

16 (Dialogue between Comm. Del Toro and
17 Mr. Ageri in Spanish)

18 COMM. DEL TORO: Collectively as a
19 group they have not accepted Cornerstone.

20 THE CHAIR: So I think what we'd
21 like to have from the Economic Development
22 Corporation is kind of a summary of where we were
23 in 2008 when the plan was approved, because the
24 understanding was that there would be --
25 Cornerstone would do a massive engagement with the

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

107

2 local businesses and do everything they could to
3 relocate them. So let us get a update on that and
4 where -- how many were relocated, how many are not
5 relocated, just the status of where the businesses
6 are. And what the time frame is, because we're
7 hearing five days, we are not going -- we don't
8 understand why that is. We're not even through
9 ULURP. So I don't know if you can tell him that,
10 but ask for a status report, if you could explain
11 that to him. Thanks, Maria.

12 (Dialogue between Comm. Del Toro
13 and Mr. Ageri in Spanish)

14 MR. AGERI: Mucho gracias. Thank
15 you so much.

16 COMM. DEL TORO: Mucho gracias.

17 THE CHAIR: Orlando Marin has a
18 question.

19 (Dialogue between Comm. Marin and
20 Mr. Ageri in Spanish)

21 COMM. MARIN: They're looking for
22 relocation as a group because of the fact that as
23 a business entity they do better as a group. And
24 that legal cooperative has 50 members out of 54,
25 which is why four of them may have chosen to go

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

separately.

THE CHAIR: So it's important for
them to be in a cooperative.

(Dialogue between Comm. Marin and
Mr. Ageri in Spanish)

MR. AGERI: (In English:) Yeah.

COMM. MARIN: Gracias, thank you.

MR. AGERI: (In English:) Okay,
thank you.

THE CHAIR: We have a few more
speakers. Geoffrey Croft. Geoffrey Croft, yes.
And Giovanna Reid. Geoffrey Croft.

MR. CROFT: Good afternoon. My name
is Geoffrey Croft, president and founder of New
York City Park Advocates.

It is truly a sad day in City
Planning when we are talking about a plan that
seizes more than 30 acres of public parkland to
allow one of the country's largest developers to
build the largest mall in New York City. It
sounds inconceivable, right? Just when you
thought this administration couldn't get any
lower, here we are today.

Let's not forget the Related

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1
2 Companies and Sterling's original plan for our
3 public parkland, building a massive casino and
4 retail complex. Let's be very clear. The 1961
5 statute that the City and the applicants are so
6 desperately trying to rely on in order to justify
7 being allowed to develop the public parkland for
8 non-park purposes does not permit any shopping
9 mall, much less a 1.4 million square foot mall.
10 Administrative Code 18-118 explicitly states that
11 any moneys gained from a temporary lease on the
12 property must go back into the property. Back
13 into the property. Not line the pockets of
14 Related or Sterling Equity.

15 To quote the law directly, the
16 revenue must, quote, "Aid in the financing of the
17 construction and operation of such stadium,
18 grounds, parking areas and facilities and any
19 additions, alterations or improvements thereto or
20 to the equivalent thereof." Clearly, this is not
21 the case, unless the applicant is representing
22 that this is being done to offset unfortunate
23 investments made by the Wilpons. Is that the
24 plan?

25 Clearly, the intention of the law

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

110

2 was not to allow any project to make a permanent
3 claim on parkland or its facilities because the
4 revenue was supposed to fund the property. The
5 law simply does not authorize the Willets Point
6 West project. It does not enable use of the
7 parking lot or authorize retail stores, and
8 certainly something that is not primarily --
9 something that is primarily a shopping mall.

10 The parkland we are talking about
11 here today for this irresponsible project was
12 never alienated as required under state law, nor
13 are they planning to. Nor are they planning to
14 replace if approved.

15 The language in your calendar today
16 states that the project would, quote,
17 "Incorporate, aid, develop the development
18 substantially similar to that anticipated and
19 analyzed in the 2008 Willets Point development
20 plan", et cetera. Is that a joke? Who wrote
21 that, the applicant?

22 The public parkland was never part
23 of the original plan in any way. In any way. And
24 it certainly was never approved by the City
25 Council. There is just no getting around the fact

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

111

2 that this 1.4 million square foot mall is a
3 totally new project than what was approved by City
4 Council. And as you -- this is nothing but an
5 end-run around the law, and the City Planning will
6 be complicit if you rubber stamp its approval.
7 This is public parkland. It does not belong to
8 Mayor Bloomberg or EDC or the Related Companies or
9 the Wilpons. It belongs to the people of the City
10 of New York. If the 30 plus acres of public
11 parkland they are now attempting to seize for the
12 project were no longer needed for parking for the
13 Mets, then it should revert back to its original
14 use.

15 (Bell rung)

16 MR. CROFT: This is what our elected
17 officials should be pushing and what any
18 legitimate city planning agency would insist on,
19 and not instead allow our public spaces to be
20 given away to politically connected developers.
21 It's disgraceful. This is about greed, pure and
22 simple, and it's a nightmare for the communities
23 on so many different levels. We do hope you
24 seriously look at this project.

25 THE CHAIR: Thanks. Let me see if

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

112

2 there are any questions for you, Mr. Croft.

3 (No response)

4 THE CHAIR: There are not, but we
5 appreciate -- was there one?

6 COMM. LEVIN: Well, I was --

7 THE CHAIR: Anna. I'm sorry, Anna,
8 I didn't see your hand.

9 COMM. LEVIN: Well, it was going up
10 slowly.

11 (Laughter)

12 COMM. LEVIN: I think you've heard
13 from the developer and the City, and I'm sure
14 you've seen the City Law Department's analysis of
15 the --

16 MR. CROFT: Recommendation?

17 COMM. LEVIN: -- administrative
18 code.

19 MR. CROFT: Yes.

20 COMM. LEVIN: I think this really is
21 the long hand of Robert Moses here, because in
22 addition to allowing stadiums, which is what the
23 regulation was all about, you read through a long
24 list of other things and you get down to one of
25 the -- the last permitted use is the approvment

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

113

2 of trade and commerce. How do you square that
3 piece of language with what you're urging us to
4 do?

5 MR. CROFT: Again, it's, you
6 know, that was one part. I have all of the
7 language here as well. Robert Moses was, you
8 know, for better or for worse certainly protecting
9 parkland. But again, the funds were supposed to
10 be -- were supposed to go back to this property
11 and -- unless the Wilpons and Related are saying,
12 you know, that -- if they're claiming that this is
13 being used for those purposes. We certainly do
14 not agree with the City's interpretation of that
15 1961 statute. There's certainly enough language
16 in that statute we think that bolsters our claim.

17 COMM. LEVIN: It certainly makes it
18 clear that the purpose at that time was a stadium,
19 but --

20 MR. CROFT: Right. And now, and
21 now --

22 COMM. LEVIN: Very widely written.

23 MR. CROFT: Well, it is wide, it
24 is -- I mean you can interpret it that way. But
25 if you actually look line by line, we think it's

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

114

2 very clear that it was not supposed to be used for
3 these purposes. And clearly there's no, you know,
4 part -- no allowing it to be used for a shopping
5 mall. And I think that's very, very obvious. I
6 mean again, we're reading straight from that.
7 And, you know, we feel that it should definitely
8 be -- I mean look, this is going to wind up in
9 court anyway, which is sad. But, and we feel
10 very, very strongly that if -- again, if the Mets
11 no longer need this then, this 30 acres of public
12 parkland, and if any of the Commissioners, which
13 I'm sure you have been reading about what's going
14 on in Flushing Meadows, Corona park, this is one
15 project out of three potential projects. And that
16 community has been -- and those parklands have
17 been, you know, used for more and more commercial
18 purposes. And a mall -- and again, which no one
19 else has mentioned, there is a mall a half a mile
20 from this site. So, you know, giving it away for
21 a dollar, and clearly -- and Commissioner Cantor,
22 I appreciated your questions early on in this
23 about asking why, you know, to the City -- I mean
24 clearly if you're giving 30 acres of free land,
25 this is the money tree. I mean that's why they're

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

115

2 able to. Who, you know, who knows if this housing
3 will ever be built. But this is the low hanging
4 fruit for the Related Company and for the
5 applicants. The problem is that we're all paying
6 for that. So taking away from the parkland is not
7 a good idea, I mean in many different ways. But
8 you know, again, that land should be restored if
9 it's no longer needed.

10 THE CHAIR: Yes, Michelle.

11 COMM. DE LA UZ: Thanks for your
12 testimony, I was hearing it over there. Just I'm
13 just wondering if in the process, either the ULURP
14 process or the borough president's process, if the
15 City has actually shared in writing the
16 interpretation of the statute that you've talked
17 about, or is everything that you've stated about
18 the interpretation based on statements that they
19 have made publicly.

20 MR. CROFT: We have -- I mean I
21 didn't -- my testimony is that -- you guys always
22 run over the three minute mark, so we always
23 appreciate your questions. I mean I can certainly
24 email you the statements from the Law Department.

25 We are always, as you guys know, we

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

1

116

2 are very diligent about our facts. So we do have
3 quotes directly from them about, you know, the
4 whole parkland alienation stuff.

5 You know, they feel that they,
6 you know, don't have to and that that language
7 wasn't in there and that's -- often that is the
8 case, which is not accurate as well. Because, as
9 we know in the Yankee Stadium project which came
10 before you here and the Bryant Park and the Van
11 Cortlandt, and that's, you know, the alienation
12 language is very explicit.

13 And getting back to your -- I think
14 that definitely speaks to that. The language was
15 never meant to be alienated. And again, if you
16 look at the language, you know, in total, I think
17 that is clear. And, you know, the City would love
18 to -- you know, obviously they're going to argue
19 very differently about that interpretation. But
20 certainly from a policy thing we would hope that
21 City Planning would table this at least until, you
22 know, this, you know, this gets worked out. But,
23 you know, yeah.

24 THE CHAIR: Other questions for
25 Mr. Croft?

-----ROY ALLEN & ASSOCIATES, INC., 212-840-1167-----

THE CHAIR: Thank you for being
here.

MR. CROFT: Thank you very much for
your questions.

THE CHAIR: Giovanna Reid.

MS. REID: Good afternoon,
Commissioners. I want to thank you for this
opportunity to speak to you this afternoon about
the needs and concerns of Community Board 3 in
respect to the Willets Point project.

Under ULURP Section 2-03, item G,
which allows for the review and vote of actions
not in a community board district, Community Board
3 took up this matter. For the reason that while
Willets Point may be geographically located within
Community Board 7, the proposed action will
directly impact more than 250,000 residents in
Community Board 3. Our border is merely a couple
of blocks from the site, and therefore, any and
all actions that take place at Willets Point will
directly impact the residents of our board.
Therefore, on May 23rd, 2013, we held a public
hearing and then voted, without the benefit of a

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 presentation by the applicant. After careful
3 review of the proposal, the board concluded that
4 the plan in its present form be disapproved for
5 the following reasons.

6 CB3 is opposed to constructing a
7 mall on active parkland. We are opposed to the
8 planned development schedule. The plan calls for
9 soil remediation of 23 out of 62 acres of the
10 proposed site, which would be in phase 1A of the
11 project. The anticipated completion date would be
12 2018. That is the mall and the hotels and all
13 those wonderful things. However, affordable
14 housing and the construction of a high school and
15 an elementary school, which is sorely needed in
16 this area, won't come about until 2028, a whole
17 ten years from the initial project. Mind you,
18 that is all contingent upon the expansion of the
19 expressway and all of that. The aforementioned,
20 as I said, is sorely needed.

21 What is not addressed in the
22 proposal are the impacts, and the impacts of
23 traffic as it relates to Community Board 3. While
24 the applicant did do a study, it did not look at
25 the concerns in the immediate areas, Community

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

25

Board 3 and 4.

Let me also make note of the fact that the portion of Community Board 7, there is only one resident. Whereas, a couple of blocks away, we're talking about 250,000 residents. And the paperwork that we saw does not reflect any of the concerns affecting Community Board 3 and 4.

The traffic studies that were conducted did not include mitigation for 114th Street, Astoria Boulevard, 34th Avenue, Roosevelt Avenue and Northern Boulevard, just to mention a few. It did not consider the impact of public transportation, solely our number 7 train, which is already overtaxed.

(Bell rung)

MS. REID: And difficult to provide services.

Just in general, there was no discussion about the displacement of the residents and the businesses, the impacts it's going to have. We have small mom and pop stores that are going to be impacted by this proposed plan.

If I can just take one more moment.

In 2008, the borough president in her

recommendation suggested that --

THE CHAIR: Okay, you do need to
wind up.

MS. REID: Right.

THE CHAIR: I know that you're --

MS. REID: All I'm going to talk
about is the advisory -- advisory board, which
entailed discussions with the applicants of
what -- Community Board 7, 3, 4, local officials.
That did not happen this time around. And I
implore City Council, City Council, City Planning,
all involved in the process to seriously look at
that. Perhaps go back to the table and
incorporate all of the things that this body has
been presented this afternoon.

I thank you for the opportunity to
speak with you.

THE CHAIR: Let me see if there are
questions for you, Ms. Reid.

(No response)

THE CHAIR: There are not.

MS. REID: Okay.

THE CHAIR: But we thank you so much
for being here.

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

121

2

MS. REID: Thank you.

3

THE CHAIR: And for your testimony.

4

5

Is there anyone else who would like
to speak on this item who hasn't done so already?

6

7

Yes, you'd like to speak? Then fill
out a speaker card. And just introduce yourself.

8

9

MS. HACK: I'm Sylvia Hack,
president of the Kew Gardens Improvement
Association. I'm also co-chair of the land use
committee of Community Board 9, and a past chair.
You may remember the community board, and I was a
member of the community board that voted against
further alienation of parkland for the USTA, and
that was 1.68 acres.

16

17

18

19

20

21

22

Unfortunately, I don't know why,
normally we are always involved when parkland for
Flushing Meadow Park comes into play. But we were
not involved; therefore, I cannot speak for the
board. But we did defeat for .68 acres. So I can
honestly say that my board thought it was a joke
when we first read about a mall.

23

24

25

You know, this is like murder. This
park is being murdered piece by piece by piece.
And it's all for greed. Now, if it's so wonderful

____ROY ALLEN & ASSOCIATES, INC., 212-840-1167____

100 Church Street, 8th floor, New York, New York 10007

626 RXR Plaza, Uniondale, New York 11556

2 to have these things, I don't understand why
3 Central Park never gets looked at or Prospect Park
4 never gets looked at. This never happens.

5 And the issue of alienation of
6 parkland. You know, in this state you can't
7 transfer a liquor license. In other words, if I
8 bought a store that was a liquor store or a bar, I
9 couldn't simply pick up that license. I have to
10 go back and I have to get new approval from the
11 SLA and have advice from the community board.

12 So how is it that property, 30 acres
13 or so, which was alienated for City Field, is now
14 being blithely thought of as translated -- I'm
15 sorry, transferred for the use of a mall? That is
16 outrageous and it's -- really it's -- I have sat
17 here, you know, and I've been involved in civics
18 for 40 years, and I have rarely sat in two such
19 diametrically opposed hearings. You know, the
20 Hallets Cove hearing, everybody was working
21 together to accomplish something. You have here
22 I'm listening to people who are going to lose
23 their businesses, their jobs. This city managed
24 to move the fish market. It built the Essex
25 Market and renewed it for people. This city also

626 RXR Plaza, Uniondale, New York 11556

1

123

2 needs people and companies that repair cars. So I
3 don't understand.

4 And as far as EDC is concerned, I
5 can tell you we've had lots of dealings with EDC.
6 EDC does not follow up. We now have a particular
7 issue that we are going to bring back to EDC
8 because they don't really pay close attention
9 after they have finished with what they're doing.

10 I can only say that I am rarely at a
11 loss for words. But after hearing everything
12 that's gone on here today, and listening to the
13 developers and listening to the people, I really
14 am at a loss for words. And if we can't transfer
15 a liquor license in this state, we shouldn't be
16 transferring 30 acres of public parkland.

17 THE CHAIR: Let me see if there any
18 questions for you just before you move on.

19 (No response)

20 THE CHAIR: There are not. But
21 thank you for being here, thank you for staying.

22 Is there anyone else who would like
23 to speak who hasn't done so?

24 (No response)

25 THE CHAIR: All right.

So the record will remain open for
ten days, to July 22nd, and to receive written
testimony on the Draft Environmental Impact
Statement. And this hearing is closed.

(Time noted: 2:49 p.m.)

C E R T I F I C A T E

STATE OF NEW YORK)
COUNTY OF ORANGE) SS:

I, KARI L. REED, a Registered
Professional Reporter (Stenotype) and Notary
Public with and for the State of New York, do
hereby certify:

I reported the proceedings in the
within-entitled matter and that the within
transcript is a true record of such proceedings.

I further certify that I am not
related, by blood or marriage, to any of the
parties in this matter and that I am in no way
interested in the outcome of this matter.

IN WITNESS WHEREOF, I have hereunto
set my hand this ___ day of July, 2013.

KARI L. REED, RPR

Auburndale Improvement Association, Inc.
P.O. Box 580331, Station A
Flushing, NY 11358
July 10, 2013

New York City Department of City Planning
22 Reade Street
New York, NY 10007

To the City Planning Commission:

My name is Henry Euler and I am the First Vice President of the Auburndale Improvement Association, Inc. My testimony today is on behalf of my civic organization. We are the oldest and geographically the largest civic group in Queens County and our membership numbers close to six hundred families and individuals living in Auburndale Flushing and western Bayside.

We are very concerned about the three proposed projects to be constructed on parkland at Flushing Meadows Corona Park. These projects include expansion of the tennis center, the building of a soccer stadium and the construction of a huge mall. We oppose all three proposals.

Today you are considering the proposal dealing with the 1.4 million square foot mall to be constructed on the parking lot to the west of Citi Field. This land is parkland and should be off limits to any private development. Parkland is sacrosanct. It belongs to the people, not private developers. With the rate of intense development in Queens, we need all of the green space we can spare.

The asphalt on the unused part of the parking lot to the west of Citi Field should be removed and trees and other vegetation should be planted on the site in order to make it look more like a park once again. There is no shortage of people living in close proximity to the park, or even further away, who could use that refurbished parkland.

Have you seen how many people use Flushing Meadows Corona Park? It is staggering. How could anyone think of usurping land for private gain when people living in overcrowded neighborhoods look to the park as their backyard and a source of relaxation, exercise and tranquility?

And what will happen to local businesses if this mall is completed? And what is the impact on traffic and quality of life in the surrounding community if the mall is built? Is this land, where the mall is to be built, stable enough to support the structures to be built on the site? This area was originally wetland.

There are so many questions to consider in this case, and so many concerns. We stand with the coalition known as Save Flushing Meadows Corona Park and our neighbors in western Flushing and Corona. No mall in this location! Just preserve the parkland and find additional funds to sustain and maintain our precious park. Thank you!

Henry Euler, First Vice President 
Auburndale Improvement Association, Inc.

Supplemental Environmental Impact Statement Special Willets Point District

The Queens Development Group plan is to clear the Willets Point junkyards from the sightline of CITI field with a parking lot, and a hotel built on the Special Willets Point District, that was approved in 2008.

There would be very little discussion if it stopped there. But now they have moved out of the approved special district into mapped parkland. They have requested 30.7 acres to build a 1.4 msf. SHOPPING MALL.

They refer to this land as Willets West; let's be honest this is Corona. They would also like us to believe that Willets Point is Downtown Flushing. This is like referring to Washington Heights as Upstate Manhattan.

Community boards 3 and 7 have held public hearings on the application. The vote at CB 3 was 30 against, 1 for and one abstention. CB 7 voted 22 for and 18 against. We request you to break the tie and say no.

There are a several solid reasons to say no:

- 1. First, there is no plan to replace the 30.7 acres of parkland**
- 2. Second, the 1961 law referenced in the application as justification for the Mega Mall is wishful thinking. The Urban Justice Center has issued an opinion that there is nothing in the law that even hints of the building of a Mall. It does address possible development but only as it relates to a Sports venue**
- 3. Third, the demolition of the Empire Millwork Corporation building, which is on the State and National registers of historic places**
- 4. Fourth, the traffic increase will be beyond the capacities of both highways and side streets**

5. Fifth, transit and pedestrians: the number 7 train will need a double deck

Promises made but not kept. Affordable housing was a key element in voting for the 2008 application. It was the number one priority, now Phase 2 with the promise of a 35% for affordable housing has a scheduled completion of 2032.

The Economic Development Corporation is the sponsoring agency. They are responsible for two contrary statements in the body of the application:

- 1. "... capture retail spending currently lost to surrounding suburbs"**
- 2. "It would not raise retail capture rates within a 5-mile Primary Trade Area"**

If the second statement is correct then they are willing to put existing Queens Malls into bankruptcy , like Atlas Mall in Middle Village.

The city estimate for remediation in 2008 was \$400m for the entire 63.1 acres of the Special Willets Point District. The developers at the CB 7 public hearing said between \$30 to \$40m but could be considerably higher. It becomes obvious that no serious remediation will occur until Phase 2; that is not part of this application.

The estimated cost is \$3B for Phase 1 A & B but they have an out clause of \$35m. These developers are "kicking the can" down the road.

We urge you to say no.

**City Planning Commission
July 10, 2013**

My name is Dan Hendrick, and I am Vice President at the New York League of Conservation Voters, a statewide organization with a New York City Chapter.

On behalf of the more than 12,000 members of the League throughout New York City, I would like to voice our support for the proposal to redevelop Willets Point and I'd like to explain why.

Despite its proximity to downtown Flushing and Corona, the Iron Triangle as it is now is a virtual "no-go" zone for the local community. As we all know, residents of this area are clamoring for open space and recreational opportunities, and the current use of Willets Point means that the waterfront of Flushing Creek and Flushing Bay is vastly underutilized by the public.

Second are the brownfield concerns. Willets Point suffers from well-documented and widespread petroleum contamination, with additional potential contamination from paints, cleaning solvents, and automotive fluids. These environmental hazards are made worse by a high water table that spreads pollution throughout the site. The simple fact of the matter is that every day that contamination is allowed to remain in the soil and groundwater is another day that Flushing Creek and Flushing Bay are made worse.

Third, the proposal for Willets Point reflects a truly 21st century way of thinking about urban planning. It is close to the Number 7 Train, so people don't have to take their cars everywhere. It is close to the highways so residents can get in and out quickly without straining traffic further in the congested downtown area.

In addition to the jobs it will create and the economic investment it will make in Queens, this project presents what is probably the best hope to finally improve water quality in Flushing Creek and Flushing Bay – while creating new access points and green spaces for residents.

This is an important project where economic growth and environmental improvements go hand-in-hand to benefit the health, well-being and vibrancy of the local economy and local community.

Thank you.

Queens Civic Congress
Testimony Concerning Proposed Willets Point West Mall
at Flushing Meadows Corona Park

June 6, 2013

The Queens Civic Congress is an umbrella organization consisting of over 100 civic associations throughout Queens. The Congress has been active with the Flushing Meadows Corona Park Conservancy, the Fairness Coalition of Queens, and Save Flushing Meadows Corona Park over the past several months. The Congress has in the past and remains adamantly opposed to any further commercial development in the Park. The Queens Civic Congress Platform, entitled Civic 2030, adopted and endorsed by the full Congress in 2008 and ratified by resolution in December 2012, includes the following statements:

15. Support the Flushing Meadows Corona Park Conservancy.
16. Protect Flushing Meadows Corona Park from any further commercial and corporate exploitation.
17. Impose a moratorium on all new construction/development of non-public-benefit projects in Flushing Meadows Corona Park pending completion of a Master Plan by a Commission that has public members.

Flushing Meadows Corona Park is the largest park in Queens and ought to serve as the flagship park in Queens, but instead has become the dumping ground of last resort for placing any project that no other area will accept. While we gladly accept the long standing cultural facilities such as the Queens Museum and Theater and Hall of Science and Zoo, the more recent move of the US Tennis Center and US Tennis Open to the park and its recent expansion has been a serious encroachment on precious parkland that could and should be enjoyed by residents of Queens. CitiField has taken additional acres of public land on a deal that benefits only the Mets owners with very little direct financial benefit to the City and no benefit to Queens or to the Park. The parking lots surrounding the stadium sit on parkland and any change in use should be subject to alienation requirements. As parking lots they could be easily removed and returned to public use.

But the introduction of a massive steel and concrete, brick and mortar mall to these western parking lots would permanently destroy what the community should enjoy as a public park amenity. In addition to removing forever land that could be used by the thousands of nearby residents, the mall would destroy hundreds of nearby "mom-and-pop" businesses, small boutiques and restaurants in surrounding neighborhoods and would introduce significant and possibly devastating competition to existing, struggling malls, such as the beautiful Atlas Park Mall in Glendale and even Queens Center Mall.

Queens Civic Congress and fellow organizations believe that FMCP has been intentionally neglected by the City by providing inadequate maintenance budgets and minimal capital improvements over decades, resulting in a untidy and disorganized park. None-the-less, the Park serves as the backyard to tens of thousands of working class and middle income workers from nearby neighborhoods. The lack of upkeep seems to justify to the city its ability to propose commercial and corporate projects such as a Major League Soccer Stadium, the tennis center and this mall. Despite the terrible condition of the Park, on this Memorial Day there was not a square inch of space available to put down a blanket or park a car.

People with barbeques and badminton, boom boxes and soccer were everywhere enjoying the outdoors space that is not available on their blocks.

If, as the City is proposing, the CitiField parking lots could be repurposed, the space could better be used by the people for additional picnic and recreation space, not for stores and movie theaters that have questionable demand and little or no access. There is no pedestrian traffic nearby to support a mall and residential development plans for Willets Point remain unclear and far in the future.

Queens Civic Congress urges the Borough President to oppose this project unequivocally. Willets Point West is an unjustified, unnecessary and inexcusable abuse of the City's land use powers. We believe that the project is also in violation of parkland alienation regulations and should be reviewed by the State. The justification to avoid these regulations seems to be that a lease agreement provides to a private entity unrestricted use of the land, but we contest that a lease could supersede contradictory parkland alienation legislation.

Borough President Marshall, please continue to make your permanent and lasting mark on Queens by preserving open space at Flushing Meadows Corona Park and just say "No."

Richard C. Hellenbrecht, President

president@gccnyc.org

Testimony of Gerald Antonacci
at public hearing of City Planning Commission
re: proposed Willets West mall / Willets Point development
July 10, 2013

Hello. I'm Gerald Antonacci, the owner of Crown Container Company and a member of Willets Point United.

Let's get one thing straight: The ONLY reason there's an application to put a parking lot at Willets Point, is to accommodate building a 1.4 million square foot shopping mall on parkland located next to Citi Field. The effect of this application – if approved – is to allow that mall to be built.

At the review session on Monday, a commissioner mentioned that perhaps Sterling and Related need the profits from the mall, to pay the cost of remediation at Willets Point. That is totally incorrect, because there is a \$99 million dollar grant of taxpayer funds to Sterling and Related that they will use to pay for remediation. Make no mistake: Any profits from the mall go straight to Sterling and Related, and remediation does NOT depend on the mall because WE are paying for it.

The entire proposal of Sterling and Related is a bad idea for the following reasons:

UNNECESSARY MALL IS PRIORITIZED

We don't need any shopping mall at that location. If one is built, it will destroy existing shopping districts in Corona and Jackson Heights.

PARKLAND SACRIFICE: 30+ ACRES

Building a shopping mall on public parkland is not appropriate.

TRAFFIC NIGHTMARE

Even with the hypothetical mitigation measures in place, there will be very severe traffic impacts – including gridlock conditions at local intersections. From the developer's own mitigation report (DSEIS chapter 21): Delays of 821 seconds, 273 seconds and 226 seconds – even WITH the most optimistic mitigation measures in place.

Meanwhile, the report does not even guarantee the "feasibility" or "effectiveness" of the recommended mitigation measures – but proceeds to rely on them.

Back in 2008, the City Planning Commission's report noted that the city would "monitor" traffic impacts of this development. But when people are frozen at intersections during the project's 821 second delays, what difference will it make if the city is "monitoring" those delays? At what point, as city planners, do you wake up and say, "This will not work?"

For more detailed information, see the report of engineer Brian Ketcham that is attached to this testimony.

NO VAN WYCK EXPRESSWAY RAMPS

Despite all the talk about new access ramps to and from the Van Wyck Expressway, the project contract specifies that, "for the avoidance of doubt, in no event shall EDC or the City be required to construct the Ramps as part of the development". And without those ramps, ONLY Phase 1A (essentially, the mall) can be built.

NO HOUSING

Housing and affordable housing were touted as the linchpins of this project during 2008. But their construction is being delayed until the year 2025, while the mall is prioritized instead. There's also a contractual "out" clause, allowing Sterling/Related to pay a "cost-of-doing-business" penalty and then build NO housing. In addition, NO housing can be built unless the Van Wyck ramps are built first – but no one is obligated to build the ramps. The developers and the city have deliberately structured their contract to prioritize the mall, while delaying the housing and not ensuring that the ramps – which are prerequisites for the housing – will ever be built. That is tantamount to eliminating the housing.

COSTS SHIFTED TO TAXPAYERS

Contrary to what the City Council was told during 2008, the city will not recoup the value of the Willets Point Phase One property – in excess of \$200 million – but instead, will give it to Sterling/Related for the price of \$1 (one dollar). Also contrary to what the City Council was told, remediation and other costs will not be paid by the developers, but by the taxpayers – as Sterling/Related will receive a \$99 million grant of taxpayer funds, to cover their development costs.

REMEDICATION CHARADE

Several weeks ago at community board 7, Sterling/Related and the city were challenged to produce any scientific reports proving the existence of alleged hazardous contamination at Willets Point. Given that the city claims to own over 90 percent of Phase One property, the city is certainly able to conduct tests on that land. Not only did Sterling/Related and the city not produce any such report, but for several years the city has rented Phase One properties to scores of tenant businesses – which the city could not do, if the area was actually hazardous to anyone. Significantly, Dr. James Cervino – a geochemist who is affiliated with the Woods Hole Oceanographic Institution and is also Chair of the CB7 environmental committee – voted to DENY this Willets West mall / Willets Point development application. If there really was an urgent need to remediate any hazardous contamination at Willets Point, a scientist such as Dr. Cervino would be expected to have approved this application instead of rejecting it.

EMINENT DOMAIN ABUSED FOR PRIVATE ENRICHMENT

43 states other than New York have enacted laws to prohibit or curtail the use of eminent domain for economic development. Last year, the U.S. House of Representatives passed a bill that would cancel federal economic development funds to any state where eminent domain is used for economic development. The rest of the country and Congress have sided with property owners on this, and it is Mayor Bloomberg and the city administration that are out on a limb and using inappropriate, un-American tactics for this project.

Is it any wonder that there is strong public opposition to this application?

The Queens Civic Congress, an umbrella group representing more than 100 Queens civic organizations, has issued a letter opposing this application.

Queens Community Board 7 initially DENIED this application in its committee by a vote of 7-2, then the full board later approved it by a narrow margin of 22-18 only after arm-twisting by the city.

Community Board 3 also held a public hearing and voted pursuant to ULURP, with a near-unanimous vote of 31-1 to DENY this application. They do not want the mall on parkland, and they reject the developers' claim that a mall will not impact existing shopping districts.

Please reject this application. Let the city issue a new RFP, and let the respondents conform to the parameters and goals of the project that was approved during 2008.

Finally, please use your own judgment and conscience to decide this application – not favoritism to Mayor Bloomberg or anyone else who appointed you to the Commission.

APPROVE THIS PROJECT ???

- ✓ **Unnecessary Mall Prioritized**
 - ✓ **Parkland Sacrifice: 30+ acres**
 - ✓ **Traffic Nightmare**
 - ✓ **No Van Wyck Expressway Ramps**
 - ✓ **No Housing**
 - ✓ **Clever Contractual “Out” Clauses**
 - ✓ **Costs Shifted to Taxpayers**
 - ✓ **PROPERTY GIVE-AWAY: 23 ACRES FOR \$1**
 - ✓ **\$99 MILLION GRANT TO STERLING/RELATED**
 - ✓ **Remediation Charade**
 - ✓ **Eminent Domain Abused for Private Enrichment**
-

“For the avoidance of doubt, in no event shall EDC or the City be required to construct the Ramps as part of the Development.”

– Contract Section 3.3

Queens Civic Congress

Testimony Concerning Proposed Willets Point West Mall at Flushing Meadows Corona Park

June 6, 2013

The Queens Civic Congress is an umbrella organization consisting of over 100 civic associations throughout Queens. The Congress has been active with the Flushing Meadows Corona Park Conservancy, the Fairness Coalition of Queens, and Save Flushing Meadows Corona Park over the past several months. The Congress has in the past and remains adamantly opposed to any further commercial development in the Park. The Queens Civic Congress Platform, entitled Civic 2030, adopted and endorsed by the full Congress in 2008 and ratified by resolution in December 2012, includes the following statements:

15. Support the Flushing Meadows Corona Park Conservancy.
16. Protect Flushing Meadows Corona Park from any further commercial and corporate exploitation.
17. Impose a moratorium on all new construction/development of non-public-benefit projects in Flushing Meadows Corona Park pending completion of a Master Plan by a Commission that has public members.

Flushing Meadows Corona Park is the largest park in Queens and ought to serve as the flagship park in Queens, but instead has become the dumping ground of last resort for placing any project that no other area will accept. While we gladly accept the long standing cultural facilities such as the Queens Museum and Theater and Hall of Science and Zoo, the more recent move of the US Tennis Center and US Tennis Open to the park and its recent expansion has been a serious encroachment on precious parkland that could and should be enjoyed by residents of Queens. CitiField has taken additional acres of public land on a deal that benefits only the Mets owners with very little direct financial benefit to the City and no benefit to Queens or to the Park. The parking lots surrounding the stadium sit on parkland and any change in use should be subject to alienation requirements. As parking lots they could be easily removed and returned to public use.

But the introduction of a massive steel and concrete, brick and mortar mall to these western parking lots would permanently destroy what the community should enjoy as a public park amenity. In addition to removing forever land that could be used by the thousands of nearby residents, the mall would destroy hundreds of nearby "mom-and-pop" businesses, small boutiques and restaurants in surrounding neighborhoods and would introduce significant and possibly devastating competition to existing, struggling malls, such as the beautiful Atlas Park Mall in Glendale and even Queens Center Mall.

Queens Civic Congress and fellow organizations believe that FMCP has been intentionally neglected by the City by providing inadequate maintenance budgets and minimal capital improvements over decades, resulting in a untidy and disorganized park. None-the-less, the Park serves as the backyard to tens of thousands of working class and middle income workers from nearby neighborhoods. The lack of upkeep seems to justify to the city its ability to propose commercial and corporate projects such as a Major League Soccer Stadium, the tennis center and this mall. Despite the terrible condition of the Park, on this Memorial Day there was not a square inch of space available to put down a blanket or park a car.

People with barbeques and badminton, boom boxes and soccer were everywhere enjoying the outdoors space that is not available on their blocks.

If, as the City is proposing, the CitiField parking lots could be repurposed, the space could better be used by the people for additional picnic and recreation space, not for stores and movie theaters that have questionable demand and little or no access. There is no pedestrian traffic nearby to support a mall and residential development plans for Willets Point remain unclear and far in the future.

Queens Civic Congress urges the Borough President to oppose this project unequivocally. Willets Point West is an unjustified, unnecessary and inexcusable abuse of the City's land use powers. We believe that the project is also in violation of parkland alienation regulations and should be reviewed by the State. The justification to avoid these regulations seems to be that a lease agreement provides to a private entity unrestricted use of the land, but we contest that a lease could supersede contradictory parkland alienation legislation.

Borough President Marshall, please continue to make your permanent and lasting mark on Queens by preserving open space at Flushing Meadows Corona Park and just say "No."

Richard C. Hellenbrecht, President

president@qccnyc.org

Queens Community Board 3
on the Willets West mall / Willets Point development

Public hearing and vote held May 23, 2013

Blog post of Willets Point United Inc., including transcription of resolution adopted by CB3:

Queens Community Board 3 nixes Mets mall

By a wide margin of 30-1 (plus 1 abstention), CB3 voted on Thursday night to disapprove the proposed "Willets West" mall / Willets Point development. The landslide vote endorsed the earlier recommendation, on Tuesday night, of several CB3 committees, and took place after a public hearing on the matter. Reasons for CB3's disapproval include the project's huge and unaddressed traffic congestion and related negative impacts, failure to prioritize housing and a school, overcrowding of subway and bus lines as a consequence of the project, and disregarding the Advisory Committee and Queens officials when selecting the plan and the developers. CB3 concluded: "The proposed project would change the character of the surrounding neighborhoods and impact the livelihoods of 250,000 residents and many small mom-and-pop businesses."

Likely aware of the committees' Tuesday recommendation to disapprove the project, no representative of developers Sterling Equities and Related Companies, or the city, bothered to attend the Thursday night public hearing.

Although CB7 voted last week to approve the same development project by a very slim margin of 22-18 (notoriously, after the CB7 committee had rejected it the week before by a vote of 7-2), the city's Uniform Land Use Review Procedure ("ULURP") entitles other affected community boards to also evaluate a land use application that "may significantly affect the welfare of the district or borough served by such board". CB3 has exercised that right, and decided to disapprove the application. So at the moment, the Willets West mall / Willets Point development has been approved by CB7 by a very slim margin, and rejected by CB3 almost unanimously. ULURP does not give any greater weight to any particular community board's recommendation – so both boards' recommendations must be equally considered by the next decision-makers.

Donovan Finn, a former CB3 member and university professor who teaches urban planning, urban policy and environmental design, stated during the public hearing: "There are too many holes in this contract. It is completely designed to make Related and the Wilpons be able to build their mall, build their new parking lot, do a few nice things along the edges of the development, and if they choose – to pay what for them will be a piddly amount of money and walk away. The affordable housing will never get built. ... I'm not a psychic, but that's the future I

see. This is not just a vote against a really bad plan, which it is, I think. Something will happen on that site – It just should be something better; it should be something that whoever builds it should come and ask us what we need, and what we think should be there, instead of just deciding and telling us that it's in our best interest."

The CB3 Chairperson, Marta Lebreton, read the following statement prior to the board's vote on Thursday night:

"I'm going to read the recommendation that was made on Tuesday night. ... ULURP section 203, item (g.), allows for the review and vote on actions not in a community district. Willets Point may be geographically located within Community Board 7, but the proposed action will directly impact more than 250,000 residents in Community Board 3. Our board is merely a couple of blocks from the site, and therefore any and all actions that take place at Willets Point will directly impact the residents of our board.

On Tuesday, May 21, 2013, Community Board 3 convened a joint committee meeting of the business, economic development, parks, land use and traffic/transportation [committees] to review the Willets Point redevelopment project, which includes 'Willets West' [mall] and the Willets Point Special District. After careful review of the proposal, the committee concluded that the plan in its present form be disapproved.

Community Board 3 Queens is opposed to constructing a mall on mapped public parkland; the demolition of the Empire Millwork Corporation building – a historic site listed in the state and national registries; and the proposed development schedule. The plan calls for soil remediation of 23 out of 62 acres of the proposed site, which will be in Phase One of the project. The anticipated completion date would be 2018, when retail and hotel space would be constructed. Affordable housing and the construction of a school would not come until 2028 – ten years later, in Phase 1B. The aforementioned school and housing should be included in the first phase.

The impacts that are not addressed in the current proposal are:

Traffic: Although a commitment was made to provide \$1.87 million to establish an infrastructure and traffic mitigation fund for traffic improvements, there was no mention of how traffic congestion would be mitigated in Community Board 3 Queens, particularly at 114th Street, Astoria Boulevard, 34th Avenue, Roosevelt Avenue and Northern Boulevard.

Transit and pedestrians: Community Board 3 Queens will be impacted by the increase of ridership on the subway line number 7 and the bus lines of Q48, Q66 and Q19.

Public health concerns: Community Board 3 Queens has been identified as one of the districts that has the highest incidence of asthma and other respiratory ailments. The applicants report that the increase in traffic would have no impact on Community Board 3 Queens. The increase in traffic volumes will surely adversely affect our fragile constituents. The committee strongly recommends that a complete environmental cleanup on all the acres in Willets Point be conducted, not just in the Special District. Further, cleanup of Flushing Bay and installation of a new sewer system so that Flushing Bay will no longer remain a dumping ground.

Environmental and social justice: The current plans do not consider our community needs, nor acknowledge the impact the proposed plan will have on the commercial and residential displacement of our most vulnerable residents in Community Board 3 Queens.

In conclusion, the Willets Point proposal – the city's largest development project in this section of Queens: The impacts of this major undertaking will affect not only the residents of Community Board 7, but all of the surrounding board areas. In July, 2008, the Borough President's recommendation approved the application with the condition that the Willets Point Advisory Committee be comprised of the Queens Borough President, local elected officials, representatives from Community Boards 3, 4 and 7, and other community leaders, should be continued for the duration of the project, including during developer selection, construction, implementation and all other phases of the Willets Point development. We strongly suggest that the Borough President's recommendation be complied with. Community Board 3 Queens recommends that the application be disapproved as presented. The proposed project would change the character of the surrounding neighborhoods and impact the livelihoods of 250,000 residents and many small mom-and-pop businesses. That is the recommendation of the committee. Do I have a motion – a motion is on the floor. Do I have a second? Okay. Any discussion? Okay; we're going to call the question. The motion on the floor, seconded by Ed Westley, is to disapprove the application as presented. And we are going to include everything that I read."

A "Yes" vote is for denial.

Vote tally: 30 "Yes" [for denial of the application]; 1 "No"; 1 abstention.

[End.]

Land deal shameful steal

ONLY in Michael Bloomberg's New York are we asked to believe that giving away huge swaths of city-owned land to millionaires is a wonderful deal.

The mayor announced Wednesday that the city had selected the Wilpons, of the Mets and Sterling Equities, and Steve Ross of The Related Companies, to develop 23 acres of land in the Willets Point redevelopment area in Queens.

The Wilpon-Ross partnership, Queens Development Group, will be handed this land completely free of charge, so it can build its own new retail, entertainment and hotel complex adjacent to the Mets' Citi Field.

Yes, free land, even though the city is on track to spend nearly \$500 million buying that very land from scores of industries and auto repair firms that operated there for decades, putting in new sewer lines, and erecting new Long Island Expressway ramps.

Free land, even though

Queens Development has committed to developing only one-third of the entire 60-acre Willets Points project City Council approved back in 2008.

Queens Development won't even have to begin construction on a single unit of residential housing — part of the original lure of the project — until 2025.

"How do you give away 23

acres of land for nothing?" Jerry Antonacci wants to know. He has run Crown Container, a waste hauling and recycling plant in Willets Point for nearly 40 years and has been battling the city's efforts to move him out.

"This is like the biggest heist ever," Antonacci said. "We all knew the Wilpons wanted our land for themselves all along, and now they got it."

But when City Hall originally got Council's approval for Willets Point, there was no mention of giveaways or of the Wilpons as a possible developer.

Just the opposite.

Back then, Bloomberg's aides assured the Council that any

taxpayer money spent on Willets Point would be recouped when the city sold the land to a developer that would be chosen later.

Council was understandably skeptical. For one thing, all previous development projects always had a developer's name attached to them when they came up for vote. This one didn't.

Then there was the big city money upfront for acquiring private land.

On Oct. 17, 2008, for instance, then-Deputy Mayor Robert Lieber was grilled by former City Councilman Hiram Monserrate about the land sales.

"Our goal would be to get the city taxpayer money back out of this," Lieber said.

"In the sale of the properties?" Monserrate asked.

"That's correct," Lieber said.

Lieber conceded that if potential developers claimed the cost of cleaning up the polluted land was too high, the city might agree to "get less for land." He never said anything about free land.

Back then, the city's skin in the game was \$400 million. That has now gone up by another \$80 million to build the LIE ramps for the project.

Back then, the project's

Mets chairman and CEO Fred Wilpon will receive 23 acres of land, free of charge, to redevelop in Willets Point, Queens. Photo by Getty Images

timeline was five to 10 years. It included a convention center, a new school, twice as much housing.

Now, you won't see any housing open for maybe 15 years.

No convention center. No school. And two-thirds of the Willets Point site will remain undeveloped and polluted possibly for decades.

"We are thrilled to have been selected by the City to . . . rejuvenate Willets Points into a stunning, new, mixed-use neighborhood," Jeff Wilpon said as he stood next to Bloomberg.

Sure, they're thrilled. You'd be, too, if you had just been handed 23 acres of land paid for by taxpayers, right next door to your own new baseball stadium.

The Willets Point plan: a bad deal in every way

by Benjamin M. Haber

Good and responsible government does not exist in the absence of transparency, and in particular when it involves land use matters which have been notorious in favoring real estate interests and those with political connections. Years ago Daniel Doctoroff, then Mayor Bloomberg's economic czar, bragged before a group of real estate moguls that under the Bloomberg administration they received about 90 percent of all zoning requests they wanted.

When it comes to transparency the Bloomberg administration earns a failing grade. A case in point is Willets Point. For decades, and most of Mayor Bloomberg's term in office, the city collected sewer rent from the owners of property in Willets Point, notwithstanding there were no sewers. It collected real estate and other taxes and did not spend any money on the area's infrastructure.

A body and fender shop's operations, which for the most part serve the needs of the poor and the middle class, cannot be as spotless as a Bloomingdale's department store, which makes it all the more important government take care of the infrastructure.

As a coverup for his failure in doing so, Bloomberg declared the site a blight that must go, even though it would mean removing more than 200 small businesses, terminating employment for their 1,000 employees and causing havoc to their thousands of dependents. Cleanup of the so-called blight, which the city will pay for for the benefit of a developer, could have been done for Willets Point businesses. But it will not be, since they are not real estate moguls with tentacles in the city treasury.

The cost to correct the area and repair the infrastructure, to alienate parkland, free of charge, and to provide subsidies, will be several hundreds of millions of dollars, all to be paid for by taxpayers for the benefit of a private developer. For Bloomberg to allow this taxpayer ripoff ignores his responsibility to be fair and above-board with the public. It's unacceptable.

It was Bloomberg's original plan to develop Willets Point into a huge shopping mall, with yet another convention center, luxury housing with a small portion of affordable housing for the middle class, a small park and a school. Building a school next door to LaGuardia Airport, the Mets' stadium, the United States Tennis Association and a huge mall would be absurd, a feigned icing on the cake to make it appear the proposal was not a private commercial development but a needed public undertaking.

Willets Point and its surrounding areas

have automobile access only through the Van Wyck Expressway, Grand Central Parkway, Northern Boulevard and Roosevelt Avenue, private streets being out of the question. These arteries have been

and are choked to capacity. Queens was ranked as having one of the most congested vehicular arteries in the country and there is no way — I repeat, no way — to increase their capacity to absorb the tens of thousands of additional vehicles the Bloomberg plan would bring.

Faced with a vehicular nightmare and unable to come up with a solution, Mayor Bloomberg has devised what can be described as the mother of all lack of transparencies. The original Willets Point plan has suddenly been split into two phases. His much-heralded original Willets Point plan is now relegated to phase two, which for all practical purposes will be on the back burner and probably not accomplished for decades.

The reason for the so-called split is not just the vehicular problem, but Bloomberg's desire to help out his billionaire friend Fred Wilpon, the owner of the Mets, who have not been doing well financially. Phase one will allow Wilpon to move his parking lots — which are on parkland, as is Citi Field — to Willets Point and to construct a huge mall on the current Mets parking lots. Parking in Willets Point and the mall will not address the vehicular problem, but will destroy the small businesses on Northern Boulevard, Roosevelt Avenue and 108th Street, the malls in Rego Park and on 20th Avenue in Whitestone, and the shops in downtown Flushing. Were I in business in any of those areas, I would hesitate to sign a long-term lease. Unless these merchants and the public make known to the mayor, their City Council members and community boards their opposition, the mayor's plans will be a fait accompli.

Former President Franklin D. Roosevelt once said he wished to be remembered for what he did for the poor and not for the rich. Notwithstanding some laudable philanthropic acts Bloomberg has accomplished as a private individual, as mayor he has viewed his constituents as the wealthy and powerful and not the poor and middle class. I do not believe he will leave a legacy as noteworthy as that of President Roosevelt.

Benjamin M. Haber is a civic activist and retired attorney who lives in Flushing.

EDC and Shulman's Queens LDC admit illegal lobbying

BY VERA CHINESE
NEW YORK DAILY NEWS

TWO city economic development agencies have admitted to illegally lobbying the City Council to support a plan to overhaul gritty Willets Point.

A three-year probe by the state Attorney General's office confirmed what many property owners in the so-called Iron Triangle had long complained about — that these agencies were exerting undue influence on the Council.

The findings, unveiled Tuesday, found both the city Economic Development Corp. and the Flushing-Willets Point-Corona Local Development Corp. unlawfully lobbied the Council in 2008 to approve the redevelopment.

The investigation extended to the Coney Island Development Corp., which also admitted to soliciting support for a project there.

The agreement between the city EDC, the two other LDCs and the AG validates years of complaints from Willets Point business owners who charged the Flushing-Willets Point-Corona LDC and specifically, its president, Claire Shulman, curried favor for a plan to take properties through eminent domain.

Mayor Bloomberg announced a different plan last month, when he said the city had reached a deal with Sterling Equities and Related Cos. to build a 1 million-square-foot mall on land already owned by the city.

Under state law, "no such corporation shall attempt to influ-

Flushing-Willets Point-Corona Local Development Corp., headed by Claire Shulman, found to have illegally lobbied City Council. Christie M. Farriella

ence legislation by propaganda or otherwise." The law does not list monetary penalties for violations, so the LDCs will not pay fines.

The agreement stipulates that each LDC will not employ out-

side lobbyists, draft testimony for third parties to submit to the Council and directors will have to undergo compliance training.

Members of Willets Point Unit-

been harsher.

"There was a crime committed here," said Willets Point United President Gerald Antonacci. "People ran for the hills when they were threatened with eminent domain. A lot of people who sold their properties would have never have sold it."

Shulman, the former Queens Borough President, could not be reached for comment. Flushing-Willets Point-Corona LDC officials said they were "glad the matter was behind them."

The EDC will also have to restructure, losing its status as an LDC.

LDCs are quasi-city agencies that have the power to buy or lease city land without undergoing the public bidding process.

An EDC spokesman downplayed the ruling, stating the law did not clearly define what constituted lobbying.

"The restructuring should be seamless from the perspective of third parties and should have little to no impact on the day-to-day operations of the company," the spokesman said in a statement.

Some of the transgressions included ghost-writing op-ed pieces, preparing testimony for third parties and providing transportation for supporters at hearings.

"These local development corporations flouted the law by lobbying elected officials, both directly and through third parties, to win approval of their favored projects," Attorney General Eric Schneiderman said.

verachinese@nydailynews.com

**New York City Planning Commissioners Recommended
That EDC Follow the Obvious Precedent:
Relocation of the Fulton Fish Market**

In November, 2005, the entire Fulton Fish Market (the largest consortium of seafood wholesalers in the country; 37 businesses employing 650 workers) was relocated from lower Manhattan to a new facility at Hunts Point in the Bronx.

The example of the relocated Fulton Fish Market as an appropriate model for the City to follow when relocating the Willets Point tenant automotive businesses has been recognized by New York City Planning Commissioners. During the public hearing held by the New York City Planning Commission on August 13, 2008 for the proposed Willets Point Development, the following exchange took place between Commissioners Karen Phillips, Irwin Cantor and Angela Battaglia, and New York City Economic Development Corporation Vice President Jonathan Gouveia:

Commissioner Phillips: "The work that you are doing with the 225 tenant businesses – Are the majority of those tenant businesses in auto-related uses? And my other question was, if there was any effort to identify sites and perhaps – because I know we do have the industrial parks that were set up and the industrial strategy that the Mayor put together a couple of years ago – but in a way of **creating a kind of auto-related center** where they could relocate? Because some of them benefit from co-location."

Jonathan Gouveia / EDC: "Right."

Commissioner Phillips: "Is that something that's been looked at, at all? In terms of the areas that have been set aside for industrial areas?"

Jonathan Gouveia / EDC: "As I mentioned, we haven't gotten into in-depth discussions with the tenants. We've hired, or we're in the process of hiring, a tenant relocation specialist. So this sort of ongoing conversation about what their businesses want, where they want to locate, whether they want to co-locate, will become apparent through that process, which will begin later, or towards the end of the summer; early fall [2008]. In preliminary conversations that we've had, not all businesses want that. So what we're really trying to do is place businesses where they think it makes the most sense for them. We're certainly open to looking at what works for the businesses."

Commissioner Cantor: "Further to the other question, which I think was a great question: **We created new areas for the fish market; we created a new area for the grocery market; so conceptually, would it not be an easier sell if you – if I may – to find an area where these auto-related organizations can go to?** You know, and we know, businesses tend to congregate. They feed off each other."

Jonathan Gouveia / EDC: "Right."

Commissioner Cantor: "Whether it be the fish, whether it be the wholesale grocery, whether it be the diamond district; and your answer did not seem to be positive. It was kind of, 'We'll see what develops'. And I would follow commissioner Phillips, and encourage you guys to try and find an area that can accommodate a large number of these businesses who may wish to continue to feed off each other." . . .

Commissioner Battaglia: "I think the idea of moving all the businesses to one location, or finding a suitable location for many of them, would be probably the way to go. What type of assistance will they be given? Would they be given relocation assistance? Would they be given start-up money to configure their new space?"

The 2008 final report of the New York City Planning Commission concerning the proposed Willets Point development refers to "subsequent assurances from EDC":

"During the CPC public hearing, the Commission raised questions regarding the feasibility of relocating the area's similar and complementary businesses together in another single location. The Commission acknowledges subsequent assurances from EDC that the City will attempt to facilitate such a co-relocation effort, should there be businesses that are both interested in and have the capacity to co-locate." (*Report of the New York City Planning Commission concerning the proposed Willets Point development, ULURP application N 080382 ZRQ; September 24, 2008.*)

Re: **Proposed Willets Point / Willets West development**
CEQR No. 07DME014Q
Comments pertaining to pending ULURP application and DSEIS

Dear City Planning Commissioners and Dr. Kulikowski:

I am writing on behalf of Willets Point United Inc. to supplement my oral and written testimony delivered on July 10, 2013 at the public hearing associated with the Uniform Land Use Review Procedure ("ULURP") and the Draft Supplemental Environmental Impact Statement ("DSEIS") pertaining to the proposed Willets Point / Willets West development, CEQR No. 07DME014Q. The following information addresses certain questions and issues raised by the City Planning Commission ("Commission") during the public hearing on July 10, 2013.

(1.) What is Willets Point United Inc.?

Willets Point United Inc. ("WPU") is a coalition of Willets Point property and business owners, formed in 2008, that wants the City to stop its decades-long deliberate withholding of municipal services from Willets Point which hinders the operation of the existing industrial businesses here; that opposes the redevelopment of Willets Point in the manner being promulgated by the Bloomberg administration, which includes the forcible acquisition of our properties via eminent domain to transfer to other private parties to facilitate a non-essential, speculative, alleged economic development project; and that holds project proponents accountable for disseminating false information to decision-makers and the public, abrogating their written guarantees, and engaging in plainly illegal activity to push this project; among other WPU initiatives. For example:

- WPU discovered that the draft Access Modification Report ("AMR") pertaining to proposed new highway access ramps to and from the Van Wyck Expressway (ramps that are essential to the entire proposed Willets Point development), submitted by the New York City Economic Development Corporation ("NYCEDC") with the intent that it be approved by the New York State Department of Transportation ("NYSDOT") and the Federal Highway Administration ("FHWA"), relied upon traffic presumptions that

differed dramatically from those contained within the Final Generic Environmental Impact Statement ("FGEIS") previously prepared for the proposed Willets Point development. As the *New York Times* reported: "State officials have repeatedly expressed frustration with the city's inability to provide reliable information and the pressure it was placing on them to expedite their analysis, according to a review of hundreds of e-mails involving the Willets Point project that were provided to *The New York Times*" by WPU. (Santos, Fernanda. 2010. E-Mails Show State Officials' Skepticism About Willets Point Project. *New York Times*, August 13; p. A17.) WPU's traffic engineer, Brian Ketcham, formally interceded with both NYSDOT and FHWA, challenging the AMR during two all-agency meetings convened for that purpose and by submitting hundreds of pages of independent expert analysis. Thereafter, NYSDOT and FHWA did not approve the draft AMR, but rejected it; restructured the ramp approval process to require an Environmental Assessment prior to approval of any AMR; and sent NYCEDC back to the drawing board to draft a new AMR, which took two years.

- WPU discovered that former Queens Borough President Claire Shulman and her local development corporation ("LDC") conducted a lengthy, unlawful, unregistered lobbying campaign advocating approval of the proposed Willets Point development. The Office of the City Clerk agreed with WPU, resulting in a then-record penalty of \$59,090.00 imposed upon Shulman's LDC.
- WPU discovered that not only Shulman's LDC, but also the New York City Economic Development Corporation ("NYCEDC"), violated state law by attempting to influence legislation authorizing the proposed Willets Point development – activity that is absolutely prohibited to all local development corporations. Moreover, NYCEDC disbursed City funds totaling \$450,000.00 to Shulman's LDC, then directed unlawful lobbying by Shulman's LDC. The New York Mets, owned by the owners of Sterling Equities (which has since been designated by the City as a developer of Willets Point phase one), also financed Shulman's LDC. The New York State Office of the Attorney General conducted a three-year investigation and ultimately agreed with WPU, declaring in 2012: "These local development corporations flouted the law by lobbying elected officials, both directly and through third parties, to win approval of their favored projects." (<http://www.ag.ny.gov/press-release/ag-schneiderman-ends-illegal-lobbying-nyc-officials-three-local-development>) New York City Comptroller John Liu wrote to Mayor Bloomberg: "Last week your Administration admitted in a settlement with the New York State Attorney General that the New York City Economic Development Corporation (EDC) knowingly and illegally lobbied City Council members about your development agenda. ... I urge you to move swiftly to identify those senior officials from City Hall and the EDC responsible for the flagrant and repeated law-breaking activities, and hold them accountable." (http://www.comptroller.nyc.gov/press/2012_releases/pr12-07-083.shtm) As a consequence of its illegal lobbying for the Willets Point development, NYCEDC has had to cease operating as a local development corporation and has been compelled to restructure as a different type of not-for-profit entity. The 2008 approvals of the proposed Willets Point development – procured in the context of lobbying so illegal that it required the restructuring of NYCEDC to ensure it will never happen again – still

are the bases of the proposed Willets Point phase one / Willets West development being considered now.

- WPU sued the City because of the inadequacy of the environmental review conducted for the proposed Willets Point development. Among other things, WPU alleged that the City could not pursue a phased development pursuant to its *Technical Memorandum for the Willets Point Development Plan FGEIS*, TM004, dated February 11, 2011 ("Technical Memorandum 4"), and that the City instead must prepare a Supplemental Environmental Impact Statement ("SEIS"). In that court proceeding, on July 24, 2012, the City finally stipulated that "the City will not proceed with development in Willets Point under Technical Memorandum 4"; and the City is now taking steps to finalize a Supplemental Environmental Impact Statement, just as WPU had said was necessary.
- WPU again sued the City to challenge its attempted use of eminent domain to forcibly acquire Willets Point phase one properties. In that court proceeding, on May 2, 2012, the City finally stipulated that it "would not proceed under its [eminent domain] Determination and Findings, adopted by the City on May 2, 2011", and abandoned the particular attempt to use eminent domain that was the subject of that court proceeding. The City may still attempt to use eminent domain again in the future to acquire Willets Point properties.

In each of the above instances, when WPU took a position and the relevant facts were properly taken into account, WPU's position was vindicated.

Presently, it is the position of WPU that the proposed Willets Point phase one / Willets West plan of Sterling Equities and Related Companies ("Sterling/Related") is inappropriate and cannot be implemented.

(2.) The Commission must consider that the purpose of the special permit to which the ULURP application pertains is to facilitate the shopping mall, and none other.

At the outset of the public hearing held on July 10, 2013, Commission Chair Amanda Burden stated: "... an important element of the project analyzed in the Draft Supplemental Environmental Impact Statement – the retail development at Willets West on the Citi Field site – is not subject to the land use jurisdiction of the Commission since it is located on parkland. ... Just to make it clear, our purview as City Planning Commission really is on the Willets East part of the project and the temporary interim uses there."

We emphasize that the ULURP application now being considered, which pertains to the prospective use of Willets Point phase one property as a parking lot, has but one purpose: to facilitate the construction of a 1.4 million square foot shopping mall / entertainment center on parkland property. Except for the intent to construct that shopping mall and to relocate the existing parking lot, there would be no pending ULURP application for any special permit to modify the use of Willets Point phase one property. It would be both inappropriate and an abdication of the Commission's responsibilities, for the Commission to narrowly consider just

the parking lot application, while disregarding the specific intended larger effect of that application – the construction of a huge shopping mall on parkland – that will "change the character of the surrounding neighborhoods and impact the livelihoods of 250,000 residents and many small mom-and-pop businesses", as Queens Community Board 3 wrote when it disapproved this application by its vote of 30-1.

The Commission cannot allow the proposed site of the mall – which just happens to be parkland – to circumvent the Commission's responsible analysis of an application that will obviously "change the character of the surrounding neighborhoods and impact the livelihoods of 250,000 residents and many small mom-and-pop businesses". In any other circumstance where an application will "change the character of the surrounding neighborhoods" the Commission certainly would be involved in assessing the potential changes in character, and would necessarily factor them into any decision for or against the application. The Commission's responsibility to the public is to do so here, as well.

WPU and the public-at-large are not the only ones who recognize that this parking lot ULURP application is inseparable from the intent to construct a 1.4 million square foot mall, and that the application must be evaluated in that context. The notice of the public hearing published by Queens Community Board 7 describes this application as: "ULURP APPLICATION #C 130223 ZSQ – To allow for a 1.4 million square foot retail and entertainment development known as 'Willets West'." (See Attachment A.) As the local community board has formally characterized this ULURP application as allowing for the mall (while not even mentioning the modified parking use at Willets Point), the Commission is able to do the same.

Do not permit an end-run around the Commission's planning oversight – which is what this ULURP application aims to do.

(3.) The 1961 amendment to the City's administrative code provides no basis to construct a shopping mall on the parkland at issue.

Since the purpose of the pending ULURP application to allow a parking lot on Willets Point phase one property is to facilitate the construction of a mall on other parkland property, if the construction of that mall is unlawful then there is no legitimate basis for the pending parking lot ULURP application.

Please review the attached letter from attorney Harvey Epstein, Associate Director of the Urban Justice Center, addressed to land use counsel for Sterling/Related (see Attachment B), which sets forth legal reasoning why the 1961 provision of the City's administrative code provides no basis to construct a shopping mall on the parkland at issue, and why the proposed project of Sterling/Related is therefore "fatally flawed".

If the analysis within the Urban Justice Center letter is correct (and we believe it is), then the Commission is being asked to approve a ULURP application to facilitate construction of a mall that is unlawful and cannot occur. The Commission must not approve a ULURP application that is intended to facilitate an unlawful land use that cannot occur.

(4.) Three other developers submitted proposals that kept within the bounds of the Willets Point Special District and did not add any mall on parkland.

In response to the Request for Proposals ("RFP") seeking developers for Willets Point phase one, three respondents other than Sterling/Related submitted proposals to implement development consistent with the provisions of the RFP, within the bounds of the 23-acre phase one site inside the Willets Point Special District. One of those proposals – submitted by Silverstein Properties, Inc. and Taubman Centers, Inc. – even committed "100% of the residential units in Phase 1 to the affordable housing program".

But the City administration rejected all of those proposals, and instead selected the proposal of Sterling/Related – initially a proposal to construct a casino and gaming facility on the parkland property located west of Citi Field beyond the boundaries of the Willets Point Special District, and which included no housing component whatsoever. The Sterling/Related proposal is said to have been modified such that the parkland property where the casino would have been constructed is now designated as the site of a retail mall and entertainment center, and housing is to be constructed within the Special District in the year 2028 (but only if new highway access ramps to and from the Van Wyck Expressway are constructed first – ramps that no one is obligated to construct, and that the project contract specifies the City is not responsible to build). The plan of Sterling/Related also expands the total size of the Willets Point development from 62 acres as approved during 2008, to 108.9 acres as intended now. The Draft SEIS ("DSEIS") explicitly admits this.

The decision to select the plan of Sterling/Related to the exclusion of all others was made by the City administration via a process that violated written guarantees within the Willets Point FGEIS and elsewhere, that the Willets Point Advisory Committee, led by Queens Borough President Helen Marshall, as well as Queens Community Board 7, would participate in and help to guide developer selection. Instead, those Queens entities were completely excluded from the developer selection process. As we now know, the developer selection process was also an opportunity to choose a plan that would not expand the size of the development from 62 acres to 108.9 acres (with associated increased impacts), and that would not sacrifice 30+ acres of Queens' public parkland for use as a retail mall. It is no wonder that the City administration circumvented the promised involvement of Queens entities, and instead dictated the choice of developers.

In the event that the pending ULURP application of Sterling/Related is disapproved, the City can issue a new RFP for development within the Willets Point Special District that does not sacrifice parkland for use as a mall, and that otherwise respects the goals of the Willets Point development as approved in 2008. If the prior RFP responses are any indication, there will be proposals that respect the property boundaries while realizing the goals established in 2008.

Attached is an informative flyer prepared by WPU (see Attachment C) that summarizes the three rejected development proposals. Also attached is a CD-R disc containing the three rejected RFP responses (see Attachment D), so that the Commission may appreciate that Sterling/Related was not the only available choice, and would not be in the future.

(5.) The City and Sterling/Related are deliberately avoiding conducting any environmental tests at this time on Willets Point phase one property.

During the public hearing held on July 10, 2013, Sterling Equities' representative Richard Brown testified: "As soon as we close, we will be in there doing investigative work of all 23 acres, both above grade and below grade. There's been very limited work done at this time – rightly so, because the city has not had possession. We are to be delivered vacant possessions. So whenever that happens, day one, day two, we go in and we start all of our testing."

But the City claims to already own 95 percent of the Willets Point phase one property. Contrary to the misleading testimony of Richard Brown, nothing prevents the City from performing borings, obtaining soil samples, and conducting environmental tests **right now** throughout the 23-acre phase one site. That the City has not done so is very telling.

The City administration spent upwards of \$200 million of taxpayer funds to acquire the Willets Point phase one property, but intends to gift that phase one property to Sterling/Related for the price of \$1 (one dollar). It is bad enough that such a deal is contrary to what City officials told the City Council during 2008: that the City would recoup the cost of acquiring the property, through the sale of the property to the developer. As we understand it, the new rationale for the steeply discounted \$1 price is that the property has "negative value", because it is allegedly contaminated. But with no scientific tests performed, how can the taxpayers be certain that a discount of \$200+ million is actually warranted?

The City and Sterling/Related are deliberately delaying any environmental testing of Willets Point phase one property until after Sterling/Related have closed the property transaction and taken possession of the property. WPU alleges that they are doing so, because (a) if testing was performed now and it determined that the property is not severely contaminated and required little or no remediation, then there would be no justification to transfer the property to Sterling/Related at the sweetheart deal price of \$1, when they should instead pay the going market rate (as the City Council was promised would be the case during 2008); and (b) if testing was performed now and it determined that the property is very severely contaminated, Sterling/Related might conclude that implementing the proposed development is not financially viable – precluding transferring the property to them at all. For those two reasons, the City and Sterling/Related cleverly prefer not to perform any environmental tests at this time, but to delay any tests until after Sterling/Related have taken possession of the property for the price of \$1. That way, no matter what the test results ultimately show, Sterling/Related will possess the property that they covet – even if it can only be paved over for use as a parking lot. But to delay important environmental tests that could be performed now is not in the taxpayers' interest, and constitutes reckless non-planning.

Is the \$1 price justified? Is the proposed remediation and development feasible? Without scientific environmental testing throughout the Willets Point phase one property, it is impossible to answer those key questions. Therefore, the first order of business – before establishing the price of the property, and before transferring ownership of it – must be to perform the environmental tests that are being purposefully delayed until later.

(6.) **Unknown "feasibility" and "effectiveness" of traffic mitigation measures – despite relying completely on them.**

DSEIS chapter 21 describes traffic mitigation measures. It acknowledges that not every traffic impact can be mitigated. In our opinion, the remaining unmitigated impacts are collectively so severe as to make this proposed development inappropriate and unworthy of approval. Even with the most optimistic mitigation measures in place, a number of intersections at major entry points to the proposed development will operate at Level of Service "F" (fail), with delays of between 100 seconds and more than 800 seconds (13 minutes!).

DSEIS chapter 21 also describes circumstances in which very severe traffic impacts caused by the proposed development (described within DSEIS chapter 14) are completely reversed by the recommended hypothetical mitigation. We think it is dangerous to trust this self-serving mitigation report.

First, DSEIS chapter 21 (the mitigation report) quietly states: "The effectiveness and feasibility of proposed mitigation measures will be further assessed between the draft and final SEIS" (page 21-2).

In other words, no one is committing to the "effectiveness" and "feasibility" of the specific mitigation measures that are being touted now to decision-makers, and which so miraculously improve traffic conditions. Rather, a future, final version of the mitigation report may conclude that all or some of the recommended mitigation measures are simply not effective, or even "feasible" – in which case improvements in traffic flow shown in the present mitigation report will **not** occur, and those impacts may instead be unmitigated.

How can anyone rely upon a report that cannot vouch for even the "feasibility" of the alleged solutions that it presents?

How can the report represent that certain mitigations are essential – without knowing if they are even feasible?

Second, per the mitigation report, some of the recommended mitigations are "measures that may call for detailed review by both NYCDOT and NYSDOT and which represent preferred improvements that would benefit the overall traffic network. As discussed above, if these mitigation measures are modified or rejected by the review agencies, significant adverse impacts identified above would be **unmitigated**" (emphasis added; page 21-29).

In other words, achieving the vastly improved traffic flows described in the mitigation report requires measures that NYCDOT and NYSDOT have not yet reviewed or approved, and which they may eventually reject. At the present time, no one can guarantee that any such mitigation measure will actually be implemented.

Please refer to the analysis of WPU's traffic engineer, Brian Ketcham, submitted together with my written testimony at the public hearing held on July 10, 2013, to understand the severity

of the actual traffic impacts of the proposed project. DSEIS chapter 14 also sets forth what the traffic impacts of the proposed project will be, in the event that mitigation measures cannot be implemented or turn out to be ineffective.

(7.) The Commission has bent its rules to accommodate immediate proxy testimony in favor of the proposed development, while enforcing its rules and delaying proxy testimony opposed to the proposed development.

At the public hearing pertaining to the proposed Willets Point development held on August 13, 2008 – during a section of that hearing dedicated to testimony in opposition to the proposed project – the name "Kevin Loyst" was called to testify. In place of Kevin Loyst, a person named Kevin Phillips came to the podium, identified himself, and stated that he was "here to speak on behalf of Kevin Loyst, who's a colleague" who had to depart the hearing after several hours.

Commission Chair Amanda Burden prohibited Kevin Phillips from testifying at that time as a proxy for Kevin Loyst, telling Phillips unambiguously: "You have to sign up on your own. It's a rule, we have to do – You can't substitute for somebody else. Sorry. So if you just sign up on your own. ... Just sign up on a new card. **You have to sign up for yourself. You can't substitute for somebody else.** ... We will definitely call you, later."

Kevin Phillips then left the podium, and the Commission called a different speaker.

We would have expected consistent enforcement of the Commission's rules at the public hearing recently held on July 10, 2013, when – during a section of the hearing dedicated to testimony in favor of the application – the name "Dan Hendrick" was called to testify, and an unidentified person who was not Dan Hendrick came to the podium. The unidentified person stated that he was "actually here on behalf of Dan Hendrick, who is the V.P. for the New York League of Conservation Voters".

Neither Commission Chair Amanda Burden nor any other Commission member stopped this unidentified person from testifying "on behalf of Dan Hendrick", or enforced the Commission's strict rules that "you have to sign up for yourself" and "you can't substitute for somebody else". The unidentified person proceeded to deliver testimony as a proxy for the absent Dan Hendrick, in favor of the application.

The Commission has treated unequally those who would provide proxy testimony opposed to the Willets Point development, versus those who would provide proxy testimony in favor of the Willets Point development. Kevin Phillips, who was opposed, was relegated to filling out a new speaker's card and beginning the long wait to testify, again; whereas the unidentified person who appeared on July 10, 2013, who was in favor of the application, was welcomed and testified immediately.

WPU intends to post video recordings showing the Commission's unequal treatment of the two above-described speakers on our YouTube channel

(<http://www.youtube.com/user/WilletsPoint>) by Monday, July 22, 2013.

The ULURP process must be neutral and devoid of any such bias. It is no less appropriate that a proxy speaker in favor of the Willets Point development be given a special privilege, than it is that the City should fund an unlawful lobbying scheme to influence decision-makers to approve the project. Both of those tactics, and many others, large and small, have been leveraged by powers-that-be against Willets Point property and business owners – and the WPU membership will not tolerate it.

(8.) The application has significant opposition and virtually no public support.

Significantly, during the public hearing held on July 10, 2013, **no one** from the public ever requested that the Commission approve the pending ULURP application so that they may shop at a Willets West mall built on parkland, park their vehicle on Willets Point phase one property, use a golf driving range at Willets Point during the Mets off-season (i.e., during wintertime), or do anything else that is associated with the ill-conceived, unwanted Sterling/Related project. Indeed, there was a very obvious lack of public enthusiasm for this proposed project during the Commission's public hearing.

Testifiers opposed to the Sterling/Related application outnumbered those in favor. And it must be noted that those in favor merely consisted of NYCEDC employees, AKRF employees, developers' attorneys, and one union member. Simply put, there is virtually no public support for the project which the ULURP application would enable.

(9.) The DSEIS relies upon plainly inaccurate "No Action" baseline conditions.

The DSEIS states: "For the purposes of a conservative impact disclosure, this SEIS assumes that the **existing uses on the project site would be maintained** in each of the three No Action scenarios" (emphasis added; page 1-12).

However, that assumption is inaccurate, for at least two reasons:

First, the City intends, and is already taking steps, to evict tenant businesses that operate throughout the Willets Point phase one property. Tenant businesses are receiving telephone calls from representatives of the New York City Department of Housing Preservation and Development, informing the businesses that they will receive written vacate notices after July 22, 2013. That the City is issuing vacate notices even before obtaining any approval from the Commission or from the City Council that would enable the Sterling/Related proposal to proceed, indicates that the City intends that the tenant businesses vacate the phase one site, regardless of whether the pending ULURP application is approved or any development ever occurs.

The City cannot inform tenant businesses that it will evict them, and proceed to do so, while falsely assuming in the DSEIS exactly the opposite – that "existing uses on the project site would be maintained". Rather, the text of the SEIS must reflect the reality of the circumstances

in the Special District, and the intention of the City. If it does not, then the SEIS is inaccurate.

Moreover, the City has not disclosed what will become of the City-owned Willets Point property in the event that the City's proposed Willets Point development does not occur, but it must do so now in order to ensure an accurate SEIS analysis.

Second, the SEIS must account for the likely future effects of the newly-installed sanitary and storm water sewer lines along 126th Street directly adjacent to Willets Point property, which will be complete by the time the SEIS is finalized, or shortly thereafter.

Whereas during 2008 when the FGEIS was prepared no new sewer main lines actually existed at Willets Point, that is not the case now at the time that the SEIS is being prepared. The existence of the long-sought sewer lines is a significant change in background conditions affecting the entire Willets Point site. All "no action" scenarios described in the SEIS must take into account the likelihood that some existing Willets Point property owners will seek to connect to the new sewer main lines, especially as doing so would facilitate the development of their properties which they have consistently said time and again they would do, if sewer lines existed. It is inconceivable that the sewer lines, having been installed, will not be used.

As part of the SEIS analysis, the City must assess what owner-development would likely occur, even "without action" on the part of the City, now that the sewer main lines exist. The conclusion cannot be that "no change" would be made to any portion of the project site, and that "the existing uses on the project site would be maintained". The sewer lines are bound to inspire changes, and the City is responsible for assessing what those changes might be, as part of the SEIS analysis. That analysis should include outreach to all Willets Point private property owners, to discuss whatever intentions they may have to connect to the sewer systems and enhance the uses of their properties beyond those existing today, in the event that the City's proposed Willets Point development does not occur. To presume that nothing about the area will change despite the presence of the long-sought sewer lines, is to severely underestimate the ambition of the private property owners; and guarantees an inaccurate SEIS analysis.

(10.) More tenant businesses are impacted than the Commission has been led to believe.

The public hearing on July 10, 2013 included testimony from representatives of the Sunrise Cooperative, an association of approximately 60 tenant businesses that are seeking to relocate together (co-locate) in a group or groups. It is our understanding that some of those 60 businesses are located within Willets Point but beyond the 23-acre phase one area that would be affected if the present Sterling/Related plan proceeds.

In the recent eminent domain court case pertaining to a first phase of Willets Point property that was substantially similar to the phase one that is presently contemplated, the City's "Response to EDPL Comments" dated May, 2011 acknowledged that 139 auto related businesses in the first phase would be displaced.

Accordingly, it is important to recognize that the majority of tenant businesses to be

displaced by the present plan are **not** members of the Sunrise Cooperative, and that even if all 60 businesses that are Sunrise Cooperative members would be successfully relocated (and there is no indication that they will be), there are still 79 or more other business within the phase one area – in fact, the majority of affected businesses – that would still need to be relocated, and that would **not** be helped by any Sunrise Cooperative plan.

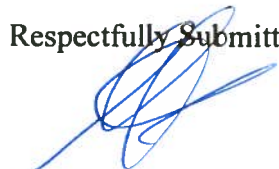

The 79+ businesses that are not members of the Sunrise Cooperative for whatever reason (for example, because they decline to pay the membership dues charged by Sunrise Cooperative) are just as dependent upon co-location for their future survival as are the members of the Sunrise Cooperative. A City administration that is truly interested in preserving businesses, jobs and livelihoods would implement a co-location plan that treats all affected businesses equally, instead of favoring a subset of businesses that have joined a particular group; and would not pretend that other businesses do not also need co-location.

Even as City representatives have told the Commission that the tenant businesses will be relocated, the tenant businesses are receiving telephone calls from representatives of the New York City Department of Housing Preservation and Development, informing the businesses that they will receive written vacate notices after July 22, 2013. At the public hearing held on July 10, 2013, a Commissioner remarked that "we don't understand" why the City would send any such letters now, especially considering that the project for which the property would be needed has not yet been approved. The City presumptively sending vacate notices to tenant businesses indicates a disrespect for the decision-making authority of the Commission and the City Council, and confirms that the City's priority is to see the approximately 139 businesses gone from the phase one site, regardless of whether this application is approved or any development ever occurs.

That is a far cry from the Commission's suggestions, during the 2008 public hearing for the proposed Willets Point development, that the Willets Point businesses should be relocated elsewhere together, as the City did for the Fulton Fish Market businesses and in other cases.

For all of the foregoing reasons, the ULURP application of Sterling/Related is inappropriate and should be denied.

Respectfully Submitted,

Gerald Antonacci
On behalf of Willets Point United Inc.

Re: Willets Point Development ULURP

Jesse and Ross:

We write to you regarding your client's pending ULURP application, which we believe to be fatally flawed. As the site of the potential redevelopment is part of Flushing Meadows Corona Park, it is covered by New York State's public trust doctrine. That doctrine prevents the use of parkland for non-park purposes unless it has been alienated pursuant to an appropriate state statute:

[D]edicated park areas in New York are impressed with a public trust for the benefit of the people of the State. Their use for other than park purposes, either for a period of years or permanent, requires the direct or specific approval of the State Legislature, plainly conferred.

Friends of Van Cortlandt Park v. City of New York, 95 N.Y.2d 623, 631-32 (N.Y. 2001).

The 1961 law which authorized the construction and financing of Shea Stadium on the lot that your client currently is seeking to redevelop, and which supporters of the redevelopment have cited as providing sufficient authority for the plan, does not explicitly allow the alienation of the parkland upon which the stadium was built. NYC Administrative Code 18-118. The statute also does not specifically refer to the alienation of the parkland in question; nor does it provide for replacement parkland or restitution, as do alienation statutes generally. See New York State Office of Parks, Recreation and Historic Preservation, *Handbook on the Alienation and Conversion of Municipal Parkland in New York*, at 27 (revised March 2012). For this reason alone, Administrative Code 18-118 is insufficient to support the proposed project and the state must pass additional legislation before any redevelopment of this land moves forward.

Even if Administrative Code 18-1118 were sufficient legislative action to alienate the Flushing Meadows Corona parkland in question, the statute does not provide specific authorization for the city's contemplated use today: a shopping mall. New York courts have long held that legislative action permitting alienation of parkland and setting forth the permitted uses must be plain and explicit. As the New York Supreme Court Queens County made clear over a half-century ago in *Aldrich v. City of New York*:

It has been held that legislative authority permitting encroachment upon park purposes must be "plainly conferred." (*Williams v. Gallatin*, 229 N.Y. 248, 253.) When speaking of the legislative authority to alienate public parks, language varying only slightly has been used. Some have said that the legislative authority must be "special" others, that such authority must be "specific" ... or "direct" or "express" Add to the foregoing the well-settled rule that "When there is a fair, reasonable and substantial doubt concerning the existence of an alleged power in a municipality, the power should be denied" (*Matter of City of New York [Piers Old Nos. 8-11]*, 228 N.Y. 140, 152), and it seems clear that the legislative authority required to enable a municipality to sell its public parks must be plain.

208 Misc. 930, 939 (N.Y. Sup. Ct., Queens Cty. 1955).

Administrative Code 18-118 *does not* permit the city to sell or lease the parkland at issue to construct a mall, let alone authorize such activity plainly or expressly. Rather, its very title indicates its express intent: "Renting of stadium in Flushing Meadow". In furtherance thereof Subsection 118(b) sets forth two groups of permitted uses for the land. The first states as follows:

(1) for any purpose or purposes which is of such a nature as to furnish to, or foster or promote among, or provide for the benefit of, the people of the city, recreation, entertainment, amusement, education, enlightenment, cultural development or betterment, and improvement of trade and commerce, including professional, amateur and scholastic sports and athletic events, theatrical, musical or other entertainment presentations, and meetings, assemblages, conventions, and exhibitions for any purpose, including meetings assemblages, conventions and exhibitions held for business or trade purposes, and other events of civic, community and general public interest . . .

Subsection (2) states that the land may also be used "for any business or commercial purpose which aids in the financing of the construction and operation of such stadium, grounds, parking" and other permitted uses set forth in subsection (1).

May 14, 2013

Page 3

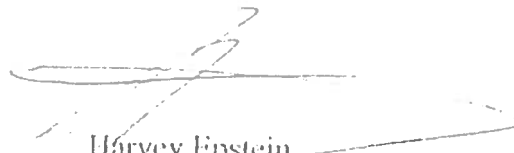

Although a shopping mall is a "business or commercial purpose" contemplated by subsection (2), it has not been proposed that any of the proceeds from the venture would aid in the financing of the other endeavors currently located on the applicable parkland. Indeed, all of the provisions of the 1961 Act addressing financing for Shea Stadium (a stadium, we might add, that no longer exists) are obsolete today. Likewise, the contemplated commercial use does not fall under the more narrow range of uses outlined in subsection (1) of the provision. That subsection requires that any proposed use of the land provide *all* of the following benefits to the "people of the city": "recreation, entertainment, amusement, education, enlightenment, cultural development or betterment, and improvement of trade and commerce." (emphasis added). The legislators undoubtedly could have used the term "or" rather than "and" when walking through the scope of permitted uses, but they choose not to do so.

The mall that has been proposed to fill the Citi Field parking lot does not provide any of the benefits contemplated by the statute, let alone all of them. The only language in subsection (1) that even remotely suggests your client's contemplated use is that which allows uses that "promote" "improvement of trade and commerce." However, that language plainly assumes that the contemplated use would *not* be trade or commerce itself. This assumption is further supported by the long list of explicitly contemplated uses in the subsection, a list which includes "professional, amateur and scholastic sports and athletic events, theatrical, musical or other entertainment presentations, and meetings, assemblages, conventions, and exhibitions for any purpose, including meetings assemblages, conventions and exhibitions held for business or trade purposes." Wholly commercial uses—such as a shopping mall—are absent from the provision.

Further, if the state had intended subsection (1) to cover all forms of trade and commerce, such as a shopping mall, it easily could have included the phrase "any business or commercial purpose" in that subsection, as it did in subsection (2). To read the two differently-worded phrases as permitting the same range of activities, however, would essentially be to make subsection (2) entirely superfluous. Norms of statutory construction prevent such a result. *See, e.g., Cohen v. Lord, Day & Lord*, 75 N.Y.2d 95, 100 (N.Y. 1989) ("Words are not to be rejected as superfluous where it is practicable to give each a distinct and separate meaning."). Therefore, there is simply no basis to read the phrase "improvement of trade and commerce" to cover the contemplated shopping mall.

In light of the above arguments, we are confident that the ULURP, as presented jointly by your client and the EDC, would not withstand judicial scrutiny. Accordingly, we urge you not to attempt to move forward as currently contemplated.

Sincerely yours,

Harvey Epstein
Associate Director

Attachment C

**DEVELOP WILLETS POINT,
WITHOUT ADDING A HUGE MALL ON 30+ ACRES OF PARKLAND,
AND WITHOUT EXPANDING THE DEVELOPMENT FROM 62 TO 108.9 ACRES?
THAT'S EXACTLY WHAT THREE OTHER DEVELOPER FIRMS PROPOSED TO DO!**

**THE CITY REJECTED THOSE PROPOSALS –
IN A SELECTION PROCESS THAT SHUT OUT CB7,
DESPITE PROMISING CB7 IN WRITING THAT IT WOULD PARTICIPATE.**

Sterling/Related, and their expanded plan which adds the 1.4 million square foot
"Willets West" mall on parkland, were designated by the City administration.

Here are the three proposals that required no parkland mall and no expansion of the project –
and which CB7 was denied the opportunity to participate in evaluating:

Macerich

Features:

- "A True Retail Destination"
- Food & Beverage
- Entertainment
- Housing
- Hotel
- Public Open Space
- Parking
- "A Model Green Community"

Silverstein Properties, Inc. and Taubman Centers, Inc.

Features:

- "Entertainment Corridor & Urban Room"
- 126th Street Retail
- Restaurant Row
- Neighborhood Retail Street
- Eco-Promenade
- 100 percent affordable housing (400 units)
- "A Model Sustainable Community"

TDC Development and Construction Corp.

Features:

- "World Trade Center Queens"
- Hotel
- Restaurant
- Trade Mart
- Convention Center
- Retail Complex
- Entertainment District
- Office Building
- Neighborhood Park

Among the reasons given for rejecting those proposals:

- "Would have required public subsidies." – And yet, Sterling/Related are set to receive public subsidies worth nearly half a billion dollars: 23 acres of Willets Point Phase One property, worth more than \$200 million, for the price of just \$1; a capital grant in the amount of \$99 million to cover numerous project costs, including remediation; and \$20 million in sales tax exemption.
- "Would have required rezoning." – Really? Perhaps rezoning the Willets Point Phase One property would have been preferable to expanding the project to 108.9 acres and adding a 1.4 million square foot mall to be constructed on parkland, with increased traffic impacts. Had CB7 been allowed to participate in developer selection as was promised, it could have expressed a preference to proceed with rezoning instead of expanding the project and sacrificing parkland to include a huge mall, with its untenable traffic impacts.

Development of Willets Point need not depend on constructing a mall on 30+ acres of public parkland, and need not expand beyond the boundaries of the 62-acre Special District established in 2008.

Deny the present application of Sterling/Related. Make the City publish a new Request for Proposals, and insist that the City fulfill its written commitments to include CB7 in the developer selection process. In that way, CB7 can do its part to ensure that proposals of all developers – not just those who have special access to property beyond the boundaries specified within an RFP – are fairly considered.

Attachment D

The commenter attached the developer Request for Proposals responses as Attachment D.

CEQR No. 07DME014Q
Comments pertaining to DSEIS

Dear Dr. Kulikowski:

Attached hereto please find the following materials, all of which constitute and are hereby submitted to you as comments on the above-referenced Draft Supplemental Environmental Impact Statement pertaining to the proposed Willets Point / Willets West development:

- Testimony, comments and attachments thereto originally submitted to the New York City Planning Commission during the public hearing that you attended on July 10, 2013, including a 12 page report on the topic of traffic authored by Brian T. Ketcham, P.E. and its associated exhibits;
- Supplemental written testimony and attachments thereto dated July 19, 2013.

Respectfully Submitted,

A handwritten signature in black ink, appearing to be "G. Antonacci", written over a horizontal line.

Gerald Antonacci
On behalf of Willets Point United Inc.

Testimony of Gerald Antonacci
at public hearing of City Planning Commission
re: proposed Willets West mall / Willets Point development
July 10, 2013

Hello. I'm Gerald Antonacci, the owner of Crown Container Company and a member of Willets Point United.

Let's get one thing straight: The ONLY reason there's an application to put a parking lot at Willets Point, is to accommodate building a 1.4 million square foot shopping mall on parkland located next to Citi Field. The effect of this application – if approved – is to allow that mall to be built.

At the review session on Monday, a commissioner mentioned that perhaps Sterling and Related need the profits from the mall, to pay the cost of remediation at Willets Point. That is totally incorrect, because there is a \$99 million dollar grant of taxpayer funds to Sterling and Related that they will use to pay for remediation. Make no mistake: Any profits from the mall go straight to Sterling and Related, and remediation does NOT depend on the mall because WE are paying for it.

The entire proposal of Sterling and Related is a bad idea for the following reasons:

UNNECESSARY MALL IS PRIORITIZED

We don't need any shopping mall at that location. If one is built, it will destroy existing shopping districts in Corona and Jackson Heights.

PARKLAND SACRIFICE: 30+ ACRES

Building a shopping mall on public parkland is not appropriate.

TRAFFIC NIGHTMARE

Even with the hypothetical mitigation measures in place, there will be very severe traffic impacts – including gridlock conditions at local intersections. From the developer's own mitigation report (DSEIS chapter 21): Delays of 821 seconds, 273 seconds and 226 seconds – even WITH the most optimistic mitigation measures in place.

Meanwhile, the report does not even guarantee the "feasibility" or "effectiveness" of the recommended mitigation measures – but proceeds to rely on them.

Back in 2008, the City Planning Commission's report noted that the city would "monitor" traffic impacts of this development. But when people are frozen at intersections during the project's 821 second delays, what difference will it make if the city is "monitoring" those delays? At what point, as city planners, do you wake up and say, "This will not work?"

For more detailed information, see the report of engineer Brian Ketcham that is attached to this testimony.

NO VAN WYCK EXPRESSWAY RAMPS

Despite all the talk about new access ramps to and from the Van Wyck Expressway, the project contract specifies that, "for the avoidance of doubt, in no event shall EDC or the City be required to construct the Ramps as part of the development". And without those ramps, ONLY Phase 1A (essentially, the mall) can be built.

NO HOUSING

Housing and affordable housing were touted as the linchpins of this project during 2008. But their construction is being delayed until the year 2025, while the mall is prioritized instead. There's also a contractual "out" clause, allowing Sterling/Related to pay a "cost-of-doing-business" penalty and then build NO housing. In addition, NO housing can be built unless the Van Wyck ramps are built first – but no one is obligated to build the ramps. The developers and the city have deliberately structured their contract to prioritize the mall, while delaying the housing and not ensuring that the ramps – which are prerequisites for the housing – will ever be built. That is tantamount to eliminating the housing.

COSTS SHIFTED TO TAXPAYERS

Contrary to what the City Council was told during 2008, the city will not recoup the value of the Willets Point Phase One property – in excess of \$200 million – but instead, will give it to Sterling/Related for the price of \$1 (one dollar). Also contrary to what the City Council was told, remediation and other costs will not be paid by the developers, but by the taxpayers – as Sterling/Related will receive a \$99 million grant of taxpayer funds, to cover their development costs.

REMEDATION CHARADE

Several weeks ago at community board 7, Sterling/Related and the city were challenged to produce any scientific reports proving the existence of alleged hazardous contamination at Willets Point. Given that the city claims to own over 90 percent of Phase One property, the city is certainly able to conduct tests on that land. Not only did Sterling/Related and the city not produce any such report, but for several years the city has rented Phase One properties to scores of tenant businesses – which the city could not do, if the area was actually hazardous to anyone. Significantly, Dr. James Cervino – a geochemist who is affiliated with the Woods Hole Oceanographic Institution and is also Chair of the CB7 environmental committee – voted to DENY this Willets West mall / Willets Point development application. If there really was an urgent need to remediate any hazardous contamination at Willets Point, a scientist such as Dr. Cervino would be expected to have approved this application instead of rejecting it.

EMINENT DOMAIN ABUSED FOR PRIVATE ENRICHMENT

43 states other than New York have enacted laws to prohibit or curtail the use of eminent domain for economic development. Last year, the U.S. House of Representatives passed a bill that would cancel federal economic development funds to any state where eminent domain is used for economic development. The rest of the country and Congress have sided with property owners on this, and it is Mayor Bloomberg and the city administration that are out on a limb and using inappropriate, un-American tactics for this project.

Is it any wonder that there is strong public opposition to this application?

The Queens Civic Congress, an umbrella group representing more than 100 Queens civic organizations, has issued a letter opposing this application.

Queens Community Board 7 initially DENIED this application in its committee by a vote of 7-2, then the full board later approved it by a narrow margin of 22-18 only after arm-twisting by the city.

Community Board 3 also held a public hearing and voted pursuant to ULURP, with a near-unanimous vote of 31-1 to DENY this application. They do not want the mall on parkland, and they reject the developers' claim that a mall will not impact existing shopping districts.

Please reject this application. Let the city issue a new RFP, and let the respondents conform to the parameters and goals of the project that was approved during 2008.

Finally, please use your own judgment and conscience to decide this application – not favoritism to Mayor Bloomberg or anyone else who appointed you to the Commission.

**“For the avoidance of doubt,
in no event shall EDC or the
City be required to construct
the Ramps as part of the
Development.”**

– Contract Section 3.3

APPROVE THIS PROJECT ???

- ✓ **Unnecessary Mall Prioritized**
- ✓ **Parkland Sacrifice: 30+ acres**
- ✓ **Traffic Nightmare**
- ✓ **No Van Wyck Expressway Ramps**
- ✓ **No Housing**
- ✓ **Clever Contractual “Out” Clauses**
- ✓ **Costs Shifted to Taxpayers**
 - ✓ **PROPERTY GIVE-AWAY: 23 ACRES FOR \$1**
 - ✓ **\$99 MILLION GRANT TO STERLING/RELATED**
- ✓ **Remediation Charade**
- ✓ **Eminent Domain Abused for Private Enrichment**

Queens Civic Congress

Testimony Concerning Proposed Willets Point West Mall at Flushing Meadows Corona Park

June 6, 2013

The Queens Civic Congress is an umbrella organization consisting of over 100 civic associations throughout Queens. The Congress has been active with the Flushing Meadows Corona Park Conservancy, the Fairness Coalition of Queens, and Save Flushing Meadows Corona Park over the past several months. The Congress has in the past and remains adamantly opposed to any further commercial development in the Park. The Queens Civic Congress Platform, entitled Civic 2030, adopted and endorsed by the full Congress in 2008 and ratified by resolution in December 2012, includes the following statements:

15. Support the Flushing Meadows Corona Park Conservancy.
16. Protect Flushing Meadows Corona Park from any further commercial and corporate exploitation.
17. Impose a moratorium on all new construction/development of non-public-benefit projects in Flushing Meadows Corona Park pending completion of a Master Plan by a Commission that has public members.

Flushing Meadows Corona Park is the largest park in Queens and ought to serve as the flagship park in Queens, but instead has become the dumping ground of last resort for placing any project that no other area will accept. While we gladly accept the long standing cultural facilities such as the Queens Museum and Theater and Hall of Science and Zoo, the more recent move of the US Tennis Center and US Tennis Open to the park and its recent expansion has been a serious encroachment on precious parkland that could and should be enjoyed by residents of Queens. CitiField has taken additional acres of public land on a deal that benefits only the Mets owners with very little direct financial benefit to the City and no benefit to Queens or to the Park. The parking lots surrounding the stadium sit on parkland and any change in use should be subject to alienation requirements. As parking lots they could be easily removed and returned to public use.

But the introduction of a massive steel and concrete, brick and mortar mall to these western parking lots would permanently destroy what the community should enjoy as a public park amenity. In addition to removing forever land that could be used by the thousands of nearby residents, the mall would destroy hundreds of nearby "mom-and-pop" businesses, small boutiques and restaurants in surrounding neighborhoods and would introduce significant and possibly devastating competition to existing, struggling malls, such as the beautiful Atlas Park Mall in Glendale and even Queens Center Mall.

Queens Civic Congress and fellow organizations believe that FMCP has been intentionally neglected by the City by providing inadequate maintenance budgets and minimal capital improvements over decades, resulting in a untidy and disorganized park. None-the-less, the Park serves as the backyard to tens of thousands of working class and middle income workers from nearby neighborhoods. The lack of upkeep seems to justify to the city its ability to propose commercial and corporate projects such as a Major League Soccer Stadium, the tennis center and this mall. Despite the terrible condition of the Park, on this Memorial Day there was not a square inch of space available to put down a blanket or park a car.

People with barbeques and badminton, boom boxes and soccer were everywhere enjoying the outdoors space that is not available on their blocks.

If, as the City is proposing, the CitiField parking lots could be repurposed, the space could better be used by the people for additional picnic and recreation space, not for stores and movie theaters that have questionable demand and little or no access. There is no pedestrian traffic nearby to support a mall and residential development plans for Willets Point remain unclear and far in the future.

Queens Civic Congress urges the Borough President to oppose this project unequivocally. Willets Point West is an unjustified, unnecessary and inexcusable abuse of the City's land use powers. We believe that the project is also in violation of parkland alienation regulations and should be reviewed by the State. The justification to avoid these regulations seems to be that a lease agreement provides to a private entity unrestricted use of the land, but we contest that a lease could supersede contradictory parkland alienation legislation.

Borough President Marshall, please continue to make your permanent and lasting mark on Queens by preserving open space at Flushing Meadows Corona Park and just say "No."

Richard C. Hellenbrecht, President

president@gccnyc.org

Queens Community Board 3
on the Willets West mall / Willets Point development

Public hearing and vote held May 23, 2013

Blog post of Willets Point United Inc., including transcription of resolution adopted by CB3:

Queens Community Board 3 nixes Mets mall

By a wide margin of 30-1 (plus 1 abstention), CB3 voted on Thursday night to disapprove the proposed "Willets West" mall / Willets Point development. The landslide vote endorsed the earlier recommendation, on Tuesday night, of several CB3 committees, and took place after a public hearing on the matter. Reasons for CB3's disapproval include the project's huge and unaddressed traffic congestion and related negative impacts, failure to prioritize housing and a school, overcrowding of subway and bus lines as a consequence of the project, and disregarding the Advisory Committee and Queens officials when selecting the plan and the developers. CB3 concluded: "The proposed project would change the character of the surrounding neighborhoods and impact the livelihoods of 250,000 residents and many small mom-and-pop businesses."

Likely aware of the committees' Tuesday recommendation to disapprove the project, no representative of developers Sterling Equities and Related Companies, or the city, bothered to attend the Thursday night public hearing.

Although CB7 voted last week to approve the same development project by a very slim margin of 22-18 (notoriously, after the CB7 committee had rejected it the week before by a vote of 7-2), the city's Uniform Land Use Review Procedure ("ULURP") entitles other affected community boards to also evaluate a land use application that "may significantly affect the welfare of the district or borough served by such board". CB3 has exercised that right, and decided to disapprove the application. So at the moment, the Willets West mall / Willets Point development has been approved by CB7 by a very slim margin, and rejected by CB3 almost unanimously. ULURP does not give any greater weight to any particular community board's recommendation – so both boards' recommendations must be equally considered by the next decision-makers.

Donovan Finn, a former CB3 member and university professor who teaches urban planning, urban policy and environmental design, stated during the public hearing: "There are too many holes in this contract. It is completely designed to make Related and the Wilpons be able to build their mall, build their new parking lot, do a few nice things along the edges of the development, and if they choose – to pay what for them will be a piddly amount of money and walk away. The affordable housing will never get built. ... I'm not a psychic, but that's the future I

see. This is not just a vote against a really bad plan, which it is, I think. Something will happen on that site – It just should be something better; it should be something that whoever builds it should come and ask us what we need, and what we think should be there, instead of just deciding and telling us that it's in our best interest."

The CB3 Chairperson, Marta Lebreton, read the following statement prior to the board's vote on Thursday night:

"I'm going to read the recommendation that was made on Tuesday night. ... ULURP section 203, item (g.), allows for the review and vote on actions not in a community district. Willets Point may be geographically located within Community Board 7, but the proposed action will directly impact more than 250,000 residents in Community Board 3. Our board is merely a couple of blocks from the site, and therefore any and all actions that take place at Willets Point will directly impact the residents of our board.

On Tuesday, May 21, 2013, Community Board 3 convened a joint committee meeting of the business, economic development, parks, land use and traffic/transportation [committees] to review the Willets Point redevelopment project, which includes 'Willets West' [mall] and the Willets Point Special District. After careful review of the proposal, the committee concluded that the plan in its present form be disapproved.

Community Board 3 Queens is opposed to constructing a mall on mapped public parkland; the demolition of the Empire Millwork Corporation building – a historic site listed in the state and national registries; and the proposed development schedule. The plan calls for soil remediation of 23 out of 62 acres of the proposed site, which will be in Phase One of the project. The anticipated completion date would be 2018, when retail and hotel space would be constructed. Affordable housing and the construction of a school would not come until 2028 – ten years later, in Phase 1B. The aforementioned school and housing should be included in the first phase.

The impacts that are not addressed in the current proposal are:

Traffic: Although a commitment was made to provide \$1.87 million to establish an infrastructure and traffic mitigation fund for traffic improvements, there was no mention of how traffic congestion would be mitigated in Community Board 3 Queens, particularly at 114th Street, Astoria Boulevard, 34th Avenue, Roosevelt Avenue and Northern Boulevard.

Transit and pedestrians: Community Board 3 Queens will be impacted by the increase of ridership on the subway line number 7 and the bus lines of Q48, Q66 and Q19.

Public health concerns: Community Board 3 Queens has been identified as one of the districts that has the highest incidence of asthma and other respiratory ailments. The applicants report that the increase in traffic would have no impact on Community Board 3 Queens. The increase in traffic volumes will surely adversely affect our fragile constituents. The committee strongly recommends that a complete environmental cleanup on all the acres in Willets Point be conducted, not just in the Special District. Further, cleanup of Flushing Bay and installation of a new sewer system so that Flushing Bay will no longer remain a dumping ground.

Environmental and social justice: The current plans do not consider our community needs, nor acknowledge the impact the proposed plan will have on the commercial and residential displacement of our most vulnerable residents in Community Board 3 Queens.

In conclusion, the Willets Point proposal – the city's largest development project in this section of Queens: The impacts of this major undertaking will affect not only the residents of Community Board 7, but all of the surrounding board areas. In July, 2008, the Borough President's recommendation approved the application with the condition that the Willets Point Advisory Committee be comprised of the Queens Borough President, local elected officials, representatives from Community Boards 3, 4 and 7, and other community leaders, should be continued for the duration of the project, including during developer selection, construction, implementation and all other phases of the Willets Point development. We strongly suggest that the Borough President's recommendation be complied with. Community Board 3 Queens recommends that the application be disapproved as presented. The proposed project would change the character of the surrounding neighborhoods and impact the livelihoods of 250,000 residents and many small mom-and-pop businesses. That is the recommendation of the committee. Do I have a motion – a motion is on the floor. Do I have a second? Okay. Any discussion? Okay; we're going to call the question. The motion on the floor, seconded by Ed Westley, is to disapprove the application as presented. And we are going to include everything that I read."

A "Yes" vote is for denial.

Vote tally: 30 "Yes" [for denial of the application]; 1 "No"; 1 abstention.

[End.]

Land deal shameful steal

ONLY in Michael Bloomberg's New York are we asked to believe that giving away huge swaths of city-owned land to millionaires is a wonderful deal.

The mayor announced Wednesday that the city had selected the Wilpons, of the Mets and Sterling Equities, and Steve

Ross of The Related Companies, to develop 23 acres of land in the Willets Point redevelopment area in Queens.

The Wilpon-Ross partnership, Queens Development Group, will be handed this land completely free of charge, so it can build its own new retail, entertainment and hotel complex adjacent to the Mets' Citi Field.

Yes, free land, even though the city is on track to spend nearly \$500 million buying that very land from scores of industries and auto repair firms that operated there for decades, putting in new sewer lines, and erecting new Long Island Expressway ramps. Freeland, even though

Queens Development has committed to developing only one-third of the entire 60-acre Willets Point project City Council approved back in 2008.

Queens Development won't even have to begin construction on a single unit of residential housing — part of the original lure of the project — until 2025.

"How do you give away 23

acres of land for nothing?"

Jerry Antonacci wants to know. He has run Crown Container, a waste hauling and recycling plant in Willets Point for nearly

40 years and has been battling the city's efforts to move him out.

"This is like the biggest heist ever," Antonacci said. "We all knew the Wilpons wanted our land for themselves all along, and now they got it."

But when City Hall originally got Council's approval for Willets Point, there was no mention of giveaways or of the Wilpons as a possible developer.

Just the opposite.

Back then, Bloomberg's aides assured the Council that any

taxpayer money spent on Willets Point would be recouped when the city sold the land to a developer that would be chosen later.

Council was understandably skeptical. For one thing, all previous development projects always had a developer's name attached to them when they came up for vote. This one didn't.

Then there was the big city money upfront for acquiring private land.

On Oct. 17, 2008, for instance, then-Deputy Mayor Robert Lieber was grilled by former City Councilman Hiram Monserrate about the land sales.

"Our goal would be to get the city taxpayer money back out of this," Lieber said.

"In the sale of the properties?" Monserrate asked.

"That's correct," Lieber said.

Lieber conceded that if potential developers claimed the cost of cleaning up the polluted land was too high, the city might agree to "get less for land." He never said anything about free land.

Back then, the city's skin in the game was \$400 million. That has now gone up by another \$80 million to build the LIE ramps for the project.

Back then, the project's

Mets chairman and CEO Fred Wilpon will receive 23 acres of land, free of charge, to redevelop in Willets Point, Queens. Photo by Getty Images

timeline was five to 10 years. It included a convention center, a new school, twice as much housing.

Now, you won't see any housing open for maybe 15 years.

No convention center. No school. And two-thirds of the Willets Point site will remain undeveloped and polluted possibly for decades.

"We are thrilled to have been selected by the City to . . . rejuvenate Willets Points into a stunning, new, mixed-use neighborhood," Jeff Wilpon said as he stood next to Bloomberg.

Sure, they're thrilled. You'd be, too, if you had just been handed 23 acres of land paid for by taxpayers, right next door to your own new baseball stadium.

jgonzalez@nydailynews.com

The Willets Point plan: a bad deal in every way

by Benjamin M. Haber

Good and responsible government does not exist in the absence of transparency, and in particular when it involves land use matters which have been notorious in favoring real estate interests and those with political connections. Years ago Daniel Doctoroff, then Mayor Bloomberg's economic czar, bragged before a group of real estate moguls that under the Bloomberg administration they received about 90 percent of all zoning requests they wanted.

When it comes to transparency the Bloomberg administration earns a failing grade. A case in point is Willets Point. For decades, and most of Mayor Bloomberg's term in office, the city collected sewer rent from the owners of property in Willets Point, notwithstanding there were no sewers. It collected real estate and other taxes and did not spend any money on the area's infrastructure.

A body and fender shop's operations, which for the most part serve the needs of the poor and the middle class, cannot be as spotless as a Bloomingdale's department store, which makes it all the more important government take care of the infrastructure.

As a coverup for his failure in doing so, Bloomberg declared the site a blight that must go, even though it would mean removing more than 200 small businesses, terminating employment for their 1,000 employees and causing havoc to their thousands of dependents. Cleanup of the so-called blight, which the city will pay for, for the benefit of a developer, could have been done for Willets Point businesses. But it will not be, since they are not real estate moguls with tentacles in the city treasury.

The cost to correct the area and repair the infrastructure, to alienate parkland, free of charge, and to provide subsidies, will be several hundreds of millions of dollars, all to be paid for by taxpayers for the benefit of a private developer. For Bloomberg to allow this taxpayer ripoff ignores his responsibility to be fair and above-board with the public. It's unacceptable.

It was Bloomberg's original plan to develop Willets Point into a huge shopping mall, with yet another convention center; luxury housing with a small portion of affordable housing for the middle class; a small park and a school. Building a school next door to LaGuardia Airport, the Mets' stadium, the United States Tennis Association and a huge mall would be absurd, a feigned icing on the cake to make it appear the proposal was not a private commercial development, but a needed public undertaking.

Willets Point and its surrounding areas

have automobile access only through the Van Wyck Expressway, Grand Central Parkway, Northern Boulevard and Roosevelt Avenue, private streets being out of the question. These arteries have been and are choked to capacity. Queens was ranked as having one of the most congested vehicular arteries in the country and there is no way — I repeat, no way — to increase their capacity to absorb the tens of thousands of additional vehicles the Bloomberg plan would bring.

Faced with a vehicular nightmare and unable to come up with a solution, Mayor Bloomberg has devised what can be described as the mother of all lack of transparencies. The original Willets Point plan has suddenly been split into two phases. His much-heralded original Willets Point plan is now relegated to phase two, which for all practical purposes will be on the back burner and probably not accomplished for decades.

The reason for the so-called split is not just the vehicular problem, but Bloomberg's desire to help out his billionaire friend Fred Wilpon, the owner of the Mets, who have not been doing well financially. Phase one will allow Wilpon to move his parking lots — which are on parkland, as is Citi Field — to Willets Point and to construct a huge mall on the current Mets parking lots. Parking in Willets Point and the mall will not address the vehicular problem, but will destroy the small businesses on Northern Boulevard, Roosevelt Avenue and 108th Street, the malls in Rego Park and on 20th Avenue in Whitestone, and the shops in downtown Flushing. Were I in business in any of those areas, I would hesitate to sign a long-term lease. Unless these merchants and the public make known to the mayor, their City Council members and community boards their opposition, the mayor's plans will be a fait accompli.

Former President Franklin D. Roosevelt once said he wished to be remembered for what he did for the poor and not for the rich. Notwithstanding some laudable philanthropic acts Bloomberg has accomplished as a private individual, as mayor he has viewed his constituents as the wealthy and powerful and not the poor and middle class. I do not believe he will leave a legacy as noteworthy as that of President Roosevelt.

Benjamin M. Haber is a civic activist and retired attorney who lives in Flushing.

EDC and Shulman's Queens LDC admit illegal lobbying

BY VERA CHINESE
NEW YORK DAILY NEWS

TWO city economic development agencies have admitted to illegally lobbying the City Council to support a plan to overhaul gritty Willets Point.

A three-year probe by the state Attorney General's office confirmed what many property owners in the so-called Iron Triangle had long complained about — that these agencies were exerting undue influence on the Council.

The findings, unveiled Tuesday, found both the city Economic Development Corp. and the Flushing-Willets Point-Corona Local Development Corp. unlawfully lobbied the Council in 2008 to approve the redevelopment.

The investigation extended to the Coney Island Development Corp., which also admitted to soliciting support for a project there.

The agreement between the city EDC, the two other LDCs and the AG validates years of complaints from Willets Point business owners who charged the Flushing-Willets Point-Corona LDC and specifically, its president, Claire Shulman, curried favor for a plan to take properties through eminent domain.

Mayor Bloomberg announced a different plan last month, when he said the city had reached a deal with Sterling Equities and Related Cos. to build a 1 million-square-foot mall on land already owned by the city.

Under state law, "no such corporation shall attempt to influ-

Flushing-Willets Point-Corona Local Development Corp., headed by Claire Shulman, found to have illegally lobbied City Council. Christie M. Farriella

ence legislation by propaganda or otherwise." The law does not list monetary penalties for violations, so the LDCs will not pay fines.

The agreement stipulates that each LDC will not employ out-

side lobbyists, draft testimony for third parties to submit to the Council and directors will have to undergo compliance training.

Members of Willets Point Unit-

been harsher.

"There was a crime committed here," said Willets Point United President Gerald Antonacci. "People ran for the hills when they were threatened with eminent domain. A lot of people who sold their properties would have never have sold it."

Shulman, the former Queens Borough President, could not be reached for comment. Flushing-Willets Point-Corona LDC officials said they were "glad the matter was behind them."

The EDC will also have to restructure, losing its status as an LDC.

LDCs are quasi-city agencies that have the power to buy or lease city land without undergoing the public bidding process.

An EDC spokesman downplayed the ruling, stating the law did not clearly define what constituted lobbying.

"The restructuring should be seamless from the perspective of third parties and should have little to no impact on the day-to-day operations of the company," the spokesman said in a statement.

Some of the transgressions included ghost-writing op-ed pieces, preparing testimony for third parties and providing transportation for supporters at hearings.

"These local development corporations flouted the law by lobbying elected officials, both directly and through third parties, to win approval of their favored projects," Attorney General Eric Schneiderman said.

verachinese@nydailynews.com

BRIAN KETCHAM ENGINEERING, PC

175 Pacific Street, Brooklyn, NY 11201, 718-330-0550, bfk@konheimketcham.com

Submission by Brian T. Ketcham, P.E., July 10, 2013
to the City Planning Commission regarding the evaluation of the Willets “West” Mall/Willets
Point Development Plan

I am a transportation and environmental engineer. For the last four years I have been assisting Willets Point United in discovering the truth about this project. It is these analyses and the lies we uncovered that have delayed this project for more than three years.

I am writing to encourage the New York City Planning Commission to reject this project. There are good reasons for doing so:

1. NYCEDC claims that by adding the Willets “West” Mall they will actually reduce traffic congestion—this is a preposterous claim; the Willets “West” Mall will make traffic congestion far more severe than what was reported in the WP FGEIS.
2. The plan is too big for the area; Willets Point is surrounded by what are already the nation’s most congested expressways; the Willets “West” Mall/Willets Point Project will only make condition’s worse.
3. Project impacts reported in the SDEIS are extremely severe and it is unlikely many can be mitigated.
4. Mitigation for expressways is not described in the SDEIS; major changes to expressways take years and require their own individual engineering and environmental assessments delaying project implementation.
5. Proposed mitigation still leaves intersections and expressways gridlocked; this is especially true for Astoria Blvd., Northern Blvd. and Roosevelt Avenue.
6. The SDEIS low balls the number of trips this project will generate; a great deal more traffic will in fact be produced than reported further gridlocking the area.
7. For example, the SDEIS reports that less than 60% of shoppers will use autos to access the site; today 85% of Queens’s shopping trips are by auto; 95% of shoppers to large malls arrive by auto; for destination retail the SDEIS under reports auto trips by 50%.
8. Destination retail would be responsible for more than half of total trips reported for this project; there is no justification for nearly 2 million square feet of new destination retail in the Willets Point area.
9. The project proposes relatively little parking for the size of the project; proposed parking cannot accommodate parking demand; spillover traffic will intensify gridlock conditions.
10. The project relies on substantial public transit service; there is no way the MTA can meet proposed transit demand; the No. 7 line will be gridlocked if this project is built; commuters will face huge delays.
11. The Willets “West” Mall will add another 28,000 car and truck trips to the 80,000 reported in the FGEIS adding 61 million miles of travel each year in proximity to the project increasing traffic accidents by 496 and costing motorists and the surrounding communities nearly \$40 million each year in increased health care and property damage costs.
12. The addition of 61 million miles of vehicular travel produces considerable externality costs, not just traffic accidents costs but the health costs of added air pollution, traffic noise, water pollution and so forth. These costs are not trivial: for full Willets Point build out including

the Willets “West” Mall these costs total \$120 million every year—costs that are far greater than any benefits provided to NYC by the Willets Point project.

13. Assuming the assumptions reported in the SDEIS are correct (and we do not believe they are) total project build out will generate 194 million added vehicle miles of travel, increase traffic accidents by 1,578 at a cost to motorists and Queens residents of \$124 million annually; externality costs for total build out including accident costs in 2032 would total \$382 million annually.

Attached are more details about what is wrong with the SDEIS and what information is still needed by the City Planning Commission to make an informed judgment about this project. Just remember, once the full Willets “West” Mall/Willets Point Project is completed the area will suffer extreme congestion levels that cannot be mitigated.

QUESTIONS THAT MUST BE ANSWERED IF NEW YORK CITY PLANNING COMMISSION IS TO FULLY UNDERSTAND THE TRANSPORTATION IMPACTS OF THE PROPOSED WILLETS “WEST” MALL/ WILLETS POINT DEVELOPMENT PLAN

I have been asked by Willets Point United (WPU) to comment on the transportation component of the Supplemental Draft Environmental Impact Statement (SDEIS) for the proposed Willets “West” Mall/Willets Point Development Plan. The following comments refer to the SDEIS and to related documents listed at various web sites.

My name is Brian T. Ketcham. I am a licensed Professional Engineer, licensed in the State of New York. I am currently retired. Before retiring I worked for more than 4 decades on various transportation engineering projects. I still operate Brian Ketcham Engineering, PC, assisting low and moderate income communities in analyzing proposed projects and holding developers and government officials accountable for compliance with environmental laws and regulations. My most recent project is the Willets Point Development Plan, in which I performed detailed technical analyses. I have participated in dozens of other similar projects, some as large as Willets Point. I also was Vice President of Konheim & Ketcham, a full service environmental engineering firm with projects for the New York State Thruway Authority, the New York State Department of Transportation and the New York City Department of Transportation, among many other agencies and private clients, for which we prepared full environmental impact statements along with detailed traffic plans and models. K&K was closed at the end of 2006. I was also Executive Director of Community Consulting Services over twenty years during which we undertook hundreds of projects supporting low income communities on a pro-bono basis, providing more than 65,000 hours of free engineering services on projects like the Atlantic Yards project in Brooklyn and Hunts Point in The Bronx. Before this I was Executive Director of Citizens for Clean Air, an organization responsible in the 1960’s for New York City’s clean air programs and for bringing the first law suit against the Westside Highway Project in which the federal courts denied the City, State and federal government’s permits to proceed with this project in 1975. This was the first and last time such a suit was undertaken against so large a highway project and was actually won in the public’s interest. The Westside Highway Project was again defeated two years later when NYCDEC refused, based on my demonstration in evidentiary hearings, to again issue a permit for the construction of Westway. And before this I was director of the Bureau of Motor Vehicle Pollution Control for the New York City Department of Air Resources. For this organization I set up a new emissions test facility which, in 1971, had more cars equipped with catalytic emissions controls than the entire world’s automotive industry. Along the way I built (as a private citizens and at my own expense) a three-way catalyst equipped car demonstrating we could meet Clean Air Act emissions standards and improve fuel economy, showing the Congress of the United States that if two young engineers using their own funds to accomplish what the auto industry said could not be done,

certainly auto makers with billions of dollars in resources could at least match what we could do. The result was that Congress did not cave in to demands by auto makers to extend or relax emissions control deadlines. Finally, I was asked by the New York State Department of Environmental Conservation and the United States Environmental Protection Agency in 1972 to prepare New York's Clean Air Plan required by the 1970 CAA. I completed this work in less than 9 months meeting the stringent federal requirements. New York's Clean Air Plan is the most comprehensive transportation plan that has ever been completed for New York City. For this work I was honored in 1993 by Mayor John Lindsay as the most effective manager in New York City government under the age of 35.

The following are examples of what is wrong with the SDEIS supporting this project. More problems and questions will be identified over the coming months.

NYCEDC CLAIMS THEY CAN MITIGATE 65% OF WILLETS POINT TRAFFIC IMPACTS WITH THE ADDITION OF WILLETS "WEST" MALL. THIS IS NOT TRUE.

The developer has reported he will add another 1.4 million square feet of shopping mall/entertainment facilities to the already oversized Willets Point Development project. The developer claims he will actually reduce the impact of this added traffic on the severe congestion along access roads and on nearby expressways already reported in the Willets Point FGEIS. According to the FGEIS the 11 million square feet Willets Point project will add 80,000 car and truck trips to the project area producing "significant" impacts at 78% of all intersections analyzed. Adding Willets "West" Mall will increase project traffic by about 25% impacting even more severely nearby intersections, expressways and expressway entry/exit ramps creating even worse congestion than reported in the FGEIS. Mitigation including the public expenditure of tens of millions of dollars on traffic improvement measures will reduce impacts slightly. However, for many locations full mitigation cannot be achieved and breakdown conditions will prevail. LOS F is reported at many mitigated intersections—for full intersections (many that cannot be mitigated at all) and/or at many intersections they claim to mitigate that retains one or more intersections approaches that remain LOS F or worse. This is what was reported in the FGEIS for Willets Point and the addition of the Willets "West" Mall will make these conditions worse. To claim that adding the Willets "West" Mall will actually make traffic congestion along access roads and on expressways and expressway access/egress ramps is simply not true—it is a lie intended to trick the host community and the New York City Planning Commission into accepting this new project. The consequences of building a 13 million square foot development in so isolated a site will have consequences far beyond the illusion provided by NYCEDC and the developers (see more below).

THE DEVELOPER MUST EXPLAIN THE CONSEQUENCES OF LEAVING MOST INTERSECTIONS ALONG MAJOR ACCESS ROUTES TO WILLETS POINT IN GRIDLOCK CONDITIONS AFTER APPLYING ALL AVAILABLE MITIGATION

The SDEIS reports operating conditions at approximately 30 key intersections affected by the Willets Point project. While relatively few intersections are examined in the SDEIS, project impacts are clear: adding 8,000 to 10,000 hourly car and truck trips to peak travel hours will impose severe restrictions on travel. This can be seen by examining Table 14-59 which shows

project impact for virtually every intersection examined in the SDEIS. More detail can be found by looking at the data presented in Table 22 from Chapter 21 on mitigation.

A review of all results for peak hours with available mitigation shows that during evening peak hours, access roads to Willets Point (Northern Blvd., Roosevelt Avenue, Astoria Blvd.) will be gridlocked. Table 21-6, which I have marked up and attached, shows how severe the developer will leave these major access arterials to Willets Point. With all the mitigation the developer can muster he leaves critical intersections with overall average vehicle delay of 100 to 200 seconds. And these conditions do not get any better on Saturday. Table 27 illustrates the point for a couple of critical intersections. While Table 22 shows some locations along these access roads can be fully or partially mitigated, the community is still faced with gridlock traffic conditions with cars facing two or three signal cycles to move through an intersection with traffic spilling back into adjacent intersections. Certainly the developer has modeled this condition. But he does not provide or describe the results.

Again, looking at Table 22 for 126th Street at Roosevelt Avenue and 34th Street, we find a number of intersection approach movements at LOS F, with delays of between 100 to more than 800 seconds. These are the major entry points to the Willets Point Development. Project traffic creating huge delays will create a huge impediment to the operation of Willets Point and will be of even greater consequence on a METS game day. And, of course, these conditions are only for “average” days not Fridays. Destination retail will experience 19% more traffic on days in December when traffic will be 42% higher than reported. How can the developer justify so large a project with the horrible traffic conditions reported in the SDEIS that cannot be mitigated? And, because we think the developer has under reported trip generation, traffic conditions will be worse than reported.

For example, the complexity of the Roosevelt Avenue/126th Street intersection – a main entry point into the Willets Point project – is not discussed in any detail (this problem is mentioned briefly). How do the columns supporting the overhead No. 7 transit line impede the efficient movement of traffic or reduce sight distance and thus affect safety? As noted elsewhere, the City Planning Commission needs intersection expressway drawings to make this review more effective.

When faced with breakdown conditions in all directions can the developer honestly say that this project will not create huge traffic delays along access roads spilling back onto the surrounding expressway system even with all the mitigation that he can dream up? Can he not admit that this project will have a huge negative effect on this community, imposing greater traffic delays, more traffic injuries and deaths and other costly externalities borne by the million motorists already passing by Willets Point each day on nearby expressways and arterials even with his most optimistic assumptions?

THE ENVIRONMENTAL ASSESSMENT FOR THE VAN WYCK RAMPS MUST BE UPDATED/REVISED

Why did not NYCEDC and/or the developer revise the Environmental Assessment (EA) for the Van Wyck ramps? The SDEIS reports the Willets “West” Mall will be adding about 28,000 car and truck trips to the WP area (and a great deal more if their assumptions are wrong) for average weekdays. Adding the Willets “West” Mall traffic results in significant differences in

background traffic that will affect travel conditions with the ramps. These trips, as many as 3,000 an hour entering or leaving the Willets “West” Mall, will get onto nearby expressways affecting the baseline conditions examined to determine the environmental impacts of the Van Wyck ramps to be constructed. The SDEIS itself reports that the Willets “West” Mall will produce significant traffic impacts on surrounding expressways requiring costly mitigation (should funds be available) (SDEIS Page 21-27). The EA must be updated.

WHAT GUARANTEE CAN THE DEVELOPER PROVIDE THE COMMUNITY THAT THE MTA CAN ACCOMMODATE WP TRANSIT DEMAND?

The developer is relying on the MTA to provide additional bus service to the WP “West” location. WP “West” Mall will produce about 14,000 additional bus riders on an average weekday. At 56 people per bus (capacity) that would require the addition of 250 weekday buses (most spread out from 10 am to 8 pm). What guarantee can the developer provide that the MTA can provide this level of added bus service?

At the third meeting of the Building/Zoning Committee of Queens CB7 the developer mentioned that they were working with the LIRR on using that service to provide some relief for the overcrowding their project will create on the No. 7 subway line. Has the developer analyzed the potential for utilizing the LIRR? If so, what have they found? And, how realistic is using the LIRR during peak commute hours?

CAN THE PROJECT EAST OF 126TH STREET ACCOMMODATE NEARLY 600,000 SF OF LOCAL RETAIL AND, IF SO, HOW?

What is the basis for assuming 593,000 SF of local retail east of 126th Street? This assumption appears very high for a project with just 5,850 residences, approximately 12,000 residents (plus workers and others, although local retail is nowhere close to the Willets “West” Mall and entertainment center and additional retail would be redundant for the Willets Point “West” shopping mall). Moreover, assuming stores are 60 feet deep the developer is looking at installing nearly 2 miles of store front space in the original Willets Point project. We don’t think there is enough space for this much local retail. And, with all this local retail using curb space where will 657,000 SF of additional destination retail go if all frontage is occupied by local retail? So, what’s the point of so much local retail? Considering that just 15% of shoppers are assumed to arrive by auto for local retail we believe this is the developer’s way of hiding auto trips and minimizing traffic impacts. We are convinced that more than half of this “local retail” space will, in fact, end up as destination retail. The SDEIS must be revised to account for this worst case condition. See Table 4, attached, that reports the impact on travel.

WHAT IS THE BASIS FOR ASSUMING JUST 59% OF DESTINATION RETAIL SHOPPERS WILL USE AUTOS TO ACCESS THE SITE?

A comparison of the rates used in the SDEIS with those reported in the 1991, 2001 and 2012 CEQR Technical Manuals shows little change in trip generation rates over this period. We know that many of the assumed trip generation rates date to the Regional Plan Association that did counts in the early 1960’s in Manhattan. How can the developer justify using these antiquated rates especially outside Manhattan? The CEQR Technical Manual advises that if rates are over 3 years old the developer should take counts at representative locations. WPU has repeatedly

requested that the developer undertake such counts. For a project of this size with the severe traffic impacts that the developer has reported in the SDEIS how can they continue to rely on ancient data? We believe that the rates used in the SDEIS significantly under report traffic impacts.

For example, take Willets “West” Mall: The developer assumes that 59% of shopping trips will be made by auto with the rest by walking or transit. This number appears incredibly low when compared to other isolated shopping malls like Gateway Plaza in Brooklyn or Palisades Mall in West Nyack, both of which exceed 95% of shoppers arriving by auto; and both of which provide double the parking per 1,000 SF of retail space. The developer must provide its source justifying this 59% assumption. Would it not be wise to plan for higher auto use in so isolated a site, especially in Phase 1 of this project? The consequences of under reporting auto use on parking and traffic are very significant to this community.

The effects of using reported auto use for isolated destination malls compared to 59% are striking. Tables 1 and 2 (attached) provide a comparison. Table 1 reports the data provided in the SDEIS for Phase 1A. It shows that average daily vehicle trips for Phase 1A would total 28,524 with destination retail making up 81% of this total. Table 2, assuming 90% of shoppers at destination retail arrive by auto, shows an increase in total average daily car and truck trips of 39,345 with destination retail responsible for 86% of total. Table 2 reports a 38% increase in the number of trips from just this one reasonable change, increasing shopper trips to destination retail from 59% to 90%. Vehicle miles of travel would increase by 36% to 83 million miles of vehicular travel annually, from 61 million estimated using SDEIS assumptions.

Another hypothetical, along these same lines, is presented in Tables 3 and 4. Table 3 reports total vehicle trip generation for full project build out, Phase 2, (again for an average weekday) of 87,532 trips, with destination retail producing 50% of this total. However, we dispute not just the use of 59% for shoppers accessing the Willets Point site by car; we dispute the total amount of local retail (there just does not appear to be enough space to accommodate even half what is proposed as discussed above). Table 4 assumes that for Willets Point “West” we stick with 90% of shoppers accessing destination retail by auto (it is an isolated site with poor transit access). However, we assume that for destination retail east of 126th Street 80% of shoppers will arrive by auto. We also assume that the additional local retail proposed for Phase 2 is assumed to be destination retail. The result is an overall increase in average weekday vehicular travel to 109,386, an increase of 21,864 trips, and an increase of 25%. This is a conservative adjustment. We have not tinkered with other trip generation assumptions, most of which do not have supporting documentation.

THE DEVELOPER HAS OVERLOOKED WORST CASE TRAFFIC CONDITIONS

The SDEIS reports average weekday and average Saturday traffic impacts. Not disclosed are the weekly and seasonal variations. For example, the Institute of Transportation Engineers *Trip Generation Manual* reports that for shopping malls Friday traffic is 19% greater than weekly averages and for Saturday, 51% greater. It also reports that Decembers produce 42% more traffic during the month than for annual averages. None of this is reported in the SDEIS although WPU has repeatedly brought this issue to NYCEDC’s attention (and, allegedly, the SDEIS is claiming to “report” “worst case” conditions). Were these differences to be accounted

for you would find true “worst case” conditions would be significantly worse than reported. Parking would also be significantly over-capacity. Surely your traffic engineers understand these effects. Annual average project impacts are severe enough. What can we expect when auto trips are half again higher, holiday effects kick in and parking supply is good for only half of demand? This condition has to be accounted for.

THE DEVELOPER IS NOT PROVIDING ADEQUATE PARKING FOR THIS PROJECT. PLUS THE SDEIS MANIPULATES TEMPORAL ASSUMPTIONS TO MINIMIZE PEAK HOUR PARKING DEMAND.

As suggested by what has already been said, parking is critical. Yet, the developer is providing half what other similar locations are providing. The developer appears to justify this on the basis of extremely optimistic trip generation rates and the heavy use of public transit that really does not exist. Could this project be built if the developer had to provide double the number of parking spaces promised? Can the developer provide this community a guarantee that, should our worst fears come to pass, that parking is not adequate, that they will actually build additional parking garages to supplement the meagre supply of parking promised?

As noted above, experience elsewhere at large malls suggests not only that they attract many more auto trips per 1,000 square feet of retail space, but they typically provide double the number of parking spaces per 1,000 square feet of retail space than is being provided at either the Willets “West” Mall or for the destination retail proposed for Phase 2 of the project. These differences must be addressed by NYCEDC and the developer.

Also, on Table 14-39 the developer loads 15% of daily destination retail travel onto the weekday 1 to 2 pm hour, moving a substantial amount of traffic away from peak travel hours. Tables 14-50 and 14-60 are consistent with this assumption. What is the basis for this assumption? It does not agree with ITE numbers for large shopping malls. What is the basis for all parking temporal characteristics for all land use types? The developer’s source is “Based on travel demand estimates.” That “source” is not good enough. This needs explanation! Has the developer done surveys for parking conditions at other locations and, if so, can he provide the raw data to Willets Point United and to the City Planning Commission? The developer must provide documentation justifying the assumptions made for hourly parking arrivals and departures for the eight land use types evaluated in the SDEIS.

THE DEVELOPER HAS LEFT OUT THE LONG ISLAND EXPRESSWAY IN HIS EXPRESSWAY ANALYSIS

Why did the developer not include the LIE in his traffic analysis? They assign about a sixth of WP traffic to the LIE (and a third of WP traffic to the Van Wyck Expressway). The LIE is already one of the ten most congested roads in the entire United States (so is the Van Wyck and the Grand Central Parkway). The GCP is also not included in the SDEIS, at least that portion of the Grand Central south of the LIE where NYSDOT engineers report it cannot take “one more new vehicle trip from the WP project” even after they spend \$1 billion realigning that expressway near the Jackie Robinson Parkway. Both will be heavily impacted by the expanded Willets Point project (another 28,000 daily car and truck trips from what was examined in the FGEIS). Both should be examined in a revised EA for the Van Wyck ramps.

What is equally incredible is that expressway data are totally missing from the SDEIS; internal site specific traffic movements for the WP project are no longer provided as well. How does NYCEDC expect anyone to evaluate the SDEIS when the traffic network has been simplified so greatly, removing critical data that was originally provided in the FGEIS? This, by the way is how the developer can claim they are mitigating a greater number of intersections—they simply eliminate those reported in the FDEIS and presto, you have fewer affected intersections. It is all a game!

Still, Chapter 21 on mitigation provides considerable insight on project impacts and how hard it is to mitigate so large a project as Willets Point. Table 21-23 attached shows the significant impact for Phase 2 for an average weekday with no games underway. It shows that, while some improvements can be made (very little is described about what, precisely, mitigation involves) it also shows the traffic mess that is left. Table 21-24, also attached, just reaffirms the huge region wide impact the Willets Point project will impose on the surrounding residential communities as well as on the million or so daily motorists who try to thread their way north and south, east and west. The impacts are severe and the SDEIS provides little confidence that much real mitigation can be accomplished and reinforces the communities concern of the mess the developer will leave behind.

THE SDEIS HAS NO DRAWINGS OF EITHER INTERSECTIONS OR EXPRESSWAYS AND RAMPS SHOWING HOW THE DEVELOPER PLANS ON MITIGATING IMPACTS

With the exception of one location we cannot find detailed descriptions of what mitigation the developer is proposing for various expressways or expressway ramps. No description, no drawings. How can the City Planning Commission assess this project without more detail? The developer must provide drawings illustrating each mitigation location. Written descriptions are too brief and just not good enough for public review. And, the 2-point type used in the summary sheets is not legible!

Much of the mitigation proposed in the SDEIS requires the preparation of a site specific Environmental Assessment along with traffic analysis and engineering drawings all subject to NYSDOT and FHWA approval. Each action requires new counts specific to each location. Many of these EAs take from 3 to 10 years to complete and get approved. I have been involved in dozens of these traffic improvement studies – some have taken two decades and 3 or 4 full detailed revisions costing \$10's of millions – more than half these projects never materialized. The SDEIS warns of this problem on page 21-29: mitigation "...measures that may call for detailed review by both NYCDOT and NYSDOT...if these mitigation measures are modified or rejected by the review agencies, significant adverse impacts identified above would be unmitigated." What guarantees can the developer provide that the WP project will not experience the same delays and what impact would that have on project completion schedules? And what if the developer cannot mitigate traffic impacts as promised repeatedly in the SDEIS? What guarantee does the WP community have that this developer will not just gridlock this community 24/7?

And, who is going to pay for mitigation? Including intersection expansion plus modifications to expressways and ramps (plus \$70 million for just the Van Wyck ramps) we are looking at

hundreds of millions of dollars in reconstruction. Is the developer expecting NYC taxpayers to foot this bill?

The developer must provide maps showing vehicular trip assignments by land use type for new no-build construction and for full build out trips including the local project road network. The developer must also provide maps showing traffic volumes along all expressways and expressway ramps on which all Willets Point vehicular trips have been assigned with and without WP Phases 1A, 1B and 2.

THE EFFECTS OF WILLETS POINT ON TRAFFIC ACCIDENTS HAVE BEEN IGNORED. THEY ARE SIGNIFICANT

The FGEIS for the Willets Point Development Plan reports that the project will add 80,000 car and truck trips a day, 365 days a year, generating 116 million additional miles of travel annually. Based on NYSDOT traffic accident rates for NYC the WP project will thereby increase auto and truck accidents by 944 a year including 2 dead and 316 injured. Including the cost of property damage the cost to motorists and society total \$41 million in 2017. Adding another 28,000 car and truck trips a day for the Willets “West” Mall will increase this number to 1,578 crashes annually with 3 dead and 528 injured and approximately 2,500 more cars and trucks damaged. The total cost of the combined effect of Willets “West” Mall and the Willets Point Development Plan in 2032 would be \$124 million annually. And this is only part of the cost of adding daily 108,000 more cars and truck to Queen’s roads. See Table 5 for more detail.

THE ADDITION OF WILLETS POINT TRAFFIC PRODUCES HUGE EXTERNALITY COSTS. THEY CONTINUE TO BE IGNORED BY NYCEDC. IT IS TIME THEY WERE ACKNOWLEDGED

It was earlier demonstrated that the Willets Point Development Plan will produce 80,000 more car and truck trips a day generating \$156 million in externality costs annually. The external or hidden costs to motorists, their passengers, and visitors, residents and workers of the area due to increased vehicular use by travel to and from the Willets Point project include the costs of lost travel time, physical injury, health effects, noise impacts, damage to our roads and utilities. Other costs are paid through taxes such as the control of water pollution, oil spills, greenhouse emissions, the lost value of highway land removed from tax rolls, and, most apparent today, the foreign policy and defense costs of protecting the supply of imported oil (why did we spend a trillion dollars in Iraq?). These harms to society and to households and to the general economy are not well recognized by the public because they increase by a small margin with each added mile of travel and because they are spread among the entire public, both vehicle users and non-users, buried in items such as lower productivity, higher consumer prices and higher insurance costs. But taking them together, even using a low range of vehicle related costs due to the Willets Point project car and truck use greatly reduce the realistic local economic benefits of the project. The costs are based on the well-documented costs per vehicle of mile travel published by the Victoria Transport Policy Institute (VTPI)¹ as well as independent cost accounting that I have undertaken over the last three decades. For this report, the most conservative (i.e., lowest) results have been reported for the social costs of the Willets “West” Mall and the total build out

¹ Litman, T., “Transportation Cost and Benefit Analysis, Techniques, Estimates and Implications,” Tables 6, 7 and 8, Victoria Transport Policy Institute, June 2003, www.vtpi.org/htm.

of the Willets Point Development Project including Willets “West”. The addition of Willets “West” Mall’s 28,000 daily car and truck trips would increase total externality costs to \$382 million a year, an increase of \$120 million just for Willets “West” Mall alone. These totals significantly exceed any benefits of these projects to the communities in and around the Willets Point area. And this does not account for the billions of dollars in public tax payer assistance to the developer, more than a half billion of which has already been spent. A full cost-benefit analysis must be completed for this project before any action can be taken. Without a fully vetted cost-benefit analysis neither the NYCDP, the City Planning Commission nor the City Council can, in good conscience, act on this project. See Tables 6, 7 and 8 for details.

THE CEQR TECHNICAL MANUAL IS NOT THE “HOLY BIBLE” FOR PREPARING ENVIRONMENTAL IMPACT STATEMENTS

In projects like Willets Point as well as during the recent Queens CB7 Building/Zoning Committee meetings, the CEQR Technical Manual has been cited as the “bottom line” in preparing environmental impact statements. It is not! It is a guideline and developers can and should go beyond the minimal requirements spelled out in the Technical Manual. Preparation of the manual was a collaboration between AKRF and the NY City Dept. of Planning. The objective was to create a process that would best facilitate project approvals with the least effort on the part of developers. For the last two decades it has worked brilliantly to accomplish this goal. The CEQR Technical Manual recommends conservative (optimistic) assumptions that are presumed to be gospel by consultants like AKRF. One example is the selection of trip generation characteristics for traffic projections. The numbers recommended in the Technical Manual date from two to three decades back in time when demographics and travel behavior were very different from today. These are the same numbers used in the FGEIS and now in the SDEIS to under report traffic impacts. In recognition of this problem in 1977 the USEPA provided NYC with a million dollar grant to assemble up to date trip generation data. The City assembled consultants like me to voluntarily contribute what they had collected in the field for various land uses. However, after about 6 months it became obvious that the City had no intention of assembling this data; that they were assuming the consulting community would do this for free. The program quickly fell apart. What happened to the million dollars is unknown but no up-to-date trip generation factors for NYC ever materialized. The lowest common denominator should not be the bottom line for this project.

PUBLIC PARTICIPATION IN THE WILLETS POINT ENVIRONMENTAL ANALYSIS IS A FARCE

Over the past five years more than a thousand pages of comments have been generated on the FGEIS, the Access Modification Report, the Phase 1 Report, the Van Wyck Ramp EA and the Final Scoping Document for Willets Point “West”. Thousands of pages containing thousands of comments have had no effect on the outcome of these analyses. NYCEDC, with the help of AKRF, concoct responses to comments that are meaningless: responses that claim that since the comments were not covered in the scope of work or in the CEQR Technical Manual, they require no response, or, if the comment really hits the mark they simply disagree with the commenter. It is all BS and it is intended to frustrate and discourage public involvement. This practice has been followed for three decades. Occasionally something really awful is identified that has to be addressed—somehow. For example, in 2010 I met with the FHWA, the NYSDOT, NYCEDC,

and a host of lawyers and laid out problems that were so significant that it forced a two year delay in the Willets Point project while EDC and their lawyers tried to come to terms with what we disclosed. What did we find? That EDC with the help of AKRF was lying about the project. Presenting one story in the FGEIS and another in the Environmental Assessment for the Van Wyck Ramps. They were also lying about project impacts, hiding traffic volume to under report project impacts. This sad story is all summarized in the 286 page report that I prepared for WPU and that I presented to NYSDOT as part of my testimony on the Willets Point “West” scope of work. It was completely ignored. Very few times over the last five decades have we been able to expose this behavior. The first was the West Side Highway Project or Westway in which I was able to demonstrate to a Federal judge that the consultants were lying about that project. The consultant, Parsons Brinckerhoff, could not explain their work and could not counter my own testimony sufficiently to convince the judge to approve that project. Some of the people representing Parsons Brinckerhoff in that proceeding were the same engineers and administrators who started AKRF in 1982. They lied about Westway and they are lying now about the Willets Point project. I hope WPU can accomplish for Willets Point what I did with Westway 38 years ago.

Brian T. Ketcham, P.E.
July 8, 2013

TABLE 1
Estimating Total Annual Vehicle Trips for the Willets Point WEST Development Plan
(Based on assumptions provided in the FEIS)

WEEKDAY PERSON/VEHICLE TRIPS - PHASE 1A

	Residential	Office	Destination		Local	Convention	Movie	Hotel	Community	PS/IS	PS/IS	TOTALS
			Retail	Retail	Retail	Expo Facility	Theatre		Facility	Students	Faculty

Estimating Total Annual Vehicle Trips for the Willets "WEST" Mall Development Plan
(Based on assumptions provided in the SDEIS)

PHASE 1A (2018) WITH ACTION PARKING

In Phase 1A, the proposed project would provide approximately 2,500 off-street accessory parking spaces to satisfy the projected parking demand due to the development in Willets West and 75 accessory spaces for project demand in the District.¹ As shown in **Table 14-39**, the projected weekday and Saturday peak parking demands for Willets West (1,127 and 2,238 spaces, respectively) is anticipated to be satisfied entirely by the off-street parking facility provided within the site.

Note: Acc = Accumulation
Source: Based on travel demand estimates

As shown in **Tables 14-40** and **14-41**, parking demand from development within the District would not be fully accommodated by the 75 accessory spaces on weekdays or on Saturdays. During the Mets off-season, there would be an additional parking demand of 5 to 131 spaces on weekdays and Saturdays. During the off-season when the recreational uses would be in place, the additional recreational accessory parking demand, if needed, would be provided in Lot B, the north lot, or within the Willets Point District property itself to satisfy this demand.

¹ Additional parking spaces may be provided for off-season recreation uses within the District if they are warranted.

Willels Point Boulevard at Northern Boulevard	x	x	x	x	x	x	x
New Willels Point Boulevard at 126th Street	n/a	n/a	n/a	n/a	n/a	n/a	n/a
Roosevelt Avenue at CitiField / Lot B	n/a	n/a	n/a	n/a	n/a	n/a	n/a

Notes: "x" means the intersection would be significantly impacted. n/a means the intersection is new for With Action conditions.

Parking demand for the proposed residential component would be satisfied through on-street and off-street parking opportunities. As in the 2008 FGEIS, it is assumed that approximately 10 percent of residents would use available on-street parking opportunities, which would reduce the need for off-street parking demand by about 300 spaces. Given the anticipated residential demand of 3,101 spaces, approximately 2,800 off-street residential parking spaces would need to be provided. Residential parking demand is typically lowest during the daytime hours when office, community uses, and primary school parking demands are at a maximum. Therefore, shared parking strategies would be implemented and, where possible, office, community, and primary school parking demands would use parking spaces vacated by residents during the daytime hours. This would maximize usage of vacant residential parking spaces during daytime hours and minimize the need for additional dedicated parking spaces for office, community, and primary school uses.

It is expected that the remaining land uses—retail, hotel, and convention center space—could also share common parking areas. However, because peaking patterns among these uses are similar to each other, there would be minimal savings in the number of required parking spaces. Hence, the projected weekday and Saturday parking demands for these uses are based on the sum of the individual peak demands, or approximately 3,050 spaces and 2,900 spaces, respectively. These

they are found to be significantly impacted under the With Action condition, mitigation measures such as those typically implemented by NYCDOT would be further explored to address the impacts, or if no practicable mitigation measures can be identified, the impacts would be disclosed as being unmitigatable.

TRAFFIC—PHASE 2 (2032)

Table 21-5 presents a summary of significant adverse traffic impacts and their ability to be mitigated, and Table 21-6 summarizes the unmitigated traffic study area locations by time period. Details of the intersection capacity results and traffic mitigation measures are provided in tables at the back of this chapter.

Re: **Proposed Willets Point / Willets West development**
CEQR No. 07DME014Q
Comments pertaining to pending ULURP application and DSEIS

Dear City Planning Commissioners and Dr. Kulikowski:

I am writing on behalf of Willets Point United Inc. to supplement my oral and written testimony delivered on July 10, 2013 at the public hearing associated with the Uniform Land Use Review Procedure ("ULURP") and the Draft Supplemental Environmental Impact Statement ("DSEIS") pertaining to the proposed Willets Point / Willets West development, CEQR No. 07DME014Q. The following information addresses certain questions and issues raised by the City Planning Commission ("Commission") during the public hearing on July 10, 2013.

(1.) What is Willets Point United Inc.?

Willets Point United Inc. ("WPU") is a coalition of Willets Point property and business owners, formed in 2008, that wants the City to stop its decades-long deliberate withholding of municipal services from Willets Point which hinders the operation of the existing industrial businesses here; that opposes the redevelopment of Willets Point in the manner being promulgated by the Bloomberg administration, which includes the forcible acquisition of our properties via eminent domain to transfer to other private parties to facilitate a non-essential, speculative, alleged economic development project; and that holds project proponents accountable for disseminating false information to decision-makers and the public, abrogating their written guarantees, and engaging in plainly illegal activity to push this project; among other WPU initiatives. For example:

- WPU discovered that the draft Access Modification Report ("AMR") pertaining to proposed new highway access ramps to and from the Van Wyck Expressway (ramps that are essential to the entire proposed Willets Point development), submitted by the New York City Economic Development Corporation ("NYCEDC") with the intent that it be approved by the New York State Department of Transportation ("NYSDOT") and the Federal Highway Administration ("FHWA"), relied upon traffic presumptions that

differed dramatically from those contained within the Final Generic Environmental Impact Statement ("FGEIS") previously prepared for the proposed Willets Point development. As the *New York Times* reported: "State officials have repeatedly expressed frustration with the city's inability to provide reliable information and the pressure it was placing on them to expedite their analysis, according to a review of hundreds of e-mails involving the Willets Point project that were provided to *The New York Times*" by WPU. (Santos, Fernanda. 2010. E-Mails Show State Officials' Skepticism About Willets Point Project. *New York Times*, August 13; p. A17.) WPU's traffic engineer, Brian Ketcham, formally interceded with both NYSDOT and FHWA, challenging the AMR during two all-agency meetings convened for that purpose and by submitting hundreds of pages of independent expert analysis. Thereafter, NYSDOT and FHWA did not approve the draft AMR, but rejected it; restructured the ramp approval process to require an Environmental Assessment prior to approval of any AMR; and sent NYCEDC back to the drawing board to draft a new AMR, which took two years.

- WPU discovered that former Queens Borough President Claire Shulman and her local development corporation ("LDC") conducted a lengthy, unlawful, unregistered lobbying campaign advocating approval of the proposed Willets Point development. The Office of the City Clerk agreed with WPU, resulting in a then-record penalty of \$59,090.00 imposed upon Shulman's LDC.
- WPU discovered that not only Shulman's LDC, but also the New York City Economic Development Corporation ("NYCEDC"), violated state law by attempting to influence legislation authorizing the proposed Willets Point development – activity that is absolutely prohibited to all local development corporations. Moreover, NYCEDC disbursed City funds totaling \$450,000.00 to Shulman's LDC, then directed unlawful lobbying by Shulman's LDC. The New York Mets, owned by the owners of Sterling Equities (which has since been designated by the City as a developer of Willets Point phase one), also financed Shulman's LDC. The New York State Office of the Attorney General conducted a three-year investigation and ultimately agreed with WPU, declaring in 2012: "These local development corporations flouted the law by lobbying elected officials, both directly and through third parties, to win approval of their favored projects." (<http://www.ag.ny.gov/press-release/ag-schneiderman-ends-illegal-lobbying-nyc-officials-three-local-development>) New York City Comptroller John Liu wrote to Mayor Bloomberg: "Last week your Administration admitted in a settlement with the New York State Attorney General that the New York City Economic Development Corporation (EDC) knowingly and illegally lobbied City Council members about your development agenda. ... I urge you to move swiftly to identify those senior officials from City Hall and the EDC responsible for the flagrant and repeated law-breaking activities, and hold them accountable." (http://www.comptroller.nyc.gov/press/2012_releases/pr12-07-083.shtm) As a consequence of its illegal lobbying for the Willets Point development, NYCEDC has had to cease operating as a local development corporation and has been compelled to restructure as a different type of not-for-profit entity. The 2008 approvals of the proposed Willets Point development – procured in the context of lobbying so illegal that it required the restructuring of NYCEDC to ensure it will never happen again – still

are the bases of the proposed Willets Point phase one / Willets West development being considered now.

- WPU sued the City because of the inadequacy of the environmental review conducted for the proposed Willets Point development. Among other things, WPU alleged that the City could not pursue a phased development pursuant to its *Technical Memorandum for the Willets Point Development Plan FGEIS*, TM004, dated February 11, 2011 ("Technical Memorandum 4"), and that the City instead must prepare a Supplemental Environmental Impact Statement ("SEIS"). In that court proceeding, on July 24, 2012, the City finally stipulated that "the City will not proceed with development in Willets Point under Technical Memorandum 4"; and the City is now taking steps to finalize a Supplemental Environmental Impact Statement, just as WPU had said was necessary.
- WPU again sued the City to challenge its attempted use of eminent domain to forcibly acquire Willets Point phase one properties. In that court proceeding, on May 2, 2012, the City finally stipulated that it "would not proceed under its [eminent domain] Determination and Findings, adopted by the City on May 2, 2011", and abandoned the particular attempt to use eminent domain that was the subject of that court proceeding. The City may still attempt to use eminent domain again in the future to acquire Willets Point properties.

In each of the above instances, when WPU took a position and the relevant facts were properly taken into account, WPU's position was vindicated.

Presently, it is the position of WPU that the proposed Willets Point phase one / Willets West plan of Sterling Equities and Related Companies ("Sterling/Related") is inappropriate and cannot be implemented.

- (2.) The Commission must consider that the purpose of the special permit to which the ULURP application pertains is to facilitate the shopping mall, and none other.**

At the outset of the public hearing held on July 10, 2013, Commission Chair Amanda Burden stated: "... an important element of the project analyzed in the Draft Supplemental Environmental Impact Statement – the retail development at Willets West on the Citi Field site – is not subject to the land use jurisdiction of the Commission since it is located on parkland. ... Just to make it clear, our purview as City Planning Commission really is on the Willets East part of the project and the temporary interim uses there."

We emphasize that the ULURP application now being considered, which pertains to the prospective use of Willets Point phase one property as a parking lot, has but one purpose: to facilitate the construction of a 1.4 million square foot shopping mall / entertainment center on parkland property. Except for the intent to construct that shopping mall and to relocate the existing parking lot, there would be no pending ULURP application for any special permit to modify the use of Willets Point phase one property. It would be both inappropriate and an abdication of the Commission's responsibilities, for the Commission to narrowly consider just

the parking lot application, while disregarding the specific intended larger effect of that application – the construction of a huge shopping mall on parkland – that will "change the character of the surrounding neighborhoods and impact the livelihoods of 250,000 residents and many small mom-and-pop businesses", as Queens Community Board 3 wrote when it disapproved this application by its vote of 30-1.

The Commission cannot allow the proposed site of the mall – which just happens to be parkland – to circumvent the Commission's responsible analysis of an application that will obviously "change the character of the surrounding neighborhoods and impact the livelihoods of 250,000 residents and many small mom-and-pop businesses". In any other circumstance where an application will "change the character of the surrounding neighborhoods" the Commission certainly would be involved in assessing the potential changes in character, and would necessarily factor them into any decision for or against the application. The Commission's responsibility to the public is to do so here, as well.

WPU and the public-at-large are not the only ones who recognize that this parking lot ULURP application is inseparable from the intent to construct a 1.4 million square foot mall, and that the application must be evaluated in that context. The notice of the public hearing published by Queens Community Board 7 describes this application as: "ULURP APPLICATION #C 130223 ZSQ – To allow for a 1.4 million square foot retail and entertainment development known as 'Willets West.'" (See Attachment A.) As the local community board has formally characterized this ULURP application as allowing for the mall (while not even mentioning the modified parking use at Willets Point), the Commission is able to do the same.

Do not permit an end-run around the Commission's planning oversight – which is what this ULURP application aims to do.

(3.) The 1961 amendment to the City's administrative code provides no basis to construct a shopping mall on the parkland at issue.

Since the purpose of the pending ULURP application to allow a parking lot on Willets Point phase one property is to facilitate the construction of a mall on other parkland property, if the construction of that mall is unlawful then there is no legitimate basis for the pending parking lot ULURP application.

Please review the attached letter from attorney Harvey Epstein, Associate Director of the Urban Justice Center, addressed to land use counsel for Sterling/Related (see Attachment B), which sets forth legal reasoning why the 1961 provision of the City's administrative code provides no basis to construct a shopping mall on the parkland at issue, and why the proposed project of Sterling/Related is therefore "fatally flawed".

If the analysis within the Urban Justice Center letter is correct (and we believe it is), then the Commission is being asked to approve a ULURP application to facilitate construction of a mall that is unlawful and cannot occur. The Commission must not approve a ULURP application that is intended to facilitate an unlawful land use that cannot occur.

(4.) Three other developers submitted proposals that kept within the bounds of the Willets Point Special District and did not add any mall on parkland.

In response to the Request for Proposals ("RFP") seeking developers for Willets Point phase one, three respondents other than Sterling/Related submitted proposals to implement development consistent with the provisions of the RFP, within the bounds of the 23-acre phase one site inside the Willets Point Special District. One of those proposals – submitted by Silverstein Properties, Inc. and Taubman Centers, Inc. – even committed "100% of the residential units in Phase 1 to the affordable housing program".

But the City administration rejected all of those proposals, and instead selected the proposal of Sterling/Related – initially a proposal to construct a casino and gaming facility on the parkland property located west of Citi Field beyond the boundaries of the Willets Point Special District, and which included no housing component whatsoever. The Sterling/Related proposal is said to have been modified such that the parkland property where the casino would have been constructed is now designated as the site of a retail mall and entertainment center, and housing is to be constructed within the Special District in the year 2028 (but only if new highway access ramps to and from the Van Wyck Expressway are constructed first – ramps that no one is obligated to construct, and that the project contract specifies the City is not responsible to build). The plan of Sterling/Related also expands the total size of the Willets Point development from 62 acres as approved during 2008, to 108.9 acres as intended now. The Draft SEIS ("DSEIS") explicitly admits this.

The decision to select the plan of Sterling/Related to the exclusion of all others was made by the City administration via a process that violated written guarantees within the Willets Point FGEIS and elsewhere, that the Willets Point Advisory Committee, led by Queens Borough President Helen Marshall, as well as Queens Community Board 7, would participate in and help to guide developer selection. Instead, those Queens entities were completely excluded from the developer selection process. As we now know, the developer selection process was also an opportunity to choose a plan that would not expand the size of the development from 62 acres to 108.9 acres (with associated increased impacts), and that would not sacrifice 30+ acres of Queens' public parkland for use as a retail mall. It is no wonder that the City administration circumvented the promised involvement of Queens entities, and instead dictated the choice of developers.

In the event that the pending ULURP application of Sterling/Related is disapproved, the City can issue a new RFP for development within the Willets Point Special District that does not sacrifice parkland for use as a mall, and that otherwise respects the goals of the Willets Point development as approved in 2008. If the prior RFP responses are any indication, there will be proposals that respect the property boundaries while realizing the goals established in 2008.

Attached is an informative flyer prepared by WPU (see Attachment C) that summarizes the three rejected development proposals. Also attached is a CD-R disc containing the three rejected RFP responses (see Attachment D), so that the Commission may appreciate that Sterling/Related was not the only available choice, and would not be in the future.

(5.) The City and Sterling/Related are deliberately avoiding conducting any environmental tests at this time on Willets Point phase one property.

During the public hearing held on July 10, 2013, Sterling Equities' representative Richard Brown testified: "As soon as we close, we will be in there doing investigative work of all 23 acres, both above grade and below grade. There's been very limited work done at this time – rightly so, because the city has not had possession. We are to be delivered vacant possessions. So whenever that happens, day one, day two, we go in and we start all of our testing."

But the City claims to already own 95 percent of the Willets Point phase one property. Contrary to the misleading testimony of Richard Brown, nothing prevents the City from performing borings, obtaining soil samples, and conducting environmental tests **right now** throughout the 23-acre phase one site. That the City has not done so is very telling.

The City administration spent upwards of \$200 million of taxpayer funds to acquire the Willets Point phase one property, but intends to gift that phase one property to Sterling/Related for the price of \$1 (one dollar). It is bad enough that such a deal is contrary to what City officials told the City Council during 2008: that the City would recoup the cost of acquiring the property, through the sale of the property to the developer. As we understand it, the new rationale for the steeply discounted \$1 price is that the property has "negative value", because it is allegedly contaminated. But with no scientific tests performed, how can the taxpayers be certain that a discount of \$200+ million is actually warranted?

The City and Sterling/Related are deliberately delaying any environmental testing of Willets Point phase one property until after Sterling/Related have closed the property transaction and taken possession of the property. WPU alleges that they are doing so, because (a) if testing was performed now and it determined that the property is not severely contaminated and required little or no remediation, then there would be no justification to transfer the property to Sterling/Related at the sweetheart deal price of \$1, when they should instead pay the going market rate (as the City Council was promised would be the case during 2008); and (b) if testing was performed now and it determined that the property is very severely contaminated, Sterling/Related might conclude that implementing the proposed development is not financially viable – precluding transferring the property to them at all. For those two reasons, the City and Sterling/Related cleverly prefer not to perform any environmental tests at this time, but to delay any tests until after Sterling/Related have taken possession of the property for the price of \$1. That way, no matter what the test results ultimately show, Sterling/Related will possess the property that they covet – even if it can only be paved over for use as a parking lot. But to delay important environmental tests that could be performed now is not in the taxpayers' interest, and constitutes reckless non-planning.

Is the \$1 price justified? Is the proposed remediation and development feasible? Without scientific environmental testing throughout the Willets Point phase one property, it is impossible to answer those key questions. Therefore, the first order of business – before establishing the price of the property, and before transferring ownership of it – must be to perform the environmental tests that are being purposefully delayed until later.

(6.) Unknown "feasibility" and "effectiveness" of traffic mitigation measures – despite relying completely on them.

DSEIS chapter 21 describes traffic mitigation measures. It acknowledges that not every traffic impact can be mitigated. In our opinion, the remaining unmitigated impacts are collectively so severe as to make this proposed development inappropriate and unworthy of approval. Even with the most optimistic mitigation measures in place, a number of intersections at major entry points to the proposed development will operate at Level of Service "F" (fail), with delays of between 100 seconds and more than 800 seconds (13 minutes!).

DSEIS chapter 21 also describes circumstances in which very severe traffic impacts caused by the proposed development (described within DSEIS chapter 14) are completely reversed by the recommended hypothetical mitigation. We think it is dangerous to trust this self-serving mitigation report.

First, DSEIS chapter 21 (the mitigation report) quietly states: "The effectiveness and feasibility of proposed mitigation measures will be further assessed between the draft and final SEIS" (page 21-2).

In other words, no one is committing to the "effectiveness" and "feasibility" of the specific mitigation measures that are being touted now to decision-makers, and which so miraculously improve traffic conditions. Rather, a future, final version of the mitigation report may conclude that all or some of the recommended mitigation measures are simply not effective, or even "feasible" – in which case improvements in traffic flow shown in the present mitigation report will **not** occur, and those impacts may instead be unmitigated.

How can anyone rely upon a report that cannot vouch for even the "feasibility" of the alleged solutions that it presents?

How can the report represent that certain mitigations are essential – without knowing if they are even feasible?

Second, per the mitigation report, some of the recommended mitigations are "measures that may call for detailed review by both NYCDOT and NYSDOT and which represent preferred improvements that would benefit the overall traffic network. As discussed above, if these mitigation measures are modified or rejected by the review agencies, significant adverse impacts identified above would be **unmitigated**" (emphasis added; page 21-29).

In other words, achieving the vastly improved traffic flows described in the mitigation report requires measures that NYCDOT and NYSDOT have not yet reviewed or approved, and which they may eventually reject. At the present time, no one can guarantee that any such mitigation measure will actually be implemented.

Please refer to the analysis of WPU's traffic engineer, Brian Ketcham, submitted together with my written testimony at the public hearing held on July 10, 2013, to understand the severity

of the actual traffic impacts of the proposed project. DSEIS chapter 14 also sets forth what the traffic impacts of the proposed project will be, in the event that mitigation measures cannot be implemented or turn out to be ineffective.

- (7.) **The Commission has bent its rules to accommodate immediate proxy testimony in favor of the proposed development, while enforcing its rules and delaying proxy testimony opposed to the proposed development.**

At the public hearing pertaining to the proposed Willets Point development held on August 13, 2008 – during a section of that hearing dedicated to testimony in opposition to the proposed project – the name "Kevin Loyst" was called to testify. In place of Kevin Loyst, a person named Kevin Phillips came to the podium, identified himself, and stated that he was "here to speak on behalf of Kevin Loyst, who's a colleague" who had to depart the hearing after several hours.

Commission Chair Amanda Burden prohibited Kevin Phillips from testifying at that time as a proxy for Kevin Loyst, telling Phillips unambiguously: "You have to sign up on your own. It's a rule, we have to do – You can't substitute for somebody else. Sorry. So if you just sign up on your own. ... Just sign up on a new card. **You have to sign up for yourself. You can't substitute for somebody else.** ... We will definitely call you, later."

Kevin Phillips then left the podium, and the Commission called a different speaker.

We would have expected consistent enforcement of the Commission's rules at the public hearing recently held on July 10, 2013, when – during a section of the hearing dedicated to testimony in favor of the application – the name "Dan Hendrick" was called to testify, and an unidentified person who was not Dan Hendrick came to the podium. The unidentified person stated that he was "actually here on behalf of Dan Hendrick, who is the V.P. for the New York League of Conservation Voters".

Neither Commission Chair Amanda Burden nor any other Commission member stopped this unidentified person from testifying "on behalf of Dan Hendrick", or enforced the Commission's strict rules that "you have to sign up for yourself" and "you can't substitute for somebody else". The unidentified person proceeded to deliver testimony as a proxy for the absent Dan Hendrick, in favor of the application.

The Commission has treated unequally those who would provide proxy testimony opposed to the Willets Point development, versus those who would provide proxy testimony in favor of the Willets Point development. Kevin Phillips, who was opposed, was relegated to filling out a new speaker's card and beginning the long wait to testify, again; whereas the unidentified person who appeared on July 10, 2013, who was in favor of the application, was welcomed and testified immediately.

WPU intends to post video recordings showing the Commission's unequal treatment of the two above-described speakers on our YouTube channel

(<http://www.youtube.com/user/WilletsPoint>) by Monday, July 22, 2013.

The ULURP process must be neutral and devoid of any such bias. It is no less appropriate that a proxy speaker in favor of the Willets Point development be given a special privilege, than it is that the City should fund an unlawful lobbying scheme to influence decision-makers to approve the project. Both of those tactics, and many others, large and small, have been leveraged by powers-that-be against Willets Point property and business owners – and the WPU membership will not tolerate it.

(8.) The application has significant opposition and virtually no public support.

Significantly, during the public hearing held on July 10, 2013, **no one** from the public ever requested that the Commission approve the pending ULURP application so that they may shop at a Willets West mall built on parkland, park their vehicle on Willets Point phase one property, use a golf driving range at Willets Point during the Mets off-season (i.e., during wintertime), or do anything else that is associated with the ill-conceived, unwanted Sterling/Related project. Indeed, there was a very obvious lack of public enthusiasm for this proposed project during the Commission's public hearing.

Testifiers opposed to the Sterling/Related application outnumbered those in favor. And it must be noted that those in favor merely consisted of NYCEDC employees, AKRF employees, developers' attorneys, and one union member. Simply put, there is virtually no public support for the project which the ULURP application would enable.

(9.) The DSEIS relies upon plainly inaccurate "No Action" baseline conditions.

The DSEIS states: "For the purposes of a conservative impact disclosure, this SEIS assumes that the **existing uses on the project site would be maintained** in each of the three No Action scenarios" (emphasis added; page 1-12).

However, that assumption is inaccurate, for at least two reasons:

First, the City intends, and is already taking steps, to evict tenant businesses that operate throughout the Willets Point phase one property. Tenant businesses are receiving telephone calls from representatives of the New York City Department of Housing Preservation and Development, informing the businesses that they will receive written vacate notices after July 22, 2013. That the City is issuing vacate notices even before obtaining any approval from the Commission or from the City Council that would enable the Sterling/Related proposal to proceed, indicates that the City intends that the tenant businesses vacate the phase one site, regardless of whether the pending ULURP application is approved or any development ever occurs.

The City cannot inform tenant businesses that it will evict them, and proceed to do so, while falsely assuming in the DSEIS exactly the opposite – that "existing uses on the project site would be maintained". Rather, the text of the SEIS must reflect the reality of the circumstances

in the Special District, and the intention of the City. If it does not, then the SEIS is inaccurate.

Moreover, the City has not disclosed what will become of the City-owned Willets Point property in the event that the City's proposed Willets Point development does not occur, but it must do so now in order to ensure an accurate SEIS analysis.

Second, the SEIS must account for the likely future effects of the newly-installed sanitary and storm water sewer lines along 126th Street directly adjacent to Willets Point property, which will be complete by the time the SEIS is finalized, or shortly thereafter.

Whereas during 2008 when the FGEIS was prepared no new sewer main lines actually existed at Willets Point, that is not the case now at the time that the SEIS is being prepared. The existence of the long-sought sewer lines is a significant change in background conditions affecting the entire Willets Point site. All "no action" scenarios described in the SEIS must take into account the likelihood that some existing Willets Point property owners will seek to connect to the new sewer main lines, especially as doing so would facilitate the development of their properties which they have consistently said time and again they would do, if sewer lines existed. It is inconceivable that the sewer lines, having been installed, will not be used.

As part of the SEIS analysis, the City must assess what owner-development would likely occur, even "without action" on the part of the City, now that the sewer main lines exist. The conclusion cannot be that "no change" would be made to any portion of the project site, and that "the existing uses on the project site would be maintained". The sewer lines are bound to inspire changes, and the City is responsible for assessing what those changes might be, as part of the SEIS analysis. That analysis should include outreach to all Willets Point private property owners, to discuss whatever intentions they may have to connect to the sewer systems and enhance the uses of their properties beyond those existing today, in the event that the City's proposed Willets Point development does not occur. To presume that nothing about the area will change despite the presence of the long-sought sewer lines, is to severely underestimate the ambition of the private property owners; and guarantees an inaccurate SEIS analysis.

(10.) More tenant businesses are impacted than the Commission has been led to believe.

The public hearing on July 10, 2013 included testimony from representatives of the Sunrise Cooperative, an association of approximately 60 tenant businesses that are seeking to relocate together (co-locate) in a group or groups. It is our understanding that some of those 60 businesses are located within Willets Point but beyond the 23-acre phase one area that would be affected if the present Sterling/Related plan proceeds.

In the recent eminent domain court case pertaining to a first phase of Willets Point property that was substantially similar to the phase one that is presently contemplated, the City's "Response to EDPL Comments" dated May, 2011 acknowledged that 139 auto related businesses in the first phase would be displaced.

Accordingly, it is important to recognize that the majority of tenant businesses to be

displaced by the present plan are **not** members of the Sunrise Cooperative, and that even if all 60 businesses that are Sunrise Cooperative members would be successfully relocated (and there is no indication that they will be), there are still 79 or more other business within the phase one area – in fact, the majority of affected businesses – that would still need to be relocated, and that would **not** be helped by any Sunrise Cooperative plan.

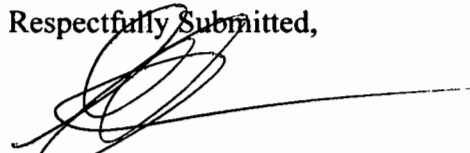

The 79+ businesses that are not members of the Sunrise Cooperative for whatever reason (for example, because they decline to pay the membership dues charged by Sunrise Cooperative) are just as dependent upon co-location for their future survival as are the members of the Sunrise Cooperative. A City administration that is truly interested in preserving businesses, jobs and livelihoods would implement a co-location plan that treats all affected businesses equally, instead of favoring a subset of businesses that have joined a particular group; and would not pretend that other businesses do not also need co-location.

Even as City representatives have told the Commission that the tenant businesses will be relocated, the tenant businesses are receiving telephone calls from representatives of the New York City Department of Housing Preservation and Development, informing the businesses that they will receive written vacate notices after July 22, 2013. At the public hearing held on July 10, 2013, a Commissioner remarked that "we don't understand" why the City would send any such letters now, especially considering that the project for which the property would be needed has not yet been approved. The City presumptively sending vacate notices to tenant businesses indicates a disrespect for the decision-making authority of the Commission and the City Council, and confirms that the City's priority is to see the approximately 139 businesses gone from the phase one site, regardless of whether this application is approved or any development ever occurs.

That is a far cry from the Commission's suggestions, during the 2008 public hearing for the proposed Willets Point development, that the Willets Point businesses should be relocated elsewhere together, as the City did for the Fulton Fish Market businesses and in other cases.

For all of the foregoing reasons, the ULURP application of Sterling/Related is inappropriate and should be denied.

Respectfully Submitted,

Gerald Antonacci
On behalf of Willets Point United Inc.

Re: Willets Point Development ULURP

Jesse and Ross:

We write to you regarding your client's pending ULURP application, which we believe to be fatally flawed. As the site of the potential redevelopment is part of Flushing Meadows Corona Park, it is covered by New York State's public trust doctrine. That doctrine prevents the use of parkland for non-park purposes unless it has been alienated pursuant to an appropriate state statute:

[D]edicated park areas in New York are impressed with a public trust for the benefit of the people of the State. Their use for other than park purposes, either for a period of years or permanent, requires the direct or specific approval of the State Legislature, plainly conferred.

Friends of Van Cortlandt Park v. City of New York, 95 N.Y.2d 623, 631-32 (N.Y. 2001).

The 1961 law which authorized the construction and financing of Shea Stadium on the lot that your client currently is seeking to redevelop, and which supporters of the redevelopment have cited as providing sufficient authority for the plan, does not explicitly allow the alienation of the parkland upon which the stadium was built. NYC Administrative Code 18-118. The statute also does not specifically refer to the alienation of the parkland in question; nor does it provide for replacement parkland or restitution, as do alienation statutes generally. See New York State Office of Parks, Recreation and Historic Preservation, *Handbook on the Alienation and Conversion of Municipal Parkland in New York*, at 27 (revised March 2012). For this reason alone, Administrative Code 18-118 is insufficient to support the proposed project and the state must pass additional legislation before any redevelopment of this land moves forward.

Even if Administrative Code 18-1118 were sufficient legislative action to alienate the Flushing Meadows Corona parkland in question, the statute does not provide specific authorization for the city's contemplated use today: a shopping mall. New York courts have long held that legislative action permitting alienation of parkland and setting forth the permitted uses must be plain and explicit. As the New York Supreme Court Queens County made clear over a half-century ago in *Aldrich v. City of New York*:

It has been held that legislative authority permitting encroachment upon park purposes must be "plainly conferred." (*Williams v. Gallatin*, 229 N.Y. 248, 253.) When speaking of the legislative authority to alienate public parks, language varying only slightly has been used. Some have said that the legislative authority must be "special" others, that such authority must be "specific" ... or "direct" or "express" Add to the foregoing the well-settled rule that "When there is a fair, reasonable and substantial doubt concerning the existence of an alleged power in a municipality, the power should be denied" (*Matter of City of New York [Piers Old Nos. 8-11]*, 228 N.Y. 140, 152), and it seems clear that the legislative authority required to enable a municipality to sell its public parks must be plain.

208 Misc. 930, 939 (N.Y. Sup. Ct., Queens Cty. 1955).

Administrative Code 18-118 *does not* permit the city to sell or lease the parkland at issue to construct a mall, let alone authorize such activity plainly or expressly. Rather, its very title indicates its express intent: "Renting of stadium in Flushing Meadow". In furtherance thereof Subsection 118(b) sets forth two groups of permitted uses for the land. The first states as follows:

(1) for any purpose or purposes which is of such a nature as to furnish to, or foster or promote among, or provide for the benefit of, the people of the city, recreation, entertainment, amusement, education, enlightenment, cultural development or betterment, and improvement of trade and commerce, including professional, amateur and scholastic sports and athletic events, theatrical, musical or other entertainment presentations, and meetings, assemblages, conventions, and exhibitions for any purpose, including meetings assemblages, conventions and exhibitions held for business or trade purposes, and other events of civic, community and general public interest . . .

Subsection (2) states that the land may also be used "for any business or commercial purpose which aids in the financing of the construction and operation of such stadium, grounds, parking" and other permitted uses set forth in subsection (1).

May 14, 2013

Page 3

Although a shopping mall is a "business or commercial purpose" contemplated by subsection (2), it has not been proposed that any of the proceeds from the venture would aid in the financing of the other endeavors currently located on the applicable parkland. Indeed, all of the provisions of the 1961 Act addressing financing for Shea Stadium (a stadium, we might add, that no longer exists) are obsolete today. Likewise, the contemplated commercial use does not fall under the more narrow range of uses outlined in subsection (1) of the provision. That subsection requires that any proposed use of the land provide *all* of the following benefits to the "people of the city": "recreation, entertainment, amusement, education, enlightenment, cultural development or betterment, and improvement of trade and commerce." (emphasis added). The legislators undoubtedly could have used the term "or" rather than "and" when walking through the scope of permitted uses, but they choose not to do so.

The mall that has been proposed to fill the Citi Field parking lot does not provide any of the benefits contemplated by the statute, let alone all of them. The only language in subsection (1) that even remotely suggests your client's contemplated use is that which allows uses that "promote" "improvement of trade and commerce." However, that language plainly assumes that the contemplated use would *not* be trade or commerce itself. This assumption is further supported by the long list of explicitly contemplated uses in the subsection, a list which includes "professional, amateur and scholastic sports and athletic events, theatrical, musical or other entertainment presentations, and meetings, assemblages, conventions, and exhibitions for any purpose, including meetings assemblages, conventions and exhibitions held for business or trade purposes." Wholly commercial uses—such as a shopping mall—are absent from the provision.

Further, if the state had intended subsection (1) to cover all forms of trade and commerce, such as a shopping mall, it easily could have included the phrase "any business or commercial purpose" in that subsection, as it did in subsection (2). To read the two differently-worded phrases as permitting the same range of activities, however, would essentially be to make subsection (2) entirely superfluous. Norms of statutory construction prevent such a result. *See, e.g., Cohen v. Lord, Day & Lord*, 75 N.Y.2d 95, 100 (N.Y. 1989) ("Words are not to be rejected as superfluous where it is practicable to give each a distinct and separate meaning."). Therefore, there is simply no basis to read the phrase "improvement of trade and commerce" to cover the contemplated shopping mall.

In light of the above arguments, we are confident that the ULURP, as presented jointly by your client and the EDC, would not withstand judicial scrutiny. Accordingly, we urge you not to attempt to move forward as currently contemplated.

Sincerely yours,

Harvey Epstein
Associate Director

Attachment C

**DEVELOP WILLETS POINT,
WITHOUT ADDING A HUGE MALL ON 30+ ACRES OF PARKLAND,
AND WITHOUT EXPANDING THE DEVELOPMENT FROM 62 TO 108.9 ACRES?
THAT'S EXACTLY WHAT THREE OTHER DEVELOPER FIRMS PROPOSED TO DO!**

**THE CITY REJECTED THOSE PROPOSALS –
IN A SELECTION PROCESS THAT SHUT OUT CB7,
DESPITE PROMISING CB7 IN WRITING THAT IT WOULD PARTICIPATE.**

Sterling/Related, and their expanded plan which adds the 1.4 million square foot
"Willets West" mall on parkland, were designated by the City administration.

Here are the three proposals that required no parkland mall and no expansion of the project –
and which CB7 was denied the opportunity to participate in evaluating:

Macerich

Features:

- "A True Retail Destination"
- Food & Beverage
- Entertainment
- Housing
- Hotel
- Public Open Space
- Parking
- "A Model Green Community"

Silverstein Properties, Inc. and Taubman Centers, Inc.

Features:

- "Entertainment Corridor & Urban Room"
- 126th Street Retail
- Restaurant Row
- Neighborhood Retail Street
- Eco-Promenade
- 100 percent affordable housing (400 units)
- "A Model Sustainable Community"

TDC Development and Construction Corp.

Features:

- "World Trade Center Queens"
- Hotel
- Restaurant
- Trade Mart
- Convention Center
- Retail Complex
- Entertainment District
- Office Building
- Neighborhood Park

Among the reasons given for rejecting those proposals:

- "Would have required public subsidies." – And yet, Sterling/Related are set to receive public subsidies worth nearly half a billion dollars: 23 acres of Willets Point Phase One property, worth more than \$200 million, for the price of just \$1; a capital grant in the amount of \$99 million to cover numerous project costs, including remediation; and \$20 million in sales tax exemption.
- "Would have required rezoning." – Really? Perhaps rezoning the Willets Point Phase One property would have been preferable to expanding the project to 108.9 acres and adding a 1.4 million square foot mall to be constructed on parkland, with increased traffic impacts. Had CB7 been allowed to participate in developer selection as was promised, it could have expressed a preference to proceed with rezoning instead of expanding the project and sacrificing parkland to include a huge mall, with its untenable traffic impacts.

Development of Willets Point need not depend on constructing a mall on 30+ acres of public parkland, and need not expand beyond the boundaries of the 62-acre Special District established in 2008.

Deny the present application of Sterling/Related. Make the City publish a new Request for Proposals, and insist that the City fulfill its written commitments to include CB7 in the developer selection process. In that way, CB7 can do its part to ensure that proposals of all developers – not just those who have special access to property beyond the boundaries specified within an RFP – are fairly considered.

Re: Willets Point Development Project

Dear Dr. Kulikowski:

I am writing on behalf of Willets Point United and individual members thereof to provide these comments on the Draft Supplemental Environmental Impact Statement (DSEIS) for the Willets Point Development Project, CEQR No. 07DME014Q.

Traffic Impacts

Neither the Executive Summary nor the text makes clear (as they should) the magnitude of the traffic disruption that would be caused by the project at full build-out. However, a close examination of the tables in the DSEIS uncovers a disturbing picture. For example, in the year 2032, under the "no action" condition the average speeds on the westbound Grand Central Parkway between Roosevelt Avenue and the Long Island Expressway on non-game days would be 48.1 mph during the weekday morning run, 43.0 mph during the weekday midday, and 37.7 mph during the evening rush. (DSEIS Table 14-69, page 14-106.) If the project is built (including the Van Wyck ramps), the average speeds during those same periods on non-game days would be **6.7 mph, 0.0 mph, and 0.4 mph**, respectively. (DSEIS Table 14-75, page 14-119.)

In order for the reader to comprehend the implications of these sorts of speeds, the FSEIS (as previously requested) should calculate the travel *time* from one end of the studied segment to the other (i.e., between Roosevelt Avenue and the Long Island Expressway on the Grand Central Parkway). The CEQR Technical Manual neither mandates nor prohibits this kind of analysis; SEQRA and CEQR demand that decision-makers be provided with information sufficient to make informed decisions. The meaning of a 0.0 mph speed on a highway should also be explained. The FSEIS should also explain the impacts of these speeds (or, during the 0.0 mph condition, this stationary condition) on emergency response times and on airport access.

Robert R. Kulikowski, Ph.D.
July 17, 2013
Page 2

The DSEIS mentions a variety of mitigation measures but does not commit to them. If these mitigation measures are undertaken, the DSEIS projects speeds in 2032 under the “build” condition of up to 48.8 mph during the morning rush and 48.1 mph during the evening rush, but they would still be at 6.7 mph during midday. (DSEIS Table 21-21, p. 21-50.) The same pages show terrible traffic conditions for many other mainline intervals and intersections in 2032.

The mitigation to accomplish this would involve, among other things, adding lanes to various access roads. Pp. 21-27 - 21-29. It is highly speculative whether this could be done. Adding lanes would require acquisition of additional real estate and a variety of state and city approvals, in addition to additional environmental review and, presumably, condemnation. Even with this, the DSEIS concedes that many of the projected conditions cannot be mitigated. Pp. 21-4, 21-20, 21-31.

In 2032 on non-game days, if the project is not built, the number of signalized intersections with Level of Service F would be 1 during the weekday morning peak; 4 during weekday midday; 2 during the weekday evening peak; and 3 on Saturday midday. If the project is built, those numbers become 9, 12, 15, and 13. (Table 14-55, p. 14-84.) Numerous intersections cannot be mitigated at all. Pages 21-4 - 21-5, 21-19 - 21-21.

If the City approves the project, the SEQRA Findings Statement will have to explain why it is acceptable to undertake a lengthy and expensive action that will result in traffic speeds of 6.7 mph, 0.0 mph, and 0.4 mph on one of the City’s major arteries. If reliance is placed on the lane-widening and other mitigation measures, then 1) those measures should be explained in detail, 2) their collateral consequences (e.g. condemnation of real property and consequent loss of housing and jobs) should be enumerated, and 3) they should be committed to.

The traffic impacts may actually be more severe than revealed in the DSEIS. The reasons for this are set forth in the comments of Brian Ketcham, which are incorporated herein by reference. To pick one notable example, it appears that the DSEIS uses trip generation factors that are considerably lower than real world experience with comparable uses would show are appropriate.

Ramps

The City still refuses to disclose anything about the cost of the Van Wyck ramps, though they say the City has agreed to pay for them (Response to Comments p. 32).

It appears that the traffic methodology used for the DSEIS was similar to that employed by the City in the original FEIS. That FEIS also projected terrible traffic

ARNOLD & PORTER LLP

Robert R. Kulikowski, Ph.D.

July 17, 2013

Page 3

consequences, though not nearly as bad as those in the DSEIS (at least in part because of the considerable enlargement of the project). The City then abandoned that methodology when it prepared an Access Modification Report (AMR) in its successful effort to persuade the State Department of Transportation and the Federal Highway Administration to approve the Van Wyck ramps. Now the City is going back to its original methodology. In view of this new information, the prior approvals by the State DOT and the FHWA are invalid, and those agencies need to undertake a fresh review under the National Environmental Policy Act.

My comments of September 27 on the draft scope for this DSEIS stated, "The City has a history of releasing wildly contradictory reports about the traffic impacts of this project, without ever clearly explaining the reasons for these discrepancies. The supplemental EIS should include a table comparing the assumptions, methodologies and other inputs of the traffic study used there and all the prior traffic studies for this project, so that readers can understand the differences and draw their own conclusions as to which, if any, is valid." The DSEIS failed to include this table. The FSEIS should include it.

Mass Transit Impacts

The tables in the DSEIS (though not the text, except euphemistically) reveal that conditions within the Mets-Willets Point No. 7 subway station would also become horrible; especially the stairs from the Roosevelt Avenue entrances down to the mezzanine. Conditions in 2032 on non-game days without the project show a Level of Service A for these stairs (Table 14-111, p. 14-156); in 2032 with the project, the Level of Service is E+ for one staircase and D+ for two. (Table 14-141, p. 14-187.) The DSEIS says that wider staircases could help alleviate this condition, but that it is not clear whether this would be feasible, there is no indication of how much they would cost or who would pay for them, and they are not committed to (p. 14-189, 21-57).

The DSEIS says that in 2032 with the project built, on the Manhattan-bound express #7 train, the volume/capacity ratio would be 1.20, and the available capacity would be -3,673 (minus 3,673). In other words, the subway would be able to carry 3,673 *fewer* people per hour than want to take it, even with the subways running at the maximum capacity that the signal system will allow. (Table 14-143, p. 14-190.) In order to alleviate some of the subway crowding, the DSEIS suggests providing more LIRR service there (p. 14-156). Again, there is no discussion of whether this is feasible, what it would entail, or how much it would cost, and there is no commitment to do it.

ARNOLD & PORTER LLP

Robert R. Kulikowski, Ph.D.

July 17, 2013

Page 4

Relocation

The DSEIS still does not identify relocation sites for the remaining businesses that have not agreed to sell. The Response to Comments on the Draft Scope (p. 20) says the City is still working on this, but there is no indication that any progress has been made for the last several years.

The original EIS assumed that all the businesses could be readily relocated. Five years later, relocation sites have not yet been found for my clients and others. The supplemental EIS must acknowledge this reality.

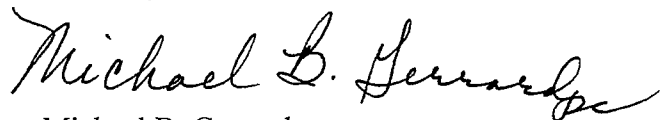

The City rejected my request to study an alternative that looks at the project without any eminent domain (pp. 51-52). This alternative should have been studied, for only that way can the reader understand whether or not this condemnation is truly necessary. The possibility of leaving untouched any properties whose owners will not sell voluntarily becomes more feasible in view of the City's new plan to use much of Willets Point as a parking lot.

Other Comments

The DSEIS does not satisfactorily address the comments raised by a number of commentators that the land that the City acquired for park purposes cannot lawfully be utilized for a shopping mall and associated parking, in particular that there is no, or insufficient, legislative authorization to abrogate the public trust doctrine in this instance, and that the Administrative Code does not permit the City to sell or lease the parkland at issue to construct a mall.

A major rationale for the City's insistence that the entire project be done at once, without phases, was that soil contamination all needed to be remediated at once. The City has now decided to adopt a phased approach. The FSEIS should explain this change in position, and how it envisions that contamination will be addressed on a phased basis. If phasing is now possible, the FSEIS should consider an alternative in which certain properties (especially those being acquired from private parties) are excluded from the early phases.

Sincerely,

Michael B. Gerrard

Submission by Brian T. Ketcham, P.E., July 10, 2013
to the City Planning Commission regarding the evaluation of the Willets "West" Mall/Willets
Point Development Plan

I am a transportation and environmental engineer. For the last four years I have been assisting Willets Point United in discovering the truth about this project. It is these analyses and the lies we uncovered that have delayed this project for more than three years.

I am writing to encourage the New York City Planning Commission to reject this project. There are good reasons for doing so:

1. NYCEDC claims that by adding the Willets "West" Mall they will actually reduce traffic congestion—this is a preposterous claim; the Willets "West" Mall will make traffic congestion far more severe than what was reported in the WP FGEIS.
2. The plan is too big for the area; Willets Point is surrounded by what are already the nation's most congested expressways; the Willets "West" Mall/Willets Point Project will only make condition's worse.
3. Project impacts reported in the SDEIS are extremely severe and it is unlikely many can be mitigated.
4. Mitigation for expressways is not described in the SDEIS; major changes to expressways take years and require their own individual engineering and environmental assessments delaying project implementation.
5. Proposed mitigation still leaves intersections and expressways gridlocked; this is especially true for Astoria Blvd., Northern Blvd. and Roosevelt Avenue.
6. The SDEIS low balls the number of trips this project will generate; a great deal more traffic will in fact be produced than reported further gridlocking the area.
7. For example, the SDEIS reports that less than 60% of shoppers will use autos to access the site; today 85% of Queens's shopping trips are by auto; 95% of shoppers to large malls arrive by auto; for destination retail the SDEIS under reports auto trips by 50%.
8. Destination retail would be responsible for more than half of total trips reported for this project; there is no justification for nearly 2 million square feet of new destination retail in the Willets Point area.
9. The project proposes relatively little parking for the size of the project; proposed parking cannot accommodate parking demand; spillover traffic will intensify gridlock conditions.
10. The project relies on substantial public transit service; there is no way the MTA can meet proposed transit demand; the No. 7 line will be gridlocked if this project is built; commuters will face huge delays.
11. The Willets "West" Mall will add another 28,000 car and truck trips to the 80,000 reported in the FGEIS adding 61 million miles of travel each year in proximity to the project increasing traffic accidents by 496 and costing motorists and the surrounding communities nearly \$40 million each year in increased health care and property damage costs.
12. The addition of 61 million miles of vehicular travel produces considerable externality costs, not just traffic accidents costs but the health costs of added air pollution, traffic noise, water pollution and so forth. These costs are not trivial: for full Willets Point build out including

the Willets “West” Mall these costs total \$120 million every year—costs that are far greater than any benefits provided to NYC by the Willets Point project.

13. Assuming the assumptions reported in the SDEIS are correct (and we do not believe they are) total project build out will generate 194 million added vehicle miles of travel, increase traffic accidents by 1,578 at a cost to motorists and Queens residents of \$124 million annually; externality costs for total build out including accident costs in 2032 would total \$382 million annually.

Attached are more details about what is wrong with the SDEIS and what information is still needed by the City Planning Commission to make an informed judgment about this project. Just remember, once the full Willets “West” Mall/Willets Point Project is completed the area will suffer extreme congestion levels that cannot be mitigated.

BRIAN KETCHAM ENGINEERING, PC

175 Pacific Street, Brooklyn, NY 11201, 718-330-0550, btch@konheimketcham.com

QUESTIONS THAT MUST BE ANSWERED IF NEW YORK CITY PLANNING COMMISSION IS TO FULLY UNDERSTAND THE TRANSPORTATION IMPACTS OF THE PROPOSED WILLETS “WEST” MALL/ WILLETS POINT DEVELOPMENT PLAN

I have been asked by Willets Point United (WPU) to comment on the transportation component of the Supplemental Draft Environmental Impact Statement (SDEIS) for the proposed Willets “West” Mall/Willets Point Development Plan. The following comments refer to the SDEIS and to related documents listed at various web sites.

My name is Brian T. Ketcham. I am a licensed Professional Engineer, licensed in the State of New York. I am currently retired. Before retiring I worked for more than 4 decades on various transportation engineering projects. I still operate Brian Ketcham Engineering, PC, assisting low and moderate income communities in analyzing proposed projects and holding developers and government officials accountable for compliance with environmental laws and regulations. My most recent project is the Willets Point Development Plan, in which I performed detailed technical analyses. I have participated in dozens of other similar projects, some as large as Willets Point. I also was Vice President of Konheim & Ketcham, a full service environmental engineering firm with projects for the New York State Thruway Authority, the New York State Department of Transportation and the New York City Department of Transportation, among many other agencies and private clients, for which we prepared full environmental impact statements along with detailed traffic plans and models. K&K was closed at the end of 2006. I was also Executive Director of Community Consulting Services over twenty years during which we undertook hundreds of projects supporting low income communities on a pro-bono basis, providing more than 65,000 hours of free engineering services on projects like the Atlantic Yards project in Brooklyn and Hunts Point in The Bronx. Before this I was Executive Director of Citizens for Clean Air, an organization responsible in the 1960's for New York City's clean air programs and for bringing the first law suit against the Westside Highway Project in which the federal courts denied the City, State and federal government's permits to proceed with this project in 1975. This was the first and last time such a suit was undertaken against so large a highway project and was actually won in the public's interest. The Westside Highway Project was again defeated two years later when NYCDEC refused, based on my demonstration in evidentiary hearings, to again issue a permit for the construction of Westway. And before this I was director of the Bureau of Motor Vehicle Pollution Control for the New York City Department of Air Resources. For this organization I set up a new emissions test facility which, in 1971, had more cars equipped with catalytic emissions controls than the entire world's automotive industry. Along the way I built (as a private citizens and at my own expense) a three-way catalyst equipped car demonstrating we could meet Clean Air Act emissions standards and improve fuel economy, showing the Congress of the United States that if two young engineers using their own funds to accomplish what the auto industry said could not be done,

certainly auto makers with billions of dollars in resources could at least match what we could do. The result was that Congress did not cave in to demands by auto makers to extend or relax emissions control deadlines. Finally, I was asked by the New York State Department of Environmental Conservation and the United States Environmental Protection Agency in 1972 to prepare New York's Clean Air Plan required by the 1970 CAA. I completed this work in less than 9 months meeting the stringent federal requirements. New York's Clean Air Plan is the most comprehensive transportation plan that has ever been completed for New York City. For this work I was honored in 1993 by Mayor John Lindsay as the most effective manager in New York City government under the age of 35.

The following are examples of what is wrong with the SDEIS supporting this project. More problems and questions will be identified over the coming months.

NYCEDC CLAIMS THEY CAN MITIGATE 65% OF WILLETS POINT TRAFFIC IMPACTS WITH THE ADDITION OF WILLETS "WEST" MALL. THIS IS NOT TRUE.

The developer has reported he will add another 1.4 million square feet of shopping mall/entertainment facilities to the already oversized Willets Point Development project. The developer claims he will actually reduce the impact of this added traffic on the severe congestion along access roads and on nearby expressways already reported in the Willets Point FGEIS. According to the FGEIS the 11 million square feet Willets Point project will add 80,000 car and truck trips to the project area producing "significant" impacts at 78% of all intersections analyzed. Adding Willets "West" Mall will increase project traffic by about 25% impacting even more severely nearby intersections, expressways and expressway entry/exit ramps creating even worse congestion than reported in the FGEIS. Mitigation including the public expenditure of tens of millions of dollars on traffic improvement measures will reduce impacts slightly. However, for many locations full mitigation cannot be achieved and breakdown conditions will prevail. LOS F is reported at many mitigated intersections—for full intersections (many that cannot be mitigated at all) and/or at many intersections they claim to mitigate that retains one or more intersections approaches that remain LOS F or worse. This is what was reported in the FGEIS for Willets Point and the addition of the Willets "West" Mall will make these conditions worse. To claim that adding the Willets "West" Mall will actually make traffic congestion along access roads and on expressways and expressway access/egress ramps is simply not true—it is a lie intended to trick the host community and the New York City Planning Commission into accepting this new project. The consequences of building a 13 million square foot development in so isolated a site will have consequences far beyond the illusion provided by NYCEDC and the developers (see more below).

THE DEVELOPER MUST EXPLAIN THE CONSEQUENCES OF LEAVING MOST INTERSECTIONS ALONG MAJOR ACCESS ROUTES TO WILLETS POINT IN GRIDLOCK CONDITIONS AFTER APPLYING ALL AVAILABLE MITIGATION

The SDEIS reports operating conditions at approximately 30 key intersections affected by the Willets Point project. While relatively few intersections are examined in the SDEIS, project impacts are clear: adding 8,000 to 10,000 hourly car and truck trips to peak travel hours will impose severe restrictions on travel. This can be seen by examining Table 14-59 which shows

project impact for virtually every intersection examined in the SDEIS. More detail can be found by looking at the data presented in Table 22 from Chapter 21 on mitigation.

A review of all results for peak hours with available mitigation shows that during evening peak hours, access roads to Willets Point (Northern Blvd., Roosevelt Avenue, Astoria Blvd.) will be gridlocked. Table 21-6, which I have marked up and attached, shows how severe the developer will leave these major access arterials to Willets Point. With all the mitigation the developer can muster he leaves critical intersections with overall average vehicle delay of 100 to 200 seconds. And these conditions do not get any better on Saturday. Table 27 illustrates the point for a couple of critical intersections. While Table 22 shows some locations along these access roads can be fully or partially mitigated, the community is still faced with gridlock traffic conditions with cars facing two or three signal cycles to move through an intersection with traffic spilling back into adjacent intersections. Certainly the developer has modeled this condition. But he does not provide or describe the results.

Again, looking at Table 22 for 126th Street at Roosevelt Avenue and 34th Street, we find a number of intersection approach movements at LOS F, with delays of between 100 to more than 800 seconds. These are the major entry points to the Willets Point Development. Project traffic creating huge delays will create a huge impediment to the operation of Willets Point and will be of even greater consequence on a METS game day. And, of course, these conditions are only for “average” days not Fridays. Destination retail will experience 19% more traffic or days in December when traffic will be 42% higher than reported. How can the developer justify so large a project with the horrible traffic conditions reported in the SDEIS that cannot be mitigated? And, because we think the developer has under reported trip generation, traffic conditions will be worse than reported.

For example, the complexity of the Roosevelt Avenue/126th Street intersection – a main entry point into the Willets Point project – is not discussed in any detail (this problem is mentioned briefly). How do the columns supporting the overhead No. 7 transit line impede the efficient movement of traffic or reduce sight distance and thus affect safety? As noted elsewhere, the City Planning Commission needs intersection expressway drawings to make this review more effective.

When faced with breakdown conditions in all directions can the developer honestly say that this project will not create huge traffic delays along access roads spilling back onto the surrounding expressway system even with all the mitigation that he can dream up? Can he not admit that this project will have a huge negative effect on this community, imposing greater traffic delays, more traffic injuries and deaths and other costly externalities borne by the million motorists already passing by Willets Point each day on nearby expressways and arterials even with his most optimistic assumptions?

THE ENVIRONMENTAL ASSESSMENT FOR THE VAN WYCK RAMPS MUST BE UPDATED/REVISED

Why did not NYCEDC and/or the developer revise the Environmental Assessment (EA) for the Van Wyck ramps? The SDEIS reports the Willets “West” Mall will be adding about 28,000 car and truck trips to the WP area (and a great deal more if their assumptions are wrong) for average weekdays. Adding the Willets “West” Mall traffic results in significant differences in

background traffic that will affect travel conditions with the ramps. These trips, as many as 3,000 an hour entering or leaving the Willets “West” Mall, will get onto nearby expressways affecting the baseline conditions examined to determine the environmental impacts of the Van Wyck ramps to be constructed. The SDEIS itself reports that the Willets “West” Mall will produce significant traffic impacts on surrounding expressways requiring costly mitigation (should funds be available) (SDEIS Page 21-27). The EA must be updated.

WHAT GUARANTEE CAN THE DEVELOPER PROVIDE THE COMMUNITY THAT THE MTA CAN ACCOMMODATE WP TRANSIT DEMAND?

The developer is relying on the MTA to provide additional bus service to the WP “West” location. WP “West” Mall will produce about 14,000 additional bus riders on an average weekday. At 56 people per bus (capacity) that would require the addition of 250 weekday buses (most spread out from 10 am to 8 pm). What guarantee can the developer provide that the MTA can provide this level of added bus service?

At the third meeting of the Building/Zoning Committee of Queens CB7 the developer mentioned that they were working with the LIRR on using that service to provide some relief for the overcrowding their project will create on the No. 7 subway line. Has the developer analyzed the potential for utilizing the LIRR? If so, what have they found? And, how realistic is using the LIRR during peak commute hours?

CAN THE PROJECT EAST OF 126TH STREET ACCOMMODATE NEARLY 600,000 SF OF LOCAL RETAIL AND, IF SO, HOW?

What is the basis for assuming 593,000 SF of local retail east of 126th Street? This assumption appears very high for a project with just 5,850 residences, approximately 12,000 residents (plus workers and others, although local retail is nowhere close to the Willets “West” Mall and entertainment center and additional retail would be redundant for the Willets Point “West” shopping mall). Moreover, assuming stores are 60 feet deep the developer is looking at installing nearly 2 miles of store front space in the original Willets Point project. We don’t think there is enough space for this much local retail. And, with all this local retail using curb space where will 657,000 SF of additional destination retail go if all frontage is occupied by local retail? So, what’s the point of so much local retail? Considering that just 15% of shoppers are assumed to arrive by auto for local retail we believe this is the developer’s way of hiding auto trips and minimizing traffic impacts. We are convinced that more than half of this “local retail” space will, in fact, end up as destination retail. The SDEIS must be revised to account for this worst case condition. See Table 4, attached, that reports the impact on travel.

WHAT IS THE BASIS FOR ASSUMING JUST 59% OF DESTINATION RETAIL SHOPPERS WILL USE AUTOS TO ACCESS THE SITE?

A comparison of the rates used in the SDEIS with those reported in the 1991, 2001 and 2012 CEQR Technical Manuals shows little change in trip generation rates over this period. We know that many of the assumed trip generation rates date to the Regional Plan Association that did counts in the early 1960’s in Manhattan. How can the developer justify using these antiquated rates especially outside Manhattan? The CEQR Technical Manual advises that if rates are over 3 years old the developer should take counts at representative locations. WPU has repeatedly

requested that the developer undertake such counts. For a project of this size with the severe traffic impacts that the developer has reported in the SDEIS how can they continue to rely on ancient data? We believe that the rates used in the SDEIS significantly under report traffic impacts.

For example, take Willets “West” Mall: The developer assumes that 59% of shopping trips will be made by auto with the rest by walking or transit. This number appears incredibly low when compared to other isolated shopping malls like Gateway Plaza in Brooklyn or Palisades Mall in West Nyack, both of which exceed 95% of shoppers arriving by auto; and both of which provide double the parking per 1,000 SF of retail space. The developer must provide its source justifying this 59% assumption. Would it not be wise to plan for higher auto use in so isolated a site, especially in Phase 1 of this project? The consequences of under reporting auto use on parking and traffic are very significant to this community.

The effects of using reported auto use for isolated destination malls compared to 59% are striking. Tables 1 and 2 (attached) provide a comparison. Table 1 reports the data provided in the SDEIS for Phase 1A. It shows that average daily vehicle trips for Phase 1A would total 28,524 with destination retail making up 81% of this total. Table 2, assuming 90% of shoppers at destination retail arrive by auto, shows an increase in total average daily car and truck trips of 39,345 with destination retail responsible for 86% of total. Table 2 reports a 38% increase in the number of trips from just this one reasonable change, increasing shopper trips to destination retail from 59% to 90%. Vehicle miles of travel would increase by 36% to 83 million miles of vehicular travel annually, from 61 million estimated using SDEIS assumptions.

Another hypothetical, along these same lines, is presented in Tables 3 and 4. Table 3 reports total vehicle trip generation for full project build out, Phase 2, (again for an average weekday) of 87,532 trips, with destination retail producing 50% of this total. However, we dispute not just the use of 59% for shoppers accessing the Willets Point site by car; we dispute the total amount of local retail (there just does not appear to be enough space to accommodate even half what is proposed as discussed above). Table 4 assumes that for Willets Point “West” we stick with 90% of shoppers accessing destination retail by auto (it is an isolated site with poor transit access). However, we assume that for destination retail east of 126th Street 80% of shoppers will arrive by auto. We also assume that the additional local retail proposed for Phase 2 is assumed to be destination retail. The result is an overall increase in average weekday vehicular travel to 109,386, an increase of 21,864 trips, and an increase of 25%. This is a conservative adjustment. We have not tinkered with other trip generation assumptions, most of which do not have supporting documentation.

THE DEVELOPER HAS OVERLOOKED WORST CASE TRAFFIC CONDITIONS

The SDEIS reports average weekday and average Saturday traffic impacts. Not disclosed are the weekly and seasonal variations. For example, the Institute of Transportation Engineers *Trip Generation Manual* reports that for shopping malls Friday traffic is 19% greater than weekly averages and for Saturday, 51% greater. It also reports that Decembers produce 42% more traffic during the month than for annual averages. None of this is reported in the SDEIS although WPU has repeatedly brought this issue to NYCEDC’s attention (and, allegedly, the SDEIS is claiming to “report” “worst case” conditions). Were these differences to be accounted

for you would find true “worst case” conditions would be significantly worse than reported. Parking would also be significantly over-capacity. Surely your traffic engineers understand these effects. Annual average project impacts are severe enough. What can we expect when auto trips are half again higher, holiday effects kick in and parking supply is good for only half of demand? This condition has to be accounted for.

THE DEVELOPER IS NOT PROVIDING ADEQUATE PARKING FOR THIS PROJECT. PLUS THE SDEIS MANIPULATES TEMPORAL ASSUMPTIONS TO MINIMIZE PEAK HOUR PARKING DEMAND.

As suggested by what has already been said, parking is critical. Yet, the developer is providing half what other similar locations are providing. The developer appears to justify this on the basis of extremely optimistic trip generation rates and the heavy use of public transit that really does not exist. Could this project be built if the developer had to provide double the number of parking spaces promised? Can the developer provide this community a guarantee that, should our worst fears come to pass, that parking is not adequate, that they will actually build additional parking garages to supplement the meagre supply of parking promised?

As noted above, experience elsewhere at large malls suggests not only that they attract many more auto trips per 1,000 square feet of retail space, but they typically provide double the number of parking spaces per 1,000 square feet of retail space than is being provided at either the Willets “West” Mall or for the destination retail proposed for Phase 2 of the project. These differences must be addressed by NYCEDC and the developer.

Also, on Table 14-39 the developer loads 15% of daily destination retail travel onto the weekday 1 to 2 pm hour, moving a substantial amount of traffic away from peak travel hours. Tables 14-50 and 14-60 are consistent with this assumption. What is the basis for this assumption? It does not agree with ITE numbers for large shopping malls. What is the basis for all parking temporal characteristics for all land use types? The developer’s source is “Based on travel demand estimates.” That “source” is not good enough. This needs explanation! Has the developer done surveys for parking conditions at other locations and, if so, can he provide the raw data to Willets Point United and to the City Planning Commission? The developer must provide documentation justifying the assumptions made for hourly parking arrivals and departures for the eight land use types evaluated in the SDEIS.

THE DEVELOPER HAS LEFT OUT THE LONG ISLAND EXPRESSWAY IN HIS EXPRESSWAY ANALYSIS

Why did the developer not include the LIE in his traffic analysis? They assign about a sixth of WP traffic to the LIE (and a third of WP traffic to the Van Wyck Expressway). The LIE is already one of the ten most congested roads in the entire United States (so is the Van Wyck and the Grand Central Parkway). The GCP is also not included in the SDEIS, at least that portion of the Grand Central south of the LIE where NYSDOT engineers report it cannot take “one more new vehicle trip from the WP project” even after they spend \$1 billion realigning that expressway near the Jackie Robinson Parkway. Both will be heavily impacted by the expanded Willets Point project (another 28,000 daily car and truck trips from what was examined in the FGEIS). Both should be examined in a revised EA for the Van Wyck ramps.

What is equally incredible is that expressway data are totally missing from the SDEIS; internal site specific traffic movements for the WP project are no longer provided as well. How does NYCEDC expect anyone to evaluate the SDEIS when the traffic network has been simplified so greatly, removing critical data that was originally provided in the FGEIS? This, by the way is how the developer can claim they are mitigating a greater number of intersections—they simply eliminate those reported in the FDEIS and presto, you have fewer affected intersections. It is all a game!

Still, Chapter 21 on mitigation provides considerable insight on project impacts and how hard it is to mitigate so large a project as Willets Point. Table 21-23 attached shows the significant impact for Phase 2 for an average weekday with no games underway. It shows that, while some improvements can be made (very little is described about what, precisely, mitigation involves) it also shows the traffic mess that is left. Table 21-24, also attached, just reaffirms the huge region wide impact the Willets Point project will impose on the surrounding residential communities as well as on the million or so daily motorists who try to thread their way north and south, east and west. The impacts are severe and the SDEIS provides little confidence that much real mitigation can be accomplished and reinforces the communities concern of the mess the developer will leave behind.

THE SDEIS HAS NO DRAWINGS OF EITHER INTERSECTIONS OR EXPRESSWAYS AND RAMPS SHOWING HOW THE DEVELOPER PLANS ON MITIGATING IMPACTS

With the exception of one location we cannot find detailed descriptions of what mitigation the developer is proposing for various expressways or expressway ramps. No description, no drawings. How can the City Planning Commission assess this project without more detail? The developer must provide drawings illustrating each mitigation location. Written descriptions are too brief and just not good enough for public review. And, the 2-point type used in the summary sheets is not legible!

Much of the mitigation proposed in the SDEIS requires the preparation of a site specific Environmental Assessment along with traffic analysis and engineering drawings all subject to NYSDOT and FHWA approval. Each action requires new counts specific to each location. Many of these EAs take from 3 to 10 years to complete and get approved. I have been involved in dozens of these traffic improvement studies – some have taken two decades and 3 or 4 full detailed revisions costing \$10's of millions – more than half these projects never materialized. The SDEIS warns of this problem on page 21-29: mitigation "...measures that may call for detailed review by both NYCDOT and NYSDOT...if these mitigation measures are modified or rejected by the review agencies, significant adverse impacts identified above would be unmitigated." What guarantees can the developer provide that the WP project will not experience the same delays and what impact would that have on project completion schedules? And what if the developer cannot mitigate traffic impacts as promised repeatedly in the SDEIS? What guarantee does the WP community have that this developer will not just gridlock this community 24/7?

And, who is going to pay for mitigation? Including intersection expansion plus modifications to expressways and ramps (plus \$70 million for just the Van Wyck ramps) we are looking at

hundreds of millions of dollars in reconstruction. Is the developer expecting NYC taxpayers to foot this bill?

The developer must provide maps showing vehicular trip assignments by land use type for new no-build construction and for full build out trips including the local project road network. The developer must also provide maps showing traffic volumes along all expressways and expressway ramps on which all Willets Point vehicular trips have been assigned with and without WP Phases 1A, 1B and 2.

THE EFFECTS OF WILLETS POINT ON TRAFFIC ACCIDENTS HAVE BEEN IGNORED. THEY ARE SIGNIFICANT

The FGEIS for the Willets Point Development Plan reports that the project will add 80,000 car and truck trips a day, 365 days a year, generating 116 million additional miles of travel annually. Based on NYSDOT traffic accident rates for NYC the WP project will thereby increase auto and truck accidents by 944 a year including 2 dead and 316 injured. Including the cost of property damage the cost to motorists and society total \$41 million in 2017. Adding another 28,000 car and truck trips a day for the Willets “West” Mall will increase this number to 1,578 crashes annually with 3 dead and 528 injured and approximately 2,500 more cars and trucks damaged. The total cost of the combined effect of Willets “West” Mall and the Willets Point Development Plan in 2032 would be \$124 million annually. And this is only part of the cost of adding daily 108,000 more cars and truck to Queen’s roads. See Table 5 for more detail.

THE ADDITION OF WILLETS POINT TRAFFIC PRODUCES HUGE EXTERNALITY COSTS. THEY CONTINUE TO BE IGNORED BY NYCEDC. IT IS TIME THEY WERE ACKNOWLEDGED

It was earlier demonstrated that the Willets Point Development Plan will produce 80,000 more car and truck trips a day generating \$156 million in externality costs annually. The external or hidden costs to motorists, their passengers, and visitors, residents and workers of the area due to increased vehicular use by travel to and from the Willets Point project include the costs of lost travel time, physical injury, health effects, noise impacts, damage to our roads and utilities. Other costs are paid through taxes such as the control of water pollution, oil spills, greenhouse emissions, the lost value of highway land removed from tax rolls, and, most apparent today, the foreign policy and defense costs of protecting the supply of imported oil (why did we spend a trillion dollars in Iraq?). These harms to society and to households and to the general economy are not well recognized by the public because they increase by a small margin with each added mile of travel and because they are spread among the entire public, both vehicle users and non-users, buried in items such as lower productivity, higher consumer prices and higher insurance costs. But taking them together, even using a low range of vehicle related costs due to the Willets Point project car and truck use greatly reduce the realistic local economic benefits of the project. The costs are based on the well-documented costs per vehicle of mile travel published by the Victoria Transport Policy Institute (VTPI)¹ as well as independent cost accounting that I have undertaken over the last three decades. For this report, the most conservative (i.e., lowest) results have been reported for the social costs of the Willets “West” Mall and the total build out

¹ Litman, T., “Transportation Cost and Benefit Analysis, Techniques, Estimates and Implications,” Tables 6, 7 and 8, Victoria Transport Policy Institute, June 2003, www.vtpi.org/htm.

of the Willets Point Development Project including Willets “West”. The addition of Willets “West” Mall’s 28,000 daily car and truck trips would increase total externality costs to \$382 million a year, an increase of \$120 million just for Willets “West” Mall alone. These totals significantly exceed any benefits of these projects to the communities in and around the Willets Point area. And this does not account for the billions of dollars in public tax payer assistance to the developer, more than a half billion of which has already been spent. A full cost-benefit analysis must be completed for this project before any action can be taken. Without a fully vetted cost-benefit analysis neither the NYCDCP, the City Planning Commission nor the City Council can, in good conscience, act on this project. See Tables 6, 7 and 8 for details.

THE CEQR TECHNICAL MANUAL IS NOT THE “HOLY BIBLE” FOR PREPARING ENVIRONMENTAL IMPACT STATEMENTS

In projects like Willets Point as well as during the recent Queens CB7 Building/Zoning Committee meetings, the CEQR Technical Manual has been cited as the “bottom line” in preparing environmental impact statements. It is not! It is a guideline and developers can and should go beyond the minimal requirements spelled out in the Technical Manual. Preparation of the manual was a collaboration between AKRF and the NY City Dept. of Planning. The objective was to create a process that would best facilitate project approvals with the least effort on the part of developers. For the last two decades it has worked brilliantly to accomplish this goal. The CEQR Technical Manual recommends conservative (optimistic) assumptions that are presumed to be gospel by consultants like AKRF. One example is the selection of trip generation characteristics for traffic projections. The numbers recommended in the Technical Manual date from two to three decades back in time when demographics and travel behavior were very different from today. These are the same numbers used in the FGEIS and now in the SDEIS to under report traffic impacts. In recognition of this problem in 1977 the USEPA provided NYC with a million dollar grant to assemble up to date trip generation data. The City assembled consultants like me to voluntarily contribute what they had collected in the field for various land uses. However, after about 6 months it became obvious that the City had no intention of assembling this data; that they were assuming the consulting community would do this for free. The program quickly fell apart. What happened to the million dollars is unknown but no up-to-date trip generation factors for NYC ever materialized. The lowest common denominator should not be the bottom line for this project.

PUBLIC PARTICIPATION IN THE WILLETS POINT ENVIRONMENTAL ANALYSIS IS A FARCE

Over the past five years more than a thousand pages of comments have been generated on the FGEIS, the Access Modification Report, the Phase 1 Report, the Van Wyck Ramp EA and the Final Scoping Document for Willets Point “West”. Thousands of pages containing thousands of comments have had no effect on the outcome of these analyses. NYCEDC, with the help of AKRF, concoct responses to comments that are meaningless: responses that claim that since the comments were not covered in the scope of work or in the CEQR Technical Manual, they require no response, or, if the comment really hits the mark they simply disagree with the commenter. It is all BS and it is intended to frustrate and discourage public involvement. This practice has been followed for three decades. Occasionally something really awful is identified that has to be addressed—somehow. For example, in 2010 I met with the FHWA, the NYSDOT, NYCEDC,

and a host of lawyers and laid out problems that were so significant that it forced a two year delay in the Willets Point project while EDC and their lawyers tried to come to terms with what we disclosed. What did we find? That EDC with the help of AKRF was lying about the project. Presenting one story in the FGEIS and another in the Environmental Assessment for the Van Wyck Ramps. They were also lying about project impacts, hiding traffic volume to under report project impacts. This sad story is all summarized in the 286 page report that I prepared for WPU and that I presented to NYSDOT as part of my testimony on the Willets Point "West" scope of work. It was completely ignored. Very few times over the last five decades have we been able to expose this behavior. The first was the West Side Highway Project or Westway in which I was able to demonstrate to a Federal judge that the consultants were lying about that project. The consultant, Parsons Brinckerhoff, could not explain their work and could not counter my own testimony sufficiently to convince the judge to approve that project. Some of the people representing Parsons Brinckerhoff in that proceeding were the same engineers and administrators who started AKRF in 1982. They lied about Westway and they are lying now about the Willets Point project. I hope WPU can accomplish for Willets Point what I did with Westway 38 years ago.

TABLE 4
WITH MORE REALISTIC % SHOPPERS USING AUTOS
Estimating Total Annual Vehicle Trips for the Willets "WEST" Mall Development Plan
(Based on assumptions provided in the SDEIS)

PHASE 1A (2018) WITH ACTION PARKING

In Phase 1A, the proposed project would provide approximately 2,500 off-street accessory parking spaces to satisfy the projected parking demand due to the development in Willets West and 75 accessory spaces for project demand in the District.¹ As shown in **Table 14-39**, the projected weekday and Saturday peak parking demands for Willets West (1,127 and 2,238 spaces, respectively) is anticipated to be satisfied entirely by the off-street parking facility provided within the site.

Note: Acc = Accumulation																
Source: Based on travel demand estimates																

As shown in **Tables 14-40** and **14-41**, parking demand from development within the District would not be fully accommodated by the 75 accessory spaces on weekdays or on Saturdays. During the Mets off-season, there would be an additional parking demand of 5 to 131 spaces on weekdays and Saturdays. During the off-season when the recreational uses would be in place, the additional recreational accessory parking demand, if needed, would be provided in Lot B, the north lot, or within the Willets Point District property itself to satisfy this demand.

¹ Additional parking spaces may be provided for off-season recreation uses within the District if they are warranted.

Willels Point Boulevard at Northern Boulevard	x	x	x	x	x	x	x
New Willels Point Boulevard at 126th Street	n/a	n/a	n/a	n/a	n/a	n/a	n/a
Roosevelt Avenue at CitiField / Lot B	n/a	n/a	n/a	n/a	n/a	n/a	n/a

Notes: "x" means the intersection would be significantly impacted. n/a means the intersection is new for With Action conditions.

Parking demand for the proposed residential component would be satisfied through on-street and off-street parking opportunities. As in the 2008 FGEIS, it is assumed that approximately 10 percent of residents would use available on-street parking opportunities, which would reduce the need for off-street parking demand by about 300 spaces. Given the anticipated residential demand of 3,101 spaces, approximately 2,800 off-street residential parking spaces would need to be provided. Residential parking demand is typically lowest during the daytime hours when office, community uses, and primary school parking demands are at a maximum. Therefore, shared parking strategies would be implemented and, where possible, office, community, and primary school parking demands would use parking spaces vacated by residents during the daytime hours. This would maximize usage of vacant residential parking spaces during daytime hours and minimize the need for additional dedicated parking spaces for office, community, and primary school uses.

It is expected that the remaining land uses—retail, hotel, and convention center space—could also share common parking areas. However, because peaking patterns among these uses are similar to each other, there would be minimal savings in the number of required parking spaces. Hence, the projected weekday and Saturday parking demands for these uses are based on the sum of the individual peak demands, or approximately 3,050 spaces and 2,900 spaces, respectively. These

they are found to be significantly impacted under the With Action condition, mitigation measures such as those typically implemented by NYCDOT would be further explored to address the impacts, or if no practicable mitigation measures can be identified, the impacts would be disclosed as being unmitigatable.

TRAFFIC—PHASE 2 (2032)

Table 21-5 presents a summary of significant adverse traffic impacts and their ability to be mitigated, and Table 21-6 summarizes the unmitigated traffic study area locations by time period. Details of the intersection capacity results and traffic mitigation measures are provided in tables at the back of this chapter.

**The Case Against a 1.4 Million Square Foot Shopping Mall
In The Citi-Field Parking Lot**

In 2008 the Bloomberg administration declared 62 acres of property located in Flushing to the East of Citi-Field called Willets Point, on which there were located over 200 small auto related businesses, a blight. Auto repair businesses in and of themselves cannot be considered a blight, much like a factory that manufactures soap. To the extent there was blight, it was caused by the City which for decades collected sewer rent from the owners notwithstanding there were no sewers and collected real estate and other taxes without in any way repairing the area's infrastructure.

... The Willets Point plan approved in 2008 was clear and unambiguous. The city would acquire 62 acres in Willets Point either through the voluntary sale by property owners or if need be through eminent domain. The property would then be turned over to a private developer who would construct on the site, retail stores, office buildings, a convention center, a school and luxury housing with a small portion set aside for affordable housing. The developer selected would be required to remove whatever contamination existed on a 23 acre area. There was no mention, I repeat no mention of a 1.4 million square foot shopping mall at Citi Field or any connection to Citi Field.

When the plan was approved in 2008 Bloomberg promised community input in the developer selection process. Bloomberg reneged on this promise, intentionally to keep in the dark a cabal he worked out with the Mets and Related Companies that while there would be several developers interested in the project, the Mets would be selected, and were in fact selected.

Of all the developers interested in the project, only the Mets had access to Citi Field property by virtue of their lease. The Bloomberg cabal envisioned a 1.4 million square foot shopping mall at Citi Field and it follows all the other developers not having access would be shut out. Hence Bloomberg's empty promise of community input in the developer selection process.

The cabal surfaced in 2013 when the Mets and Related Companies sought a change in the 2008 approved Willets Point plan. It sought through ULURP what it called a minor change in the 2008 plan. The change sought was to

change in the 2008 plan. The change sought was to construct on the 23 acre Willets Point site a parking area, something that would be considered minor and not met with much opposition. In fact the change was not minor but major and devious. The parking area has nothing to do with any meaningful connection to the 2008 Willets Point plan, but to enable the Mets to move their Citi-Field parking area to Willets Point and on the vacated Citi Field area construct a 1.4 million square foot shopping mall, something that by no stretch of the imagination had anything to do with the 2008 plan.

The developer selected for the 2008 plan knew it would be required to remove whatever contamination existed in the 23 acre Willets Point area. By accepting the plan, it is clear the Mets knew they would be obliged to clean up the site and it had nothing to do with a Citi-Field shopping mall. Ethan Goodman an attorney for the Mets at a hearing before Community Board 7 stated: "A vote against the plan is a vote against cleaning up Willets Point". Since under the 2008 plan the Mets accepted, they knew they were required to clean up Willets Point without a shopping mall, Mr. Goodman's statement was a scare tactic and misleading.

This was compounded by a additional misleading statements. The Mets now claim they need a the mall to generate a financial engine with which to construct the 2008 plan, this from Wilpon a multi billionaire. If they thought they did not have the financial ability to construct the 2008 plan, why did they bother to bid for it, unless they knew down the line Bloomberg would deliver the mall? And what if the speculation a mall will be a financial success is not, does that mean the financial engine sputters out and the 2008 plan abandoned?.

The Mets failed to point out under the new Bloomberg plan, it will only be required to pay the City \$1.00 dollar, that is right 1.00 for the Willets Point property. The City will also contribute \$99 million taxpayer dollars, of which \$40 million is earmarked for clean up, a sweetheart deal that would make the infamous Boss Tweed tip his hat in admiration. So the claim a mall is needed to ensure Willets Point gets completed, is a lie. Tens of millions of taxpayer dollars were used to acquire Willets Point property and perhaps even more in the future. That this property is being sold to the Mets a private for profit business for \$1.00, on top of which they are getting about \$100 million taxpayer dollars, is not just unacceptable. It is a raid on the city's treasury and the most outrageous governmental malfeasance being perpetrated upon the people of this City in decades, Were this the old West, Bloomberg as the architect of this taxpayer rip off, would be tarred and feathered and driven out of town together with all officials who sit idly by and let it happen.

It is the position of the Mets supported by Bloomberg that since the Mets have a lease on Citi Field, it could pursue any land change it wishes without a ULURP and in fact there is no ULURP pending with regard to the shopping mall. Citi-Field and its parking area are

located on Flushing Meadows Corona Park land and it is the position of the Mets supported by Bloomberg that because of the lease and notwithstanding a radical land use change from a parking area to a huge shopping mall, there is no obligation to replace park land. This is absurd and at least debatable which a transparent Mayor and Park Department would contest and litigate if necessary. Suffice it to say this will not occur given Bloomberg's indifference to FMCP and the less privileged people who need and use the park.

The recent survey which states the acreage of FMCP is not 1,225 as thought, but 897.62 acres, should make it even more clear it is vital that every square inch of the park must be protected.

The Mets claim without them and the mall, Willets Point will never get done. Nonsense. If the Mets walk away, that will demonstrate all they care about is a mall. Other developers will line up to do the job without a mall, and especially with a City contribution of \$99 million. It will get done without the Mets and without a mall. Further proof it is a mall that suddenly becomes paramount is evident from the Mets priority. (1) Clean up the 23 acre site. (2). Build a parking area there. (3). Move the Mets parking area to Willets Point. (4). Construct the 1.4 million square foot shopping mall. Housing goes on the back burner not to be done until 2025, if at all depending upon highway ramps getting built.

The only areas capable of serving the area are Northern Boulevard, Roosevelt Avenue, The Grand Central Parkway and The Van Wyck Expressway, arteries that cannot be enlarged, and are choked to capacity. Ramps to these arteries are akin to the infamous bridge to no where.

Queens has many shopping areas - small, large and malls. Do we really need a shopping mall at Citi Field, one that will cause a traffic nightmare and one that even if it does business it will be at the expense of our long term commercial merchants. If I were a merchant in downtown Flushing, Northern Boulevard or Roosevelt Avenue, I would hesitate to sign a long term lease.

Community Board 7 and 3 pursuant to ULURP rules conducted hearings on the application. Board 7 approved the application 22 to 18, hardly an overwhelming endorsement. Board 3 rejected it by a vote of 30 to 1 with 1 abstention, clearly overwhelming. If we add the votes of Boards 7 and 3, the result is 48 against and 23 in favor, clearly an indication of where the public stands. At a hearing before Queens Borough President Helen Marshall when this was brought out, she claimed the Board 3 vote was irrelevant. She is wrong both under the law and common sense principles. ULURP section 2-3 which permits involvement of other Community Boards makes it clear the relevancy of the Board 3 vote. Board 3 having proceeded pursuant to ULURP, its vote must be considered on an equal footing with that of Board 7 and in deed given its closer proximity

than most of the Board 7 area, even greater consideration.

When a land use change is being sought, relevant to that change is any fallout it may cause. Fallout may be purely local involving a small area or it may encompass a borough wide area. If the corner grocer wants to enlarge a parking area for his or her customers, that would be an example of a minor fallout limited to a small area. A 1.4 million square foot shopping mall which the Mets and Related Companies claim would attract a borough wide area is an example of a borough wide fallout that has great relevancy not just limited to Board 7

It follows both under ULURP and common sense principles, great weight must be given to a disapproval vote of 48 as compared to an approval vote of 23.

The application consists of falsehoods, political back room deals, has no merits and makes a mockery of the ULURP process. It should be rejected making clear the people are the constituents and not a coalition of big business and shady politics.

Re: Willets Point N139220zrq; C130222ZSQ; C130223ZSQ; C130224ZSQ;
C130225ZSQ; Section 124-60

Dear Commission Members:

Please consider this as a supplement to my statement at the July 10, 2013 hearing in connection with the captioned matter.

This Commission should reject the application because it is deceptive, misleading and not in the public's interests.

The Willets Point plan approved by this Commission in 2008 was clear and unambiguous. The City would acquire 62 acres in Willets Point either through the voluntary sale by property owners or if need be, through eminent domain. A real estate developer would be selected with input from the community and the developer selected would then construct on the site, upscale retail stores, office buildings, a convention center, a school and luxury housing with a small portion set aside for affordable housing. The developer would be required to remove whatever contamination existed on a 23 acre area.

There was no mention of a 1.4 million square foot shopping mall at Citi Field or any connection to the Citi Field area. There was no mention the City which paid tens of millions of taxpayer dollars to acquire the property and may well spend many more millions, would sell the property to the developer for \$1.00, which is not a sale but in fact, a give away. There was no mention the City would subsidize the developer to the tune of \$99 million dollars.

Mayor Bloomberg reneged on his promise the community would have input in the developer selection process and the reason has now surfaced. While there were several developers interested in the project they had no chance of being selected because the fix was in, it would be the Mets and its Related Companies which had a lease on the Citi Field property and the ability to construct a huge shopping mall on its parking lots. Had there been community input as promised, the public would have been aware of the shopping mall, the give away of the Willets Point property

for \$1.00 and the \$99 million dollar subsidy. They could have insisted on any one of the other interested developers who would do the plan without a mall.

This deception in and of itself is sufficient to reject the application, but there exists a host of other reasons that warrant its rejection.

1. The amendment to the 2008 plan claims to seek a “minor” change, to wit: to have constructed on the 23 acre Willets Point area, a parking lot. Clearly a parking lot would be “minor” and unlikely to face much if any opposition. With due respect in making a decision on a matter before it, this Commission has the obligation to take into account not just any fall out of an approved application may cause, but even more importantly, whether the application’s underlying basis is legitimate and not a cover up for some other project. In the application in question, it is clear beyond any doubt, the change sought, is not “minor”, but “major”. The reason behind a Willets Point parking lot, would be to enable the Mets and their Related Companies to transfer the Mets Citi Field parking lot to Willets Point, thereby making the vacated area available for a 1.4 million square foot shopping mall. It is a mall which has nothing at all to do with the 2008 approved Willets Point plan that is the elephant in the room; that is what this application is deceptively all about, and warrants its rejection.

2. Under the 2008 plan which the Mets and its Related Companies bid for and were selected, they were aware and agreed they would be required to remove whatever contamination existed on the 23 acre site. The current claim that without a mall, the contamination would never be accomplished, the Willets Point plan at a dead end, is nonsense. If they wish to walk away other developers would line up to accept the property for \$1.00 with a \$99 million dollar subsidy and do the job without a mall.

3. The claim the Mets, their Related Companies and owner the multi billionaire Fred Wilpon, must have the mall to generate a financial engine with which to construct the original Willets Point plan, is more nonsense. If they did not have the financial ability to construct the 2008 plan to begin with, why did they seek to be the developer? As aforesaid other developers were prepared to do the job without a mall. Furthermore, there is no guarantee a mall would be a financial success. Does that mean if the financial engine sputters out, Willets Point also sputters out?

4. An integral part of the 2008 Willets Point plan was housing. Adding to the deceptiveness of the application is the priorities the applicant intends to pursue.

a) Remove the contamination from the 23 acre site. (b). Transfer the Citi Field parking lots to that area. (c). Build the 1.4 million square foot shopping mall on the vacated Citi-Field parking lot. (d). Construct commercial elements at Willets Point. This Commission will recall an important element of the 2008 plan was housing. Under the Mets and its Related Companies current plan housing has the least priority and is placed on the back burner until 2025 or almost 17 years since 2008. Furthermore housing will not be built until there is in place so called vehicular ramps to handle the huge increase in traffic. The only vehicular arteries that can service the area are the Grand Central Parkway, Van Wyck Expressway, Northern Boulevard and Roosevelt Avenue, arteries that are choked to capacity and cannot in any way be enlarged to handle a huge increase in traffic. So called ramps to these arteries are akin to the infamous bridge to no where. In short we may have a 1.4 million square foot shopping mall, but no housing,

Do we really need a mall that may will harm hundreds of small businesses on Northern Boulevard, Roosevelt Avenue; Downtown Flushing and the malls on 20th Avenue and Rego Park and elsewhere?

This matter was lawfully before two Community Boards. Board 7 approved the application with a vote of 22 to 18, hardly overwhelmingly. Board 3 rejected it with a 30 to 1 vote with 1 abstention. That means there was a 48 rejection vote with a 23 approval and that is overwhelmingly. At a hearing before Queens Borough President Helen Marshall it was pointed out that pursuant to ULURP section 2-3 as well as common sense principles that require consideration be given to fall out consequences, the impact on Board 3 geographically would be far greater than on Board 7 and that she was required to take that into account, She disputed this. This was followed up with written statements sent to her. Her approval makes it clear she fails to understand the law, her approval meaningless and should be excluded in your deliberations.

Were any or all of the above sufficient to justify rejection of the application, there are other elephants in the room that need to be addressed.

The Commission will note the only ULURP proceeding before it is to seek an amendment to the 2008 approved Willets Point plan so as to construct a parking area on the 23 acre Willets Point area. Apart from the fact as outlined above, you are required to look into any fall out a decision may cause and what the application is really all about, it is clear there is no ULURP proceeding seeking permission for the construction of 1.4 million square foot shopping mall on a vacated Citi Field parking lot. It is the position of the Mets and Related Companies that because of its

1961 lease of the Citi Field property it does not need any permission except from Parks Department to change the area from a parking lot to a huge mall; that ULURP does not apply and communities have no say in the matter. ULURP was enacted in 1975-1976 and is the current law that applies to all those who now seek a land use change. While it is debatable whether the applicant can make such a significant change, what is not debatable is that it must comply with current law and pursue a ULURP process. The other elephant in the room, is the fact Citi Field and its parking lot is located on Flushing Meadows Meadows Corona Park land. It cannot be seriously contested that there is a vast difference in land use between a parking lot on park property and a 1.4 million square foot shopping mall on park property. Yet the applicant contends that under its lease it can do as it pleases with the property and is not required to replace park land if it constructs a shopping mall.

In short, that by pretending all it seeks is a "minor" change to the 2008 Willets Point plan, to wit a parking lot on the 23 acre area, the applicant is attempting an end run around ULURP requirements and replacement of park land. This is unacceptable and if this Commission allows it to happen, it will be making a mockery of the ULURP process that was enacted to require transparency in government

I am not against big business, nor should you be. I am against shady business and dishonest applications as you should be. You should send the word out The City Planning Commission takes seriously not just the word of the law, but the spirit of the law as well. That you will not permit an applicant to attempt to blind side you with a phony claim that all it seeks is a minor change to build a parking area, when in fact it intends to make a major change and construct a 1.4 million square foot shopping mall.

The applicant sought and was given the right to construct the 2008 Willets Point plan you approved. That was 5 years ago and it has done nothing since then. Tell them to go ahead and do the 2008 plan without a mall or walk away and allow another developer to do the job.

Let right be done. reject the application and let the people know you take transparency in government seriously.

Re: Willets Point West Development

Dear Commissioners:

I write to testify *against* the proposed Willets Point West Development in Flushing Meadows Corona Park. I attended the Public Hearing on July 10, 2013 before the Commission concerning the Willets Point West Development. What I heard at the hearing compelled me to add my voice to those opposed to the proposed development. I am a long time Queens resident, I grew up in East Elmhurst and currently live in Rego Park. My family and I use Flushing Meadows Corona Park regularly. I can tell you that while the residents of Queens desperately need every precious inch of Flushing Meadows Corona Park, what we do not need is another shopping mall and/or entertainment center.

One of the supporters of the proposed development testified that Queens residents frequently go outside of Queens to do their shopping in locations such as Rosevelt Field or Woodbury Commons. This statement is simply not credible. The Queens Center Mall as well as the Mall at 63rd Drive and Queens Boulevard, and the Target Mall (also on Queens Boulevard) provide an abundance of retail shopping opportunities for Queens residents in the communities surrounding Flushing Meadows Corona Park. Moreover, all of these shopping areas are easily accessible by public transportation. Any proposed Shopping Mall in Willets Point West would not be so easily accessible by public transportation. Thus resulting in increased traffic congestion in the area. Moreover, given the multitude of retail stores within one mile from the proposed development site, the notion that retail stores such as Nordstrom and/or Macy's would have a presence on the proposed development site is truly fantasy. It is highly unlikely that Macy's would be willing to undercut it's sales from their store in the Queens Center Mall. With regard to Nordstrom, their price point is simply too high to be a viable business in the community.

Truly the proposed development is nothing more than a "land grab" by private investors with deep pockets whose claims of "improving" the community are

questionable at best. This is evident by their now expanded timetable for creating affordable housing as well as their abysmal efforts on behalf of the many businesses currently affected by the original Willets Point Development plan approved by the City Council in 2008. What happens to all these individuals who work hard to support their families is of little concern. Make no mistake the current proposed development is not to benefit the community but solely for the benefit of those who wish to attend events at Citi Field. Indeed, recent news reports on Chanel 11 during Major League Baseball's All Star Week confirmed that the proposed developments which Sterling Equities is trying to push through would allow baseball fans to have the "Manhattan experience" prior to and after attending a game at Citi Field.

The disruption to the community as well as to the users of Flushing Meadows Corona Park by the Willets Point West proposed development can not be stressed enough. Businesses and workers will be displaced, the park will be further divided with the potential for encroaching on even more green space.

My husband and I enjoy riding our bicycles throughout Flushing Meadows Corona Park with our two young children. We usually ride every weekend. The Park provides an excellent space for us to enjoy the outdoors and for the children to practice their cycling skills with minimal fear of vehicular traffic. Not only do we use the Park regularly but so do many members of the surrounding communities as well as people from all over Queens. In fact, many Queens residents use public transportation in order to get to Flushing Meadows Corona Park. On any given day you will encounter folks out for their morning run, families out on bicycles, people taking boating lessons and others playing soccer and cricket. It would be a tremendous disservice to the residents of Queens to rob them of even one acre of this precious space. Indeed, if anything Flushing Meadows Corona Park needs more space *not less*.

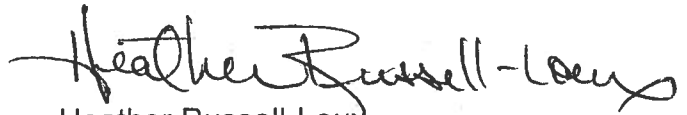

The proposed Willets Point West shopping mall can not be viewed in a vacuum but as part of the larger assault on Flushing Meadows Corona Park. There are currently *three* proposals to permanently annex public park land for private use. The land which is now the old Shea Stadium parking lot was formerly green space which should revert back to green space if it is no longer needed for the original purpose for which it was annexed. The land should not be allowed to be transferred further. In fact, the very thought that it is acceptable to confiscate any amount of park space for the building of a shopping mall, as well as the other proposed developments, *i.e.*, soccer stadium, increasing the USTA's allotment of park space, speaks volumes about the current mayor and our politicians' disregard for minorities and lower income residents of our community. Such a proposal would never have been tolerated much less suggested with regards to Prospect Park or Central Park. Apparently it is fair game to trample on the residents of Queens.

How ironic is it that Mayor Bloomberg wants us to live healthier lifestyles touting us to take the stairs as opposed to using an elevator, but he has no qualms about taking away much needed green space in one of the most heavily used parks in this City. Are the residents of Queens not entitled to healthier lifestyles? Or does our

health, our concerns take a back seat to those who wish to bring the "Manhattan experience" to Citi Field?

As I stated previously, I've lived in Queens all my life. I sincerely hope that in considering the proposed Willets Point West development the Commission will give due consideration to the residents of Queens and what is truly needed in the community. Public access to much needed and highly used green space is vitally important to the residents of Queens. Therefore, I strongly oppose any proposed development which will diminish the available green space now available in Flushing Meadows Corona Park and would advocate that space which was previously annexed if it is no longer needed should be returned as public park land.

Sincerely,

Heather Russell-Loux
